Regulations establishing a four-mile zone for fishing around all of Iceland were issued by the Icelandic government on March 19, 1952. These regulations provided that the straight base lines of the delimited zone be drawn from the outermost points of the coasts, islands and rocks, and across opening bays. All foreign fishing activities were prohibited within a four-mile zone.

Research.—Exploratory fishing craft were employed in many areas throughout the world in 1952 in determining the extent of present fishing grounds, finding new fishery resources and in developing new fishing techniques. In both the United Kingdom and the United States, experiments were conducted to determine the feasibility of using underwater television cameras to locate profitable fishing areas and to study the operation of gear such as otter trawls which are fished on the bottom of the sea. German scientists developed methods of electrofishing in salt water which indicated that it was possible to direct the movement of fish with an electric current so that they could be captured. (See also MARINE BIOLOGY; OCEANOGRAPHY.)

International Fishery Conferences.—International fisheries conferences held during 1952 included those of the Caribbean Fisheries commission in Trinidad, B.W.I., March 24-28; association with the Caribbean Research council; the International Meeting on Fishery Statistics at Copenhagen, Denmark, May 26-31; the fourth annual meeting of the International Whaling commission at London, Eng., on June 3; the first meeting of the General Fisheries Council for the Mediterranean at Rhodes, in the Dodecanese Islands, July 21-24.

North Pacific Fisheries Treaty.—Ratification of the partial treaty for the North Pacific fisheries conservation was voted by the United States senate on July 4, 1952, and was followed by Japanese approval on July 5. Ratification by Canada would bring the treaty into full effect. The fundamental purpose of the treaty, as declared in the convention, was to assure that the high-seas fisheries of the ocean area concerned would be maintained on a maximum sustained-yield basis as one of the world's great sources of protein food.

Canada.—The federal department of fisheries campaign to get Canadians to eat more fish progressed slowly: per-capita consumption in 1949 was 12.87 lb.; in 1950, 13.53 lb.; in 1951, 13.69 lb. There was a sense of urgency about the campaign in 1952, because fishermen landed 600,000,000 lb. of sea fish during the first half of the year; it was the first time since half-yearly figures were recorded that such a heavy catch had been accumulated by the end of June. There was a huge sardine catch, amounting to 21,488,000 lb. by the end of May, compared with 375,000 lb. for the same 1951 period; the 1952 pack by that time totalled 385,790 cases, compared with 53,467 cases for the first five months of 1951. A densely stocked bed of small scallops, discovered in the Northumberland strait in 1950, was in fine condition for fishing. Major aids were given to spawning salmon by the construction of two fishways on the Buckley river aided by a brail and flume system on the Babine river in British Columbia. The Fisheries Research board was active throughout the year with experiments to keep lobsters alive in artificial sea water (and thus expand the lobster-shipping area and the lobster market), to improve fish refrigeration, to find better fishing methods, to control fish predators and to increase the knowledge of size and composition of fish stocks. There were a number of 1952 provincial fisheries developments of interest: the federal government paid Newfoundland fishermen approximately \$840,000 in support of prices of the 1950 catch; Nova Scotia offered loans to fishermen who had suffered from the bad storms of the 1951-52 winter; Quebec and the federal government co-operated to provide long-liner diesel trawlers to Gaspé fishermen at cost; and Ontario experimented with stocking lakes with hybrid game fish.

The total landings of sea fish reached 1,291,733,000 lb. worth 2,660,000; in 1951 landings reached 1,335,696,000 lb. worth 7,730,000,000. (C. Cy.)

Flanders, Ralph Edward (1880—), U.S. senator, was born on Sept. 28 at Barre, Vt. After graduating from high school, he was apprenticed as a machinist from 1897 to 1901. From 1905 to 1910 he was associate editor of the magazine *Machinery* in New York city. He became director and manager of the Jones and Lamson Machine company at Springfield, Vt., in 1912 and later was president (1933-46). A close student of economics, he also became known as an authority on economic planning, serving on various state and national boards, as a member of the industrial advisory board of the National Recovery administration and as president of the Federal Reserve bank, Boston (1944-46).

In 1946 Flanders was appointed to fill the unexpired term of Sen. Warren Austin as Republican senator from Vermont and was elected the following November for the full term 1947-53. He was re-elected in 1952. A member of the liberal Republican group in the senate, he called for a "more progressive" Republican party program. He opposed the foreign policy views of Sen. Robert A. Taft and former Pres. Herbert C. Hoover, but criticized Pres. Harry S. Truman's removal of Gen. Douglas MacArthur. An ardent supporter of Gen. Dwight D. Eisenhower for the Republican presidential nomination, Flanders declared on June 28, 1952, that nomination of Senator Taft would threaten "ruin" for the Republican party.

Flax: see LINEN AND FLAX.

Floods and Flood Control. The U.S. flood control act, approved July 11, 1952, provided \$325,012,800 for flood control work during the fiscal year ended June 30, 1953. The funds were classified as follows: flood control, general, \$255,742,800; emergency fund,

GOVERNMENT CORN STORAGE BINS which burst and crumpled under pressure of corn which became swollen by Missouri river floodwaters near Blencoe, Ia., in April 1952

\$8,000,000; lower Mississippi river, \$60,020,000; Sacramento river, \$1,000,000; Mississippi river emergency fund, \$250,000. Of the flood control general fund, \$243,670,800 was specified for new construction; \$1,650,000 for advance planning, preliminary examinations and surveys; and \$6,112,000 for operation and maintenance. Exclusive of the lower Mississippi river and the Sacramento river, flood control construction was continued or begun on 72 projects in 30 states. The \$60,020,000 allotted the lower Mississippi river project was designated for work in 7 states: Kentucky, Illinois, Tennessee, Louisiana, Missouri, Arkansas and Mississippi.

Congress also appropriated \$1,600,000 for a general survey, \$465,000 for the Arkansas-White-Red river basin survey and \$410,000 for the New England-New York survey.

Dams and reservoirs placed wholly or partly in operation during the 1952 fiscal year included the Mansfield Hollow reservoir, Connecticut; the Harlan County reservoir, Nebraska; Cagles Mill reservoir, Indiana; Whitney reservoir, Texas; Tenkiller Ferry reservoir, Oklahoma; Mount Morris reservoir, New York; Pine Flat reservoir, California; and the Albeni Falls reservoir, Idaho. Local protection projects placed in operation included the projects at Portville, N.Y.; Olean, N.Y.; Mount Clemens, Mich.; Hoosick Falls, N.Y.; Adams and North Adams, Mass.; Amazon Creek, Ore.; and Milton-Freewater, Ore.

Floods occurred in many of the nation's major river basins during the year. The most devastating was that of March-April in the Missouri river basin. Flooding on the main stem was caused mainly by excessive local runoff and inflows from the flooded tributaries, as a result of the sudden thawing of a relatively heavy snow cover. Ice jams were important contributing factors in North Dakota. As the flood moved down the Missouri, it surpassed all previous records, including the historic flood of 1881. Because of its long crest and enormous volume, estimated at 10,000,000 ac.-ft., flooding of the more vulnerable points downstream often preceded the crests by nearly a week. Major flooding occurred at Sioux City, Ia., and points below. All privately built farm levees were overtopped in the reach between Sioux City and Kansas City, Mo. Three of the federal agricultural levees between Omaha, Nebr., and Kansas City were overtopped. To protect the cities of Omaha and Council Bluffs, Ia., one of the greatest flood fights in history was waged. In the fight that saved these cities from inundation, the corps of engineers, its contractors and army troops put in nearly 1,500,000 man-hours of work. Approximately 5,000,000 sandbags were used, 800,000 ft. of lumber and about 100,000 tons of stone. At the peak, about 25,000 people took part in all phases of the levee defenses at Omaha and Council Bluffs. Estimated damage caused by the flood was \$179,000,000. Total damage prevented by existing flood control works amounted to an estimated \$238,580,000.

The flood that occurred in April 1952 on the Mississippi river above Keokuk, Ia., was the highest on record and came from snow melt in central and southern Minnesota. Large floods occurred on the Mustinka, Sand, Elk, Crow, Rum and Minnesota rivers. Estimated damage caused by the flood was \$20,517,000, with \$9,000,000 in Minnesota alone. Damage prevented amounted to an estimated \$41,010,000.

Heavy rainfall fell over the state of New Jersey on March 11 and 12, 1952, with heaviest concentration along the watersheds of the northern tributaries of the Passaic river. The heavy runoff accompanying the storm caused total damage estimated at \$468,000. The Passaic river was in flood stage again on April 5-6, and a third flood occurred in the basin on June 1-2. Total damage in the Passaic river basin from these two floods amounted to \$1,694,500.

Floods also occurred in southern California during Jan. 1952.

The major stream basins affected were Los Angeles river, Gabriel river, Rio Hondo and Baloota creek. The principal types of property damaged by the flood were industrial, business, residential, street, highway and railroad. Estimated damage from floodwaters was \$4,510,000. The damage prevented by existing improvements was estimated at \$20,200,000. (G. H. B.)

Other Countries.—The year 1952 was remembered for severe flooding in the west of England which overwhelmed small north Devon seaside resort of Lynmouth, and the surrounding area, during the night of Aug. 15. The primary cause of the flooding was the phenomenal rainfall that occurred on moor and other districts of Somerset and Devon. At Longst Barrow, which stands at a height of 1,500 ft. along the north watershed of Exmoor, 4 mi. from Lynmouth, the rainfall during 24 hr. was 9 in., of which 5 in. fell in 5 hr. At Oakhampton on the north edge of Dartmoor, the fall amounted to 4.25 in. A heavy rain was associated with a shallow but slow-moving depression along the English channel, and the upper air conditions favoured rainfall of thundery intensity, while the height of moor and Dartmoor caused the rainfall to be concentrated on a relatively small area. In all, the floods struck an area of north Devon and Somerset from Dunster to Tiverton, South Molton and Lynton embracing more than 250 sq.mi. Public utilities services and numerous properties were damaged or demolished in many villages, and 18 bridges were either carried away or extensively damaged, thus restricting transport and hampering relief work. The full extent of the damage was estimated at £3,000,000 to £5,000,000. The number of persons immediately made homeless was 900, and the final death toll was 31, which represented the worst flood disaster in Great Britain since the beginning of the century. Subscriptions to a national relief fund exceeded £1,000,000.

The early part of August was unusually wet and flooding occurred in other parts of Great Britain as a result of thunderstorms. Many places had up to 2 in. of rain during a week and more than 3 in. was recorded at Douglas, Isle of Man. In Cumberland and Yorkshire several roads were impassable, and a large area of grain crop was flattened in Argyllshire. At Blackpool heavy seas damaged boats and buildings on the front, and thousands of acres of low-lying land on the shores of Morecambe bay were flooded. In Belfast, after 30 hr. of rain, the Blackstaff river overflowed its banks causing the worst flooding in living memory. About 2,000 houses were affected and more than 100 ac. in the Donegal road area of the city were inundated.

During the year further consideration was given to severe flood protection schemes, the largest being that dealing with the Great Ouse river which included the provision of works from Lynn down to the end of the training walls, the estimated cost of the works being £6,000,000. Preparations were begun for a £160,000 scheme to prevent flooding at Gainsborough, Lincolnshire. Fleetwood corporation approved a scheme for coastal protection at an estimated cost of £250,000 planned to be constructed over a period of three to four years; and at Selsey, Sussex, a sea defense project was considered, estimated cost £500,000.

Commonwealth.—The Ontario, Can., government announced in July that approval had been given to the construction of the Glen Allen dam, about 53 mi. above Galt, for the control of floods on the Conestogo river. The dam would form a reservoir with a surface area of 3 sq.mi. and was estimated to cost \$5,000,000.

In New South Wales, Austr., floods in June caused the formation of a lake about 60 mi. long and 50 mi. wide, about 20 mi. southwest of Forbes. Further floods in August resulted in the fifth major flood in five years at Maitland, and kept 2,000

people out of their homes.

In the suburbs of Bombay the heaviest July rainfall in 30 years was experienced. With more than 12 in. in 24 hr., and more than 6 in. between 6 A.M. and 8:30 A.M., the estimated maximum intensity was computed to be 4 in. an hour. The downpour disrupted air, railway and road traffic, and people in the low-lying areas of the city were forced to seek shelter in the upper floors of buildings. Also in July, heavy rain in the hills caused the Brahmaputra river and its tributaries to rise, and floods spread over upper and lower Assam. In West Bengal, the town of Alipier Duar was partly under water. In August, floods again occurred in Assam when the Brahmaputra river rose and flooded eight island villages. In Bihar it was reported that the state had suffered severe damage from drought in the south, and floods in the north; while 12,500,000 people were affected by drought within an area of 18,000 sq.mi. in south Bihar, crops were seriously damaged and 500,000 people were seriously affected by floods in the Kosi river valley in north Bihar. Flooding of the Gumti river, southeast of Dacca (East Pakistan), occurred in July and affected between 25,000 and 30,000 people, sweeping away large areas of rice paddy and jute fields.

Algeria.—In September, the Zarour river rose more than 18 in. in a few minutes when a cloudburst, lasting for about half an hour, occurred over the town of Tebessa in the region of Constantine. The tempestuous torrent swept away mud huts, brick houses, trees and cattle, and 25 persons were reported drowned. The plain of Merdzah, which stretches before the gates of Tebessa, was completely submerged.

Spain.—Heavy rains and floods in Navarre damaged crops and livestock estimated at £200,000, and at Allo 3 persons were drowned and 400 cut off by floods. (See also DAMS; DISASTERS; IRRIGATION; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION; TENNESSEE VALLEY AUTHORITY.) (J. Kd.)

Florida. The extreme southeastern state of the United States, Florida was admitted to the Union in 1845 as the 22nd state. It is called the "Sunshine state," and sometimes the "Peninsula state." Its coast, not taking into account the numerous bays and indentations, is greater than that of any other state, extending about 472 mi. along the Atlantic and 14 mi. along the Gulf of Mexico. Area: 58,560 sq.mi., of which 298 sq.mi. are water surface; population (1950 U.S. census) 771,305, an increase of 873,891 or 46.1% over that of 1940. Of this population 1,813,890 were urban dwellers and 957,415 were rural; 2,166,047 were white, 605,258 were nonwhite. The cities of more than 25,000 people in 1950 were: Miami, 249,766; Jacksonville, 204,517; Tampa, 124,681; St. Petersburg, 117,738; Orlando, 52,367; Miami Beach, 46,282; Pensacola, 43,799; West Palm Beach, 43,162; Fort Lauderdale, 36,328; Lakeland, 30,851; Daytona Beach, 30,187; Tallahassee (the capital), 23,737; Gainesville, 26,861; Key West, 26,433; Panama City, 23,814. On July 1, 1951, the state's population was estimated at 801,000.

History.—The state elective administrative officers in 1952, whose terms expire in Jan. 1953, were: Fuller Warren, governor; R. A. Gray, secretary of state; Richard W. Ervin, attorney general; C. M. Gay, comptroller; J. Edwin Larson, state treasurer; Thomas D. Bailey, superintendent of public instruction; Nathan Mayo, commissioner of agriculture. Dan McCarty of Fort Pierce received the Democratic party nomination for governor in the May primaries to succeed Governor Warren in Jan. 1953.

At the general election Nov. 4, 1952, the people voted on proposed amendments to the state constitution. One of these provided that part of the revenue from motor car licences

NEW CLUBHOUSE for the Gulfstream park race track, Hallandale, Fla., first opened in 1952

should be used for capital outlay and debt service for school purposes. Another would increase the number of state supreme court justices from seven to ten. Another provided for the granting of county charters by the legislature. Two proposed amendments would provide for an increase of two state senatorial districts, thereby increasing the size of the state senate from 38 to 40.

The 1951 legislature amended the homestead realty tax exemption law to the effect that a person must be a legal resident of the state for one year prior to making applications for homestead exemption to receive this benefit. The state supreme court declared this act unconstitutional.

Education.—Enrolment in the public schools for the year 1951-52 in grades 1 through 12 was as follows: white, 424,558; Negro, 129,412; total 553,970. Kindergartens: white, 2,821; Negro, 145; total 2,966. Junior colleges (grades 13 and 14): white, 1,026; Negro, 138; total 1,164. There were 1,273 elementary and 715 secondary public schools, 46 kindergartens and 5 junior colleges in the state, of which there were 767 white and 506 Negro elementary schools, 485 white and 230 Negro secondary schools, 44 white and 2 Negro kindergartens and 4 white and 1 Negro junior colleges. These schools had instructional staffs (exclusive of 202 supervisors) of 18,997 teachers and 851 principals, of whom 14,444 teachers and 683 principals were employed in schools for whites and 4,553 teachers and 168 principals were employed in schools for Negroes.

Social Insurance and Assistance, Public Welfare and Related Programs.—Florida disbursed for state welfare through the state welfare board \$43,421,390.92 in 1951-52. From grants by the federal government the state received in 1951-52 for old-age assistance \$19,763,700.83; for dependent children \$7,545,465.83; and for aid to the blind \$994,326.48; total \$28,303,493.14. Disbursements for old-age assistance were \$31,369,825.47; for dependent children \$10,450,359.31; and for the blind \$1,601,206.14; total \$43,421,390.92. Administrative and other welfare services amounted to \$2,672,630.21 which included \$1,245,993.84 in federal funds. The unemployment benefits receipts were \$11,125,833.35 with net benefit payments of \$7,124,770.05. The appropriations for prisons and other institutions for 1952-53 were: the prison at Raiford \$963,565; the prison farm at Belle Glade \$309,720; the industrial school for boys at Marianna \$408,714; the industrial school for girls at Ocala \$127,700; the Apalachee Correctional institution \$226,500; the Female Correctional institution at Forest Hill near Ocala \$75,000. The state supports state hospitals for the insane at Chattahoochee and Arcadia, the Florida Farm colony for the feeble-minded at Gainesville, and the Florida School for the Deaf and Blind at St. Augustine. The appropriations for these institutions for 1952-53, including capital outlay, were \$6,686,350, \$614,280 and \$521,950 respectively.

Communications.—The total highway and street mileage in the state at the end of the year 1951 was 51,915 mi., of which 21,923 mi. were paved and 3,837 mi. were hard surfaced with gravel or stone. Disbursements for the calendar year 1951 were \$58,617,751.49 for construction and \$9,944,151.97 for maintenance. The state road department's budget for the year 1952 amounted to \$110,387,200 for construction and \$7,758,720 for maintenance. Florida had in 1952 approximately 5,000 mi. of railroads exclusive of yard tracks.

Banking and Finance.—On June 30, 1952, there was a total balance in the state treasury of \$82,506,649.64 with outstanding warrants of \$13,108,010.94. The state is constitutionally forbidden to incur a debt by borrowing except to put down insurrection and repel invasion. The constitution also prohibits the legislature from levying an income tax, forbids

Table I.—Principal Crops of Florida

	Indicated 1952	1951	Average, 1941-50
Corn, bu.	9,236,000	9,616,000	7,378,000

any state ad valorem tax on real estate and exempts homesteads from taxation by local taxing units up to the value of \$5,000.

On June 30, 1952, there were within the state 63 active national banks with total deposits amounting to \$1,528,697,000 and 141 state banks and trust companies with deposits of \$754,432,212.76, representing total deposits of \$2,283,129,212.76, a gain of \$243,553,149.86 in the fiscal year.

Agriculture.—The sale of citrus products amounted to \$169,527,000 for the year 1951. The sale of truck crops, including strawberries, for the year 1951 amounted to \$127,025,000. On Jan. 1, 1952, the livestock resources of the state were as follows: 1,250,000 beef cattle and calves; 149,000 milk cows; 610,000 swine; 3,000 sheep; 27,000 horses; 25,000 mules.

The total income from the sale of agricultural commodities for the year 1951 was \$507,211,000. This included income from the sale of cattle and hogs \$51,394,000; poultry \$27,079,000; dairy products \$38,590,000; truck crops \$127,025,000; citrus \$169,527,000; greenhouse and nursery products \$22,615,000; and from field crops: tobacco \$23,302,000, potatoes \$12,578,000, corn \$1,079,000, sugar cane for syrup \$1,012,000, sugar cane for sugar \$8,939,000, cotton \$5,535,000 and peanuts \$5,271,000.

Manufacturing.—The value added by manufacturing in Florida increased from \$350,000,000 in 1947 to nearly \$440,000,000 in 1950, an increase of one-fourth in contrast to a one-fifth rise nationally. The total number of manufacturing employees rose by 11% from 1947 to 1950, compared with 0.5% for the nation.

National defense contracts, amounting to about \$116,000,000 from July 1, 1950, to September 30, 1951, were a great stimulus to industrialization in Florida.

There was also a great growth in the number of business firms. The number of all Florida business companies, both manufacturing and non-manufacturing, increased from 48,000 in 1944 to 91,000 in 1951, a rise of 89% compared with 32% for the nation. In Jan. 1952 the total manufacturing employment reached 112,800, which was 12.5% more than the number in 1950. (A. N. P.)

Mineral Production.—Table IV shows the tonnage and value of those mineral commodities produced in Florida in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet

Table IV.—Mineral Production of Florida

(In short tons, except as noted)

Mineral	Quantity 1950	Value 1950	Quantity 1949	Value 1949
Clays	127,000	\$1,955,000	96,000	\$1,447,000
Petroleum (bbl.)	487,000	"	441,000	"
Phosphate rock	9,056,000	45,378,000	7,633,000	37,858,000
Sand and gravel	2,794,000	2,807,000	2,244,000	1,880,000
Stone	5,313,000	6,885,000	4,215,000	4,748,000
Other minerals	"	10,692,000	"	9,085,000
Total	"	\$67,717,000	"	\$55,018,000

*Value included with other minerals.

available. Florida ranks first among the states in the production of phosphate rock and ilmenite, and stands 28th in the value of output, with .57% of the U.S. total.

Flour. **Flour Production.**—Commercial wheat flour production in 1951 for the U.S. totalled 239,300,000 sacks (100 lb. each), an increase of 2% over the 224,900,000 cwt. of 1950. Wheat ground into flour amounted to 535,200,000 bu., compared with 523,400,000 bu. for the previous year. Wheat

flour mills in 1951 operated at 79.9% of capacity, compared with 78.6% in 1950.

Rye flour production also registered an improvement amounting to approximately 2,292,000 cwt., a gain of 5% above the previous year's total.

Flour milling statistical data compiled by the U.S. bureau of the census are based on reports from mills having a day (24-hr.) capacity of 401 sacks and more, representing more than 97% of the total U.S. capacity. During 1951, 22 mills reported that they were going out of business, 13% of the number being in the 401 to 800 cwt. per day capacity group.

Flour Improvement.—A comprehensive survey by C. Harrel of the various methods and processes for achieving improvements in the baking characteristics of bread, cake and cookie flours was published in *The Baker's Digest*, May and June 1952. His study included references to 39 important technical sources and to 11 textbooks on the bleaching and maturing of flour. The survey dealt principally with the beneficial effects produced by various bleaches such as chlorine, chlorine dioxide, nitrogen trichloride, benzoyl peroxide and other commercially useful maturing agents.

Sanitation.—Sanitation standards for flour handling equipment as recommended for use by bakers and other commercial users of flour were developed by the Baking Industry Sanitation Standards committee. The recommendations of the committee were made available in a 13-pp. booklet, published June 1, 1951, which described the general principles of design and construction for practically all standard devices for the storage, moving and handling of flour.

Flour and Bread Enrichment.—By 1952, 26 states in the U.S. had supported the enrichment program with compulsory legislation, and in practically all other states a very high proportion of flour and white bread continued to be enriched with vitamins and minerals on a voluntary basis. (See Z. I. Kertesz, *Food Technology*, July 1952.) The Millers National federation and the American Bakers association were continuing their wholehearted support of the enrichment program. A complete report on the status of flour and bread enrichment was available from the National Research council.

Flour Specifications for Prepared Mixes.—George Garnatz, chairman of the Flour Specifications panel of the American Association of Cereal Chemists, enlisted the aid of prominent cereal mix manufacturers in specifying flour types or blends best suited to four different types of mixes, based on leavening as follows: (1) chemically leavened; (2) yeast leavened; (3) not leavened; and (4) not leavened (pie crust). In general the basic types of flour were employed in mix formulations: (1) soft wheat flour, for cake, doughnut, pancake and waffle, biscuit, muffin, cookie and pie crust mixes; (2) hard wheat flour, for bread, hot roll, raised doughnut and coffee cake mixes.

Flour Characteristics for the 1952 Hard Winter Wheat Crop.—The Southwest Cereal Chemists crop reporting committee issued its final report for the 1952 crop, with comments on the following flour characteristics: mixing time, fermentation time, absorption, floor time, proof, malt requirements, yeast food requirements, loaf volume, ash and protein. On the average it appeared that the protein content would be somewhat lower and that the mixing time would be correspondingly shortened, perhaps by as much as 30% in some cases. (*American Baker*, Aug. 1952, p. 12.)

Flour Technology.—Numerous scientific reports on various phases of flour technology appeared throughout the world technical literature, practically all of which were summarized and reported in various abstracting publications such as *Biological Abstracts*, *Chemical Abstracts* and *The Baker's Digest* abstract section. Typical of the more recent and reliable

cial on flour and flour milling technology was C. G. Harrel's article on "Maturing and Bleaching Agents Used in Producing Flour," a review prepared to serve as a source of information for professional men, students, educators and housewives. (*Industrial and Engineering Chemistry*, vol. 4, no. 1, pp. 95-100, 1952.)

Great Britain.—During 1952 there were no outstanding changes in milling and baking. In Great Britain the extraction rate of flour remained unchanged at 81% but, with the incorporation of the normal amount of whiter imported flour, bread for the public was, to all intents and purposes, made from 80% white flour. In other words, from 100 parts of wheat 80 parts of flour were obtained as opposed to about 72 parts obtained prior to World War II. The higher percentage, of course, resulted in the bread being darker.

Some minor relaxation of controls in bread manufacture took place, wrapped and sliced bread being quite commonplace. The character of bread is largely dependent on the nature of the flours used, but again there was little change during the year. Canadian and English wheat represented the bulk of the wheats used. In prewar days no less than 40 countries sent wheat to Great Britain, but by 1952 the number was 5.

In the training of bakers attention was being given to the underlying sciences involved so that greater economies could be effected and efficiency improved. In spite of many difficulties the quality of bread remained at a high standard and a compromise was reached between colour and nutritive value although it might still be advisable to make alterations in the future. Enrichment of bread with added vitamins, practised in the U.S. and other countries, did not spread to any extent to Great Britain. (See also BREAD AND BAKERY PRODUCTS; WHEAT.)

Football. Not all the news of United States intercollegiate football came from the playing fields in 1952. Following severe criticism of 1951, when schools were accused of going to any lengths to obtain athletes, a special committee of college presidents was appointed by the American Council on Education to investigate the evils undermining sports and make recommendations to aid in a general cleanup. The group, headed by John A. Hannah, president of Michigan State, was disbanded in November after almost a year of research, but before some progress toward reform had been made. Hannah's committee reported that the chief evil was the granting of scholarships in wholesale lots to stars, regardless of their previous schooling, and then allowing those athletes to slide through

four years of college by taking useless courses.

Following the recommendations of the committee, a number of leagues abolished spring training and barred postseason contests as steps toward de-emphasizing the game. Members of the Eastern (Ivy) league, which earlier had banned bowl games, signed an agreement limiting spring work and putting the scholarship requirements for athletes on the same plane with those for other students.

The Big Seven also barred postseason games, and several of the smaller schools dropped football completely. Many schools were looking into their athletic finances following another recommendation by the Hannah committee that all scholarship funds be handled by the universities, which would eliminate unqualified men from receiving aid directly from booster clubs.

Television remained a controversial problem. The National Collegiate Athletic association television committee, whose previous survey had found that telecasting on an open basis had cut into attendance, recommended a course of moderation, and restrictions were maintained during 1952, following the limited program tried the year before. One major contest a week was telecast, although in several instances stations were allowed to review a game locally. Attendance at the majority of colleges stayed up and gained in some places, although that at the smaller schools dropped considerably.

A number of rule changes, mostly designed to discourage unnecessary roughness, were made by the college rules committee. Illegal use of hands or forearms in blocking, which called for a 15-yd. penalty, also carried a mandatory suspension for a flagrant offender. Clipping was redefined so that blocking an opponent in any manner from behind became a violation. The former rule limited clipping to throwing the body across a rival's back below the waist. The penalty for an illegal shift was increased from 5 to 15 yd. Another major change was the increase from 5 to 15 yd. for holding when incurred by a defensive player.

The 1952-53 season had a preview on Aug. 15, when the Los Angeles Rams, defending champions of the National league, defeated the College All-Stars, 10-7, at Soldier Field, Chicago, Ill. The usual number of upsets marked the early college season and as football moved into November only five teams, Michigan State, Georgia Tech, Maryland, Southern California, and the University of California at Los Angeles, remained undefeated and untied among the major colleges. Princeton, with the longest winning streak carried over from 1951, added a 14-0 victory over Columbia and routed Rutgers 61-19, to extend its string through 24 encounters, then met defeat at the hands of Penn on Oct. 11 by a 13-7 count as 40,000 looked on. Penn, after tying a greatly improved Notre Dame eleven, 7-7, and stopping Dartmouth, Princeton and Columbia, was held to a 7-7 deadlock by Navy and then was surprised by a strong Penn State squad, 14-7, in one of the year's upsets. Maryland, with a good record carried over from 1951, swept aside Missouri, Auburn, Clemson, Georgia and Navy to enter the November stretch with 19 consecutive triumphs. Following the setback of Princeton by Penn, Michigan State's Spartans found themselves in possession of the longest winning streak in college football and were rated in every poll as the top team of the nation. Michigan State started its drive with a 27-13 decision over Michigan before 97,239 at Ann

EVAN SLONAC of Michigan State college leaping over fallen players after receiving a pass in the game with Pennsylvania State college played at East Lansing, Mich., Oct. 25, 1952. Michigan State won 34 to 7

Arbor, then toppled Oregon State, Texas Aggies, Syracuse and Penn State for 21 consecutive triumphs. With a month to play, most of the conference races were far from over. Penn, unbeaten by an Ivy league foe, and Princeton, halted only by the Quakers, were still duelling for the Eastern league title. Undefeated and bowl-bound Georgia Tech and Tennessee were pacing the southeastern group and Texas, undefeated in the Southwest conference, appeared on the way to the top of its circuit. Idaho State captured the Rocky Mountain laurels, and Utah and New Mexico were battling for the honours in the Skyline group. Michigan and Wisconsin, with only one loss each in the Western conference, were leading contenders for the Big Ten crown and the right to play in Pasadena's Rose Bowl. Meanwhile two coast titans, Southern California and U.C.L.A., were running unbeaten in an interesting battle for the Pacific coast crown and the opportunity to face the Big Ten winner on Jan. 1, 1953. Oklahoma and Missouri showed the way in the Big Seven and Duke was pacing the Southern conference although pressed by West Virginia, which furnished one of the campaign's upsets when it stopped an improved Pittsburgh eleven, 16-0.

Professional Football.—Close races developed in both the American and National conferences of the National Football league. The Cleveland Browns, although surprised by the New York Giants, 17-9, at Cleveland, Oct. 1, loomed as the champions of the Eastern half of the circuit although New York and Philadelphia had not been eliminated. Detroit, San Francisco and Green-Bay, Wis., were all in the running for the Western crown. With attendance up at the many preseason exhibitions, the league looked for a big year at the turnstiles although the new Dallas club proved disappointing. The Texans, who had replaced the New York Yankees in the National conference, failed to win any of their first eight starts, and drew little support at their home games. The future of the team, which was to finish

its season on the road, was to be decided at the league's convention. (For bowl game scores, Jan. 1, 1953, see p. 16.)

Canadian Football.—Attendance was on the rise in the part of the campaign. The East's Interprovincial Rugby union, popularly known as the Big Four, was paced by the Hamilton Tiger-Cats, with the Toronto Argonauts running second. Toronto and Western shared first place in the race for Canadian collegiate laurels. Vince Mazza, stellar tackle of the Hamilton Tiger-Cats, was the recipient of the Jeff Russell Memorial trophy awarded annually to the most valuable and sportsmanlike player of the Big Four. The schoolboy season was featured by the defeat of a United States eleven to Montreal on Oct. 27, when the Westmount High School team defeated Proctor Academy, Andover, N.H., 22-5. Canadian rules applied to the first half of play and United States rules were followed in the second half.

(T. V. M.)

Great Britain.—*Association.*—England and Wales shared the British international championship by drawing with each other and beating Scotland and Ireland. England's team made a continental tour in which it drew 1-1 with Italy at Florence, Austria 3-2 at Vienna and beat Switzerland 3-0 at Zürich.

In the British amateur international tournament, Scotland was successful, beating England 2-1 at Wembley, Ireland 2-0 at Glasgow and Wales 3-2 at Inverness. Newcastle United became the first club to retain the Football association cup since Blackburn Rovers' two wins in 1890 and 1891. Walthamstow Athletic beat Leyton 2-1 in the Football association amateur cup and Oxford beat Cambridge 2-1 in the university match.

Manchester United provided one of the biggest surprises, losing 0-2 at home in their first game to Hull City, a second division team captained by the veteran H. Carter; but later at last won full reward for being the most consistent side in the country since the war by winning the Football league championship by four points from Tottenham Hotspur, the holders, and Arsenal.

Libernian retained the Scottish league title. In the Scottish competition, the cup went to Motherwell. This was Motherwell's fifth final but only its first victory there. (For association football in the U.S., see the article SOCCER.)

Rugby Union.—The 1951-52 season was made notable by two striking teams, the South Africans in the British Isles and France and the Fijians in Australia.

The South Africans played 31 matches, winning 30, losing 1 to London Counties (9-11) and scoring 562 points against them. The Fijians startled Australia by beating club and state sides by brilliant and ceaseless open attack of the most unorthodox kind and losing once and winning once against the full Australian team. Australia also visited New Zealand and each won one of the two international matches.

Wales won all its four matches in the British home international championship and so won the Triple Crown for the first time. Wales beat England 8-6 at Twickenham, Scotland 10-3 at Cardiff, Ireland 14-3 at Dublin and France 9-5 at Wembley. England, Ireland and France were much inferior to Wales and much superior to Scotland. England beat Ireland by 13-0 in a blizzard at Twickenham, beat France by 22-0 by a try in Paris and beat Scotland 19-3 at Murrayfield. Wales beat France 11-8 in Paris and beat Scotland with 14-0 for 3 parts of the game by 12-8 in Dublin. France won 11-0 at Murrayfield.

Middlesex won the county championship, beating Lancashire in a final at Twickenham. Oxford won its fourth successive trophy over Cambridge in Dec. 1951 by 13-0.

Rugby League.—The New Zealand team which visited Great Britain in the 1951-52 season lost 10 of its 28 matches, including all three tests at 15-21, 19-20 and 12-16. Australia sent a team to England in the autumn and lost the first test 6-19.

France retained the home international title on points averaged over Other Nationalities and England.

Wigan won the Northern Rugby league title for the fourth time since the war and the eighth in all, beating Bradford Northern, which had finished top in ordinary games, by 13-6 in a final. Workington Town in 1951 was the first club outside Lancashire and Yorkshire to win the Northern league title, and in 1952 it became the first outside the two counties to win the Challenge cup, beating Featherstone 18-10 in the final at Wembley. Foreign Investments. **United States Investments Abroad.**—The value of United States private and government investments in foreign countries amounted to \$36,824,000,000 on Jan. 1, 1952, a rise of about \$10,000,000 over the same date a year earlier. By the end of 1952 their value had probably increased by an additional \$10,000,000 to \$1,500,000,000, reflecting a net outflow of United States private and government long-term capital of \$725,000,000 and \$1,000,000,000, respectively, and the reinvestment of foreign subsidiary earnings. Most of the movement of private capital, \$1,000,000,000, was in the form of direct investments and re-established important U.S. managerial interests in the recipient enterprises. The balance was in portfolio securities involving no important voice in the management of foreign enterprises.

Direct Investments.—The increase in foreign investments in the first half of 1952 roughly paralleled new plant and equipment expenditures in the United States. The high rate of both foreign and domestic investment indicated a continued need for

raw materials and processing facilities. This need was reflected in the flow of capital to Canada.

In 1950 about 38% of the overflow of U.S. direct-investment capital went to Canada. During the next year the proportion rose to 45% and probably was the same or higher in 1952. In dollar terms, the net movement of about \$250,000,000 invested in Canada during the first six months of 1952 was only 10% below the total for the year 1951. Of these sums, probably three-quarters went into petroleum and mining ventures during 1951-52 compared with 65% in 1950.

Although the investment of U.S. and other funds had been vast in the province of Alberta, the production of crude oil during 1952 was held in rein by the lack of adequate transportation. Work was in progress during the year on a partly U.S.-financed \$82,000,000, 24-in. pipe line extending 695 mi. from Edmonton to Vancouver, B.C. This would supplement an earlier U.S.-financed line to the Great Lakes that carried Alberta oil to eastern markets.

In April the Alberta legislature approved the export of natural gas. Shortly thereafter it was announced that a U.S.-financed pipe line costing more than \$110,000,000 would be built to carry the gas from that province to northwestern United States. Meanwhile nearly all the major U.S. oil companies were engaged in expending sizable sums exploring for oil and natural gas in the neighbouring province of Saskatchewan.

In the eastern tip of Canada, U.S. funds were expended on the 360-mi. railroad being built across the rugged area between the St. Lawrence river and Labrador—often in temperatures to -40° F. The rail line, when completed in 1953, would unlock a vast area of rich iron ore which U.S. stockholding firms in the enterprise intended to purchase.

Continued investments were also made in the development of lightweight metals. The U.S. investment in a major titanium mining, smelting and transportation project appeared to have been completed during 1952. During the second half of the year, Aluminum Company of America announced its intention to build smelting and electric-power facilities in the Canadian northwest, the cost of which might run from \$400,000,000 to \$700,000,000. Relatively cheap electricity produced by water power would be used to smelt aluminum from ore brought by ship from South America. The raw aluminum would then be shipped to the United States for processing.

Celanese Corporation of America, the world's largest producer of yarns and fibres made from cellulose acetate, announced in 1952 that in addition to its Canadian pulp-making operations it would process the pulp in Canada into flake and yarn. In this and in other ventures the company and others might invest approximately \$100,000,000.

In addition to these large and frequently spectacular projects, United States-controlled enterprises made investments in many other enterprises in Canada, particularly in manufacturing. These included electronics equipment, television sets, materials-handling and road-building machinery, aluminum building products, flour mills, fish processing and a mail-order business and retail-store chain.

It was believed that the inclusive United States ownership of Canadian industry—mining, petroleum, public utilities, railroads, merchandising and manufacturing—was probably less than one-quarter of the total investment in these industries in 1952. United States investments in Canadian manufacturing rose from about \$950,000,000 in 1926 to \$2,300,000,000 in 1951 and were at their highest point in history in 1952. The existence of this stake and the addition of annual new investments contributed to an increase in the volume of merchandise exchanged by the two countries.

The flow of United States direct investment capital to Latin

Note: No allowance has been made for direct investments damaged during World War II, written off, or expropriated without compensation. Holdings of portfolio securities of former enemy countries, or countries where no realistic valuations were obtainable, have been excluded.

America approximated \$175,000,000 during the first six months of 1952 compared with \$187,000,000 for all of 1951. Important additions were made in manufacturing in Brazil and Mexico, in distribution in the latter country, in copper-refining capacity in Chile, in iron-ore mining in Venezuela, and in international shipping and tanker companies flying the Panamanian flag.

Among the investment actions receiving publicity were: an announcement in May that a group of independent oil companies in Texas was prepared to invest \$40,000,000 in developing Bolivian oil, a new oil act that gave Peru a 50-50 share of all profits from oil produced by foreign interests, and the likelihood that the American Smelting and Refining company would invest \$75,000,000 in copper mines in the same country. In July that company announced the suspension of its copper-mining subsidiary in Bolivia, citing prolonged unsatisfactory labour relations and a poor economic outlook as the reasons.

At the beginning of 1952 investors were considerably disturbed by a Brazilian presidential decree that the law affecting the export of profits from that country had been misinterpreted. Pres. Getulio Vargas stated that while earnings equal to 8% of foreign capital could be exported, earnings over that figure had been erroneously allowed to be added to original investments by the Bank of Brazil and later remittances of profits figured on that increased capital.

Under the decree, reinvested earnings (more than 8% of foreign capital) were regarded as capital not enjoying the right of repatriation (20% a year of foreign capital may be repatriated) and could not be taken into account in figuring remittances. Moreover, all past remittances of income exceeding 8% of invested foreign capital must be deducted from future remittance quotas. The right to future remittances was lost by enterprises whose past remittances had exceeded their foreign capital plus the 8% relative to earnings.

President Vargas claimed that of about Cr.\$ 25,100,000,000 of foreign capital registered with the Bank of Brazil in 1950, only Cr.\$ 9,400,000,000 could be considered as capital actually brought into the country and that the balance represented profits which were not remitted and which had been incorporated into capital. The official rate for the cruzeiro had been 5.4406 cents (U.S.) for a number of years. The United States department of commerce estimated that income received from U.S. direct investments in Brazil was about \$83,000,000 in 1951. If enforced, the 8% limit as expressed by President Vargas would have reduced this figure considerably.

To meet the problem faced by investors, the Brazilian government prepared a bill during the summer of 1952 that was designed to solve the question of taking profits on foreign investments out of Brazil, by providing a free market in foreign exchange parallel with the official one in which the rates were rigidly controlled. Under this bill foreign capital, profits and

dividends could be traded in the new market while, U.S. nationals reported to have made investments in Brazilian manufacturing in the first 1952. However, it was known to what extent blocking of remittances reflected in these figures.

United States investments in other countries also increased in the first half of 1952, compared with the previous period, petroleum development being as one of the chief

tions. The Indian ambassador to the United States, Biju Pan Sen, urged U.S. investments in India. The first type of investment in India that the ambassador outlined envisioned participation in consortia, supporting various Indian industries rather than the same industries in which the U.S. company was involved at home. Participation either should be in finance or the supply of goods, he said, recommending government participation as a guarantee of confidence.

The ambassador was also reported to have recommended formation of an investment company in which both U.S. and Indian capital would participate initially on a 70%-30% basis. He suggested that at the end of a ten-year period the proportion might shift to 30% U.S. capital and 70% Indian.

Liquidations.—Two U.S. oil companies were reported to have withdrawn their interest in commonly owned refinery and petroleum distribution facilities in Argentina and sold the properties to the Argentine government for \$5,400,000. In Egypt the remaining U.S. company engaged in the exploration and development of small oil fields stepped up its efforts to produce crude oil. The company announced that a 1948 Egyptian law was too restrictive. Under that law 51% of the stock of foreign oil companies must be Egyptian owned. Furthermore, the law provided no guarantee that a company that had done exploration work and located a petroleum field would necessarily be permitted to develop it. U.S. companies retained their distribution facilities in Egypt.

After 30 years of business, a U.S. life insurance company ceased business in Guatemala, except to care for policyholders, because it was unable to meet the requirements of a new insurance law. Mexican interests purchased a U.S. air line in that country in what was described as a multimillion-dollar deal. In Chile proposed legislation sought to finance the nationalization of U.S.-owned electric light and power by special surcharges on power consumers. During 1951 petroleum interests offered to sell 40% of the stock of a Guatemalan distributing company to local investors. Shortly thereafter it was announced that about \$400,000 of shares had been sold to local institutions and small investors.

Investment Guarantees.—In August the U.S. government announced through the Mutual Security agency that U.S. companies were exhibiting a marked increase in interest in foreign investments in countries where they could not be insured by their own government against loss by expropriation or blocked exchange. At the time of the announcement, foreign countries participating in the Mutual Security program had signed formal agreements with the U.S. government in which they would not expropriate capital investments of its nationals, nor would they withhold their earnings by any form of exchange control. Two others had limited their agreements to the field of exchange control only. Shortly thereafter

tual Security agency extended its currency-convertibility guarantee program and its insurance against expropriation losses to investments made in Yugoslavia.

The agency further stated that from the inception of the program in 1948 it had taken in about \$500,000 in premiums from the 40-odd companies that had purchased insurance on nearly \$10,000,000 of investments and that no payments on claims had been made. The insurance coverage was concentrated on currency convertibility, only two companies having taken out insurance against expropriation.

Portfolio and Miscellaneous Investments.—The net investment of \$165,000,000 in foreign dollar bonds and in other securities and indebtedness of foreigners during the first half of 1952 was somewhat below the annual rate for 1951. Purchases of Canadian bonds may have reflected a change in the basic situation prevailing since the fall of 1950 which had favoured the purchase of Canadian securities in the United States. The rise in the Canadian dollar to a premium rate of more than three cents above the United States dollar during the first five months of 1952 made borrowing in the United States less attractive, because the proceeds in Canadian currency for every United States dollar borrowed had declined.

Holders of defaulted bonds issued by other foreign countries were encouraged during the year by German and Japanese steps to restore their credit standing. Representatives of the Japanese government negotiated with British, French and United States bondholders' groups in New York city on Japan's external indebtedness, including dollar bonds of approximately \$1,000,000 of face value and accrued interest of about \$50,000,000 on these bonds which had been in default since shortly after the attack on Pearl Harbor.

Negotiations between representatives of the German government and its creditors were held in London on a considerably larger volume of German government, municipal and corporate bonds in default since the depression of the 1930s. However, a large portion of Germany's dollar debt was no longer held by United States investors, having been repatriated at great losses by investors during the depression. The complicated negotiations were interrupted at one point when the U.S. negotiators walked out of the conference over a disagreement regarding the settlement of the Dawes and Young loans.

Some of the terms of the agreement reached in August for the settlement of the German debts were as follows:

1. In most cases there was no reduction of original principal payments.

2. In the main, future interest rates were somewhat reduced from those provided in the original contracts.

3. Arrears interest was to be reduced, except for obligations to the Reich government which would be funded at contractual rates only to the extent of their accumulation to the end of the year.

4. Amortization of principal of most of the debts would be deferred after five years and maturity dates for most debts were extended.

5. Provision was made for more rapid repayment of capital interest in certain types of debt, if these were to be made in blocked deutschmarks which could be utilized for investment in Germany.

Other developments during the year included sales to the public of shares of investment companies with portfolios of Canadian securities. This development—that of indirectly purchasing a diversified list of foreign securities through a U.S. company—has been watched with interest in investment circles. In June 1952 the remaining \$4,800,000 of a \$50,000,000 loan granted to that country by the International Telephone and Telegraph corporation and used as part payment for the com-

pany's properties sold to the Spanish government in 1945.

Earlier in the year the Foreign Bondholders Protective Council, Inc., announced its approval of the announced terms of a proposed revision of the Peruvian government's debt settlement of five years earlier to which the council had objected. Under the revised terms maximum interest rates were to be raised from 2½% to 3% and back interest scrip amounting to about \$90 per \$1,000 bond was to be paid to present bondholders.

In addition to proposing a settlement of debts as a means of attracting foreign capital, Japan revised the foreign investment law of 1950 during 1952. As amended, the law incorporated a number of changes favourable to foreign investors. These included provision for the full remittance of dividends and interest, the remittance of principal and capital gain from share purchases within six years and a day after an investment was made, the switching of investments, and the protection of for-

DRILLERS preparing the right of way for a railroad being built in 1952 to carry iron ore from Ungava, on the Quebec-Labrador border, to Seven Islands on the St. Lawrence river. The railroad was being jointly financed by steel and mining companies of the U.S. and Canada

Table II.—Estimated Value of Foreign Investments in the United States, Jan. 1, 1952

Type of Investment	(In millions of dollars)							
	Total	O.E.E.C. countries	O.E.E.C. dependencies	Other Europe	Canada	Latin-American republics	All other countries	International institutions

eign investors in new-issue transactions threatening the dilution of their equity. During the year dividend yields were reported at about 15% to 20% of market prices on the Japanese chemical, shipbuilding, metals, machinery and textile shares held by a U.S. investment banking firm.

United States Government.—Long-term loans of the United States government to foreign countries totalled \$331,000,000 in the first half of 1952, the outflow of \$141,000,000 in the first quarter alone equalling the total for all of 1951. The increase reflected larger credit advances to foreign countries under the Mutual Security program of that government than had taken place under the European Recovery program in 1951.

Income from Investments.—Earnings on United States investments in foreign countries approximated \$2,700,000,000 in 1951 the U.S. department of commerce announced in Aug. 1952. Of this sum about \$2,000,000,000 was calculated in the United States balance of payments as income received. A total of \$700,000,000 of foreign subsidiary earnings remained abroad for reinvestment and an unspecified portion of the income received from branches abroad was also returned, as new investments. From indications available early in 1952 receipts from abroad for the year were expected to exceed 1951.

The vast bulk of earnings were accounted for by direct-investment company earnings of about \$2,300,000,000 which reflected the rapid postwar development of production facilities abroad and the great expansion in output that was achieved. Increased rates of return, related to high demands for the products which these facilities were able to satisfy, and the rise in the general price level contributed to the rise in earnings since World War II.

Oil company profits reflected the rapid replacement of Iranian oil by increased production by U.S. companies abroad. Production of crude oil by the major U.S. companies abroad, which had averaged 1,800,000,000 bbl. per day in 1950, rose to an average of 2,400,000,000 bbl. per day for the last half of 1951. The increase in earnings of the companies in that year was reported as directly proportional to the increase in production. One of the companies involved, Standard Oil company (New Jersey), reported that approximately \$320,000,000 or 60% of its consolidated net income in 1951 was earned by subsidiaries operating outside the United States. Several additional foreign countries asked for an increase in their share of profits to a 50% basis during 1952 on oil and mining concessions that had been earlier granted to U.S. firms.

Foreign Investments in the United States.—The value of foreign investments in the United States on Jan. 1, 1952, of \$21,166,000,000, showed little change from a year earlier, rising by about \$100,000,000 during this period in contrast with an increase of \$2,600,000,000 for 1950.

During the first six months of 1952 a noticeable change in value resulted from a rise of \$730,000,000 of foreign short-term claims on the United States.

Short-Term Investments.—During a portion of the first quarter of the year foreigners suffered losses of gold and dollars to the United States, continuing this characteristic of the short-run turbulence of international economic relationships from mid-1951. With a marked increase in U.S. exports during the whole of the first quarter of the year the export surplus of the U.S.

reduced and on balance foreigners increased their short-term claims on the United States by \$168,000,000, although \$557,000,000 of gold to the U.S. treasury. The improvement in international economic relations that became evident in May was reflected in further increases of about \$560,000,000 of foreign banking balances and other short-term assets in the second quarter although the United States acquired somewhat in excess of \$100,000,000 of foreign gold in this period. The gold losses were mainly by Great Britain, the United Kingdom accounting for \$520,000,000 of the \$557,000,000 so that the United States by foreigners in the first quarter of the year.

The rise in banking claims on the United States in the first six months, on the other hand, was shared in by a large number of countries, reflecting the relative strength in their international economic relations at that time. Details available for the first five months of the year showed that of a total increase of \$560,000,000, \$189,000,000 was for Canadian accounts, the United Kingdom accounted for \$114,000,000 of a total of \$139,000,000 for Europe, Venezuelan and Cuban balances each rose about \$67,000,000, and Japan's increase of \$130,000,000 comprised the bulk of the rise of \$214,000,000 for Asia.

The rise in Japanese balances was mainly the result of an agreement by the United States to pay, beginning July 1, approximately half of the expenditures of the U.S. army in Japan in dollars, and of the continued large purchases of goods and services by the armed forces for use in the Korean operations. In connection with Japan's intention to resume settlement on its international obligations (referred to earlier), about \$500,000,000 was set aside for this purpose by the Japanese government with the Federal Reserve Bank of New York. In May the National City Bank of New York granted a \$20,000,000 loan to Spain guaranteed by gold, thereby temporarily, at least, increasing Spanish balances in the United States. During the third quarter of the year the Mutual Security agency gave a \$200,000,000 advance to France with the same effect on French balances.

During the first portion of the year the U.S. treasury department was reported in the press to have blocked the dollar in that country of east Germany, a number of west German enterprises, and two leading Swiss banks in actions aimed at avoiding financial transactions by which the funds were procured to procure materials for Communist China and North Korea from western Europe and South America. The action was denied in Switzerland and high resentment was reported in Swiss stock exchange quarters. In mid-June a decline in the dollar-franc rate in Zurich from 4.33½ Swiss francs to the 4.30½ was reported in the press as attributed largely to anxiety over possible further blocking by the U.S. treasury. The average rate for Swiss francs in New York was 23.138 cents in June, a slight rise for the month.

Long-Term Investments.—Aside from liquidations of \$100,000,000 of U.S. government securities, foreigners engaged

relatively small transactions in long-term investments in the United States during the first half of the year. Both the turnover and net sales of securities were at a reduced volume from the previous six months. On the other hand, several potentially large direct investments were announced.

The chairman of Bowaters Newfoundland Pulp and Paper Mills announced that a \$51,500,000 newsprint and kraft mill would be built in southern Tennessee. The plant would have an initial annual capacity of approximately 130,000 tons of newsprint and 50,000 tons of kraft sulphite and was designed essentially to meet the newsprint shortage in southern states. Courtaulds Ltd., which in 1941 sold the American Viscose corporation to U.S. interests to provide Great Britain with sorely needed dollars, announced that it planned a comeback in the United States. The new company, Courtaulds, Inc., planned to produce 50,000,000 lb. of viscose rayon staple a year.

While U.S. firms were actively developing oil properties in Canada, Canadian firms were purchasing oil lands in the United States. The New Continental Oil Company of Canada, Ltd., was reported to have paid \$6,000,000 for land and 35 producing oil wells in Texas. Other Canadian interests were engaged in transactions in the United States section of the Williston basin, mainly in Montana. Canadian interests were also reported ready to acquire prospective oil lands in northern Wyoming.

In July the British firm of Ferranti Electric Ltd., through its U.S. subsidiary of the same name, won a U.S. army award for power transformers for a dam in North Dakota with a bid totalling more than \$1,100,000. Under the Buy America act, foreign bids may be accepted automatically if they are more than 25% below the lowest U.S. bid.

Income from Investments.—Total foreign earnings on investments in the United States were about \$540,000,000 in 1951 while income payments to foreigners were just under \$400,000,000, the difference being undistributed earnings of direct-investment subsidiaries. While only meagre data were available for 1952, it appeared that income payments would be higher than in 1951. Forests. **United States.**—In the report of the President's Materials Policy commission (*q.v.*), issued in June 1952, forest products were grouped among important production materials that are scarce in relation to their potential use. Total consumption of forest products in the United States had declined during the half century since 1900, although the population doubled during this period and the consumption of minerals increased sixfold. One of the reasons for decreased use of lumber, the report said, had been dwindling domestic supplies. Most of the country's virgin timber had been felled. New growth on the cutover areas was running behind the annual output of saw timber. The consequent higher costs, reflecting both market scarcity and costs of replacement, had edged timber out of uses to which it was well adapted, and exhaustible materials had taken the place of renewable timber because they were cheaper.

"The extent to which new growth of timber can be brought to balance with consumption will depend importantly on how

well forest land is managed and how efficiently its products are used," said the commission's report. "There is still plenty of land for trees to grow on. About 460 million acres—roughly one-quarter of continental United States—are suitable and available for producing commercially valuable crops of timber. . . . Only in the last 50 years has the United States begun to treat forests as renewable. Annual growth of saw timber still is less than half enough to meet current requirements and future demand on a sustained-yield basis."

The President's Materials Policy commission, headed by William S. Paley, was appointed by Pres. Harry S. Truman to study the long-range materials problem of the United States and its relation to future needs. Its recommendations with respect to forest resources called for increased attention by the federal government, in co-operation with the states, to reforestation and to the protection of forest lands from fire, insects and diseases. Also recommended were an expansion of technical assistance to small-scale woodland owners and timber processors, and a national system of forest credit and forest insurance. Construction of access roads was recommended to open up federally owned commercial timber lands in the western states. The report called upon the federal government to assist the states in establishing systems of compulsory regulation to prevent destructive timber cutting and said that if, after a period of years, serious gaps remained in state systems of regulation, the federal government should establish minimum cutting regulations. To relieve tax pressure toward premature cutting, it recommended that the states substitute yield taxes for ad valorem taxes on timber.

A serious epidemic of Engelmann spruce beetle was reported in the northern Rocky mountains in the summer of 1952. The insect outbreak was the result of violent windstorms in 1949 which damaged great numbers of trees and provided favourable conditions for development of the beetles. Logging operations were accelerated to salvage as much of the infested timber as possible. In Colorado, a control program started in 1950 against an epidemic of the same species of insect appeared to have been successful. Beetle infestations in 1952 were greatly reduced. Control operations against an outbreak of southern pine beetle in Mississippi were started during the year.

Richard E. McArdle became chief of the United States forest service July 1, 1952. He succeeded Lyle F. Watts, who retired after nearly 40 years of governmental forestry service, including 9 years as U.S. chief forester. (C. E. R.)

Canada.—During 1952 the woodlands section of the Canadian Pulp and Paper association announced it would "engage on a major effort to grow more and better trees" to expand wood fibre supplies. The federal government's eastern Rocky mountain conservation project, covering 8,618.74 sq.mi. in Alberta, was improved by increasing the money available annually for maintenance and by extending the time of the \$6,300,000 capital expenditure program, which by 1952 saw the completion of 16 forest fire lookout towers equipped with short-wave radio and a fair start at building suitable access roads. The federal government signed an agreement with British Columbia for co-operation in reforestation and for a forest inventory, and an agreement with Prince Edward Island for reforestation.

New Brunswick suffered a serious infestation of spruce budworm, and a special aerial spray project covered 300 sq.mi. in June. By September surveys indicated that between 4,000 and 5,000 sq.mi. in addition were affected, and four major pulp and paper companies joined forces to form the Forest Protection company to combat the threat; five airfields were constructed and 1,560 sq.mi. were scheduled for spraying in 1953. Pulp and paper companies in Quebec planted 811,539 trees in reforestation projects. Ontario's forest inventory, begun in 1946,

neared completion, and the government announced a program of sustained yield beginning with crown lands forests; a new policy involved a charge of 1.4 cents each for Scotch pine and 1 cent each for other nursery seedlings, which had formerly been free. The provincial forestry branch of Saskatchewan planted 255,000 trees, mostly in the Fort à la Corne forest; a forestry survey revealed that the province might have approximately 30,000,000 cords of standing softwood suitable for pulping in its north-eastern parts.

(C. Cy.)

Great Britain.—The Forestry act, 1951, which came into force in Oct. 1951, prohibited the felling of any growing tree over a given diameter without a licence and brought about a fundamental change in British forestry by giving the commissioners powers to attach replanting conditions to a felling licence. The commissioners were also empowered to require an owner to thin a neglected plantation or to fell blocks of trees which were deteriorating.

For the year ending Sept. 30, 1952, the maximum amount of timber licensed for felling was 26,000,000 cu.ft. broadleaved and 7,100,000 cu.ft. conifers. In spite of increased government grants for planting and maintenance, the total acreages planted by private owners and by the state were estimated to be only about half the allotted program for 1952. Labour shortages and the difficulties in acquiring sufficient plantable land were stated to be the chief obstacles to adequate state planting. Experiments with selective weed killers were carried out in research centres, particularly in the suppression of fast-growing weeds in forest nurseries and young plantations.

Commonwealth.—The British Commonwealth Forestry conference was held at Ottawa, Ont., in Sept. 1952 and was attended by leading representatives from Great Britain and all parts of the commonwealth. The agenda covered all aspects of forestry, including policy, silviculture, management, protection, utilization and research activities. The delegates crossed Canada to the Pacific coast, visiting maritime, prairie and mountain forests en route.

New Zealand was faced with the problem of the extraction and utilization of the thinnings from extensive areas of young coniferous plantations, particularly *Pinus radiata*. An important project known as the Murupara scheme was launched for an integrated sawmilling, timber pulp and newsprint industry to be established in the vicinity of the Kaingaroa State forest. It was expected that the project would require about 23,000,000 cu.ft. of logs a year and that the logging problems involved would require new methods of exploitation; mechanical cableways were being considered. The National State survey of New Zealand's indigenous forest resources was extended during 1952, and sustained yield management was introduced for certain indigenous forests, notably those of *Nothofagus*.

An inter-African forestry conference was convened, by the Commission for Technical Co-operation in Africa, at Abidjan on the Ivory Coast and attended by delegates from all African forestry departments.

In Tanganyika the government directed that an additional 17,500 sq.mi. of forest should be reserved by 1960, and a considerable increase in the forestry staff was sanctioned to hasten the survey of the very large areas of still unchartered forests.

In Gambia the reservation of forests was started with the demarcation of 25 forest parks, averaging 1,000 ac. each, but the legislative council rejected the usual designation of "forest reserves" for these areas.

In Northern Rhodesia, where protection against forest destruction and degradation of the soil was one of the greatest problems of the forest department, a new forest policy was formulated in which one of the essential operations was to be the early burning, under control, of the grass and forest litter

to prevent the more serious fires and damage that occur when the annual burning is delayed until late in the dry season.

In British East Africa, particularly in Kenya and Tanganyika, the planting of exotic conifers was continued as the most economic means of growing the maximum volume of marketable timber on a given area.

In British West Africa, particularly in Nigeria, the use of mechanical equipment increased the extraction and conversion of timber, and the sawmills and plywood factories reached a high standard.

In Sarawak measures were taken under the Forest Ordinance to increase the control of forest areas by formation of permanent forest reserves. It was estimated that shifting cultivation was destroying the forests at the rate of about 100 sq.mi. a year.

In Fiji systematic forest management started, 76 sq.mi. of mangrove forests being controlled on a regular rotation for firewood production, but the forest reserves were still limited.

In British Guiana, detailed topographical surveys and timber enumerations in the large forests of the Crown corporation concessions were completed, and systematic fellings could be carried out under silvicultural control.

An experimental attempt was made to extract crabwood from above the Camaria falls on the Cuyuni river, but losses were heavy and only 490 logs were delivered to the mills from 100 floated through the falls, so the operation was suspended. It was considered that about 14,000 sq.mi. of forest in the interior of the colony could be considered economically accessible and would be sufficient to provide for the needs of the timber industry for 25 years.

Local forest resources in Ceylon were developed by modern methods through the assistance of the Food and Agriculture Organization of the United Nations (F.A.O.). Plans were made to open up large previously inaccessible forests in order to produce the large quantities of timber still being imported to meet the country's needs.

Similar developments were taking place in the Chittagong hills in East Pakistan.

In Cyprus a new £50,000 forestry college at Prodomos was opened for Cypriot and Arab forestry students. This college would serve the needs of the whole middle east area.

Although many members of the forestry staff in Malaya were still engaged on full-time emergency duties, steady progress was made. The Forestry Research institute continued its work under considerable difficulties, and the forestry school was enlarged to include students from Borneo.

In North Borneo the monopoly held by a timber company since 1920 was terminated, but new concessions were granted with special safeguards for systematic work and forest conservation.

Europe.—The F.A.O. again gave technical and financial assistance in forestry, particularly in Austria and Yugoslavia. The Austrian government was given help in reafforestation and the construction of forest access roads and cableways for logging.

Forest experts were sent to Yugoslavia to advise on modernizing of timber extraction and processing methods and also to install a forest products research laboratory at Zagreb. (See also LUMBER.)

Formosa. (TAIWAN). Formosa is a large island in the western Pacific, separated from China to the west by the Straits of Formosa and from the Philippines to the east by the Bashi and Balintang channels. Area 13,906 sq.mi.

cluding the Pescadores and 75 neighbouring islands. Population (est. 1951) 10,000,000, including Chinese nationalist troops and fugees from the mainland.

The capital is Taipei (or Taipeh, formerly Taihoku) (pop. 1,077,777 in May 1950); other municipalities are Kaohsiung (formerly Takao) (275,563); Tainan (229,452); Tai-chung (formerly Taichu) (207,009); and Chilung (or Keelung, formerly Irun) (145,240).

The principal religions are Buddhism, Confucianism and Taoism. Governor in 1952 was K. C. Wu.

History.—Formosa, the only territory remaining in the control of the Chinese nationalist government after the successful advances of the Chinese Communists on the mainland, was converted into a nationalist military stronghold in 1949 and 1950. To assist the nationalist government in the defense of Formosa, the United States established the U.S. military assistance advisory group on May 1, 1951, under the command of Maj. Gen. William C. Chase. It was reported in March 1952 that the United States planned to double the size of its military assistance group from the 360 officers and men then on Formosa in order to speed the training of 500,000 Chinese troops for defense of the island. The possibility of these troops participating with United Nations forces in the Korean conflict was voiced from time to time during the year, but training for the defense of Formosa remained the objective of the U.S. military assistance program.

Education.—In 1949 there were 1,199 primary schools with 900,648 pupils; 206 intermediate schools (middle, normal and vocational) with 114,616 students; and 6 higher schools (1 university and 5 colleges) with 5,905 students. The literacy rate in 1951 was estimated to be 60%.

Finance.—The currency is the new Taiwan dollar, issued in June 1949. A dual exchange-rate system was instituted on April 10, 1951, providing a foreign exchange certificate rate and an official exchange of NT 1.65 and NT \$10.30 respectively to U.S. \$1.00. Certain transactions on the government account, as well as certain specified private transactions, were accorded preferential treatment. On April 30, 1952, the total note issue was about NT \$565,000,000. Total revenue of the central, provincial and local governments in 1952 was estimated at NT \$2,428,000,000. Expenditures were NT \$2,715,000,000. Total bank deposits at the end of May 1952 were NT \$1,429,000,000.

Trade.—Formosa had a favourable trade balance in 1951 including U.S. aid, with exports totalling U.S. \$98,200,000 and imports U.S. \$50,500,000. In the first six months of 1952, Formosa had total exports U.S. \$69,400,000 and imports of U.S. \$59,000,000. The chief export in 1951 were sugar, 283,500 metric tons valued at U.S. \$56,400,000, and rice, 84,900 metric tons valued at U.S. \$13,000,000. Japan was the major destination of Formosa's exports and the major source of its imports in 1951. Authorizations by E.C.A. (later M.S.A.) for assistance to Formosa in 1951 totalled U.S. \$113,000,000. In the first five months of 1952, these authorizations totalled U.S. \$25,000,000 and the initial authorization for the fiscal year beginning July 1, 1952, totalled U.S. \$50,000,000.

Transportation and Communications.—In 1951 there were about 925 mi. of government railroads, as well as about 1,625 mi. of sugar plantation roads, 250 mi. of forestry railroads and 250 mi. of push-car lines serving various agricultural areas. Average daily freight hauls were 100 metric tons and the average daily passenger load was 201,000 during the first eight months of 1951. There were about 16,380 mi. of roads, including 3,380 mi. of main highways. As of mid-1951 there were more than 18,000 telephone subscribers on the island.

Agriculture.—Agricultural production in the 1951-52 crop year in metric tons amounted to: rice (brown) 1,480,000; raw sugar 553,400; pineapples 42,200; bananas 102,300; citrus fruits 27,500; coconuts 7,800; jute 10,000; sisal 3,000; ramie 1,000; sweet potatoes 2,500; peanuts 60,000; wheat 20,000; barley 2,200; corn 3,000; millet 5,000; cassava 120,000; beans and peas 11,000; and fish 77,000. The developed area in 1952 was estimated at 3,180,000 ac., of which 80,000 ac. were privately owned. Of the latter, 2,060,000 ac. were under cultivation.

Industry.—Estimated industrial production in 1951, in metric tons, amounted to: coal 1,657,000; black iron sheet 1,215; cement 389,000; paper and pulp 28,000; chemical fertilizers 110,000; aluminum 5,543; cotton 284,000; cotton yarn 7,179; and cotton cloth 56,643,000 yd. In the first six months of 1952 industrial production, in metric tons, amounted to: black iron sheet 876; cement 203,000; paper and pulp 12,500; chemical fertilizers 58,200; salt 247,000; gasoline 43,000 kl.; diesel oil 100 kl.; fuel oil 70,000 kl.; copper (electrolytic) 344; caustic soda 26; chlorine 871; and hydrochloric acid 1,330. In the first six months of 1952, 654,000,000 kw.hr. of electric power were generated.

Four-H Clubs. Membership of boys and girls in the 4-H clubs of the United States reached 2,004,139, its highest figure, in 1952. Each boy or girl who joins a 4-H club undertakes a project, that is, some farming or home-making activity to be carried out according to the latest scientific methods at a member's home under the guidance of the county extension agents and the voluntary local leaders trained by the agents. In 1952 the members completed an average of about one and one-half projects per member. More than 78% of all projects undertaken during the year were completed. Completion of a project includes doing the actual work involved in growing the crop or animal, in performing the home-making tasks or whatever the project comprises, supplemented by keeping records of labour and cost, making an exhibit of the things produced in the project work and writing an account of what was done.

During the year more than 292,000 adults served as voluntary leaders, a considerable number of them former 4-H club members themselves. County extension agents held 61,072 training meetings, helping to prepare these leaders for their work.

The age limits for 4-H club members are usually from 10 to 21 years, with some variation in different states. As in previous years, the highest enrolment by age was in the 10- to 14-year groups. Membership in the 4-H clubs is voluntary.

Interest of other countries in the methods followed in the conduct of 4-H club work in the United States continued. Co-operative extension workers and 4-H members in a number of states were visited by representatives of rural youth organizations in other countries who spent from three to six months studying methods in various parts of the United States. A number of co-operative extension service employees spent some time in other countries, on their invitation, to discuss rural youth extension work.

The 4-H club work is a part of the educational program in agriculture and home economics of the co-operative extension service in which the U.S. department of agriculture, the state agricultural colleges and the county governments participate.

(M. L. W.)

Fowler, Henry H. (1908-), U.S. government official, was born on Sept. 5 at Roanoke, Va. He took his B.A. degree at Roanoke college in 1929 and his LL.B. at Yale university school of law in 1932; the next year he received his J.S.D. at Yale. He was admitted to the Virginia bar in 1933 and from 1934 to 1938 was an attorney for the Tennessee Valley authority. In 1939 he became assistant general counsel of the TVA and special assistant to the U.S. attorney general. In 1941 he was appointed assistant general counsel of the Office of Production Management, and from 1942 to 1944 he held a similar office with the War Production board. Later in 1944 he was appointed a staff member of the Foreign Economic administration, with the special task of estimating the remaining military and economic capabilities of Germany. Fowler returned to private law practice in 1946, at Washington, D.C. In Sept. 1951 Pres. Harry S. Truman appointed him deputy administrator and in Jan. 1952 head of the National Production authority, and on May 7, 1952, Fowler was appointed administrator of the Defense Production administration, effective June 1. On Sept. 5, 1952, President Truman named Fowler to the principal U.S. mobilization office, director of defense mobilization, to succeed John R. Steelman, acting director.

France. A republic of western Europe, France is bounded north by the English channel, northeast by Belgium and Luxembourg, east by Germany and Switzerland, southeast by Italy, south by the Mediterranean sea, southwest by Spain

and west by the Atlantic ocean. Area: 213,010 sq.mi., including the Mediterranean island of Corsica (3,367 sq.mi.) and small Alpine territories ceded by Italy in 1947 (273 sq.mi.). Pop.: (1946 census) 39,829,838; (mid-1952 est.) 42,239,000. Language: French is almost universally spoken but there are also other regional languages or dialects: German in Alsace and part of Lorraine; Breton in Brittany; Flemish in the northern corner of the Nord *département*; Provençal in the Alpes Maritimes, Basses-Alpes, Var and Bouches-du-Rhône *départements*; Catalan in Roussillon (Pyrénées-Orientales); Basque south of Bayonne; and Italian in Corsica. Religion: mainly Roman Catholic with c. 1,000,000 Protestants and more than 230,000 Jews. Chief towns (pop., 1946 census): Paris (cap.; 2,725,374); Marseilles (636,264); Lyons (460,748); Toulouse (264,411); Bordeaux (253,751); Nice (211,165); Nantes (200,265). President of the republic, Vincent Auriol; premiers in 1952, René Plevén, Edgar Faure and (to Dec. 23) Antoine Pinay (*q.v.*).

History.—During 1952 France had three premiers. René Plevén (Union Démocratique et Socialiste de la Résistance), who had come into office on Aug. 8, 1951, resigned on Jan. 7; Edgar Faure (Radical) was elected on Jan. 18 and resigned on Feb. 29; Antoine Pinay (independent) was elected on March 6. Neither Faure nor Pinay had been premier before.

Robert Schuman (M.R.P. or Mouvement Républicain Populaire) was foreign minister and Charles Brune (Radical) minister of the interior in all three governments. René Mayer was minister of finance in the Plevén government; in the two subsequent governments the premier himself took this portfolio. Georges Bidault was minister of national defense under Plevén and Faure, Plevén under Pinay.

Throughout 1952, successive governments were trying to become masters of the inflationist trends released by the Korean war. These were given fuller scope in France than in most countries, partly because confidence in stability had been undermined by 35 years of progressive inflation and partly because 1951 was an election year. The cost of living index for Paris had reached 144.8 in Feb. 1952, little more than two years after the new basis of 100 had been adopted at the end of 1949. In consequence it was not surprising that the balance of

payments deficit, which had shrunk to the equivalent of \$ 000,000 in 1950, had expanded again in 1951 to \$1,058,000. To support the Pinay government's effort at stabilization nearly a quarter of the deputies of Gen. Charles de Gaulle's Rassemblement du Peuple Français (R.P.F.) broke away from their leader, thereby widening the basis of the parliamentary regime and permitting the Socialists to go into opposition without incurring the odium of making it impossible to govern. Although Pinay stood farther to the right than any previous prime minister of the fourth republic he enjoyed widespread popularity for his attempt to base policy on the defense of the consumer, whether employer or employee.

The year was unusually free from industrial strikes. Communist attempt to launch political protest strikes totally unsuccessful and showed that the party's electoral strength could not easily be transposed onto other planes.

Plevén Cabinet.—The ratification of the European Coal and Steel Community on Dec. 13, 1951, by 377 to 233 votes the new national assembly its first occasion to show that though it had so far proved an inadequate instrument of government, it had fine debating qualities. The Gaullist speaker criticized the treaty on the ground that for a united Europe was an inadequate starting point, which should have been political federation. This was an argument that was to provide common ground for Gaullists and Socialists when the European Defense Community was first discussed in February. The Gaullist attitude to the Coal and Steel Community was, however, one of caution, not opposition. They insisted on the necessity of continued investment to enable the French heavy industry to compete with the German, and on the importance of making the Moselle navigable so as to give the Lorraine-Saar industrial complex a waterway to the sea. These recommendations were incorporated in the law authorizing ratification.

The government's main political preoccupation as 1951 drew to the end was the budget. Indeed it was hope of consolidating a majority to pass it that led the government to postpone disastrous consequences further discussion of reforms with the Tunisian government, since these plans were causing alarm among deputies concerned with the interests of the North African settler community. This concession to the latter proved no avail, since the Plevén government was at all events defeated by 341 to 243 on Jan. 7 over its measures for balancing the budget. The elements of the budget as proposed were as follows: Expenditure: civilian administration and service on debts 1,000,000,000 fr., state equipment 170,000,000,000 fr., economic modernization and equipment 395,000,000,000 fr., reconstruction 400,000,000,000 fr., defense expenditure 950,000,000,000 fr., special accounts 85,000,000,000 fr.; total 3,365,000,000,000 fr. Revenue: existing taxes 2,665,000,000,000 fr., increased charges for gasoline and tobacco 70,000,000,000 fr., U.S. 70,000,000,000 fr., new taxes 160,000,000,000 fr.; total 2,905,000,000,000 fr. Deficit 400,000,000,000 fr.

The new taxes were to be provided by a 10% increase in most forms of income tax as well as of some indirect taxes. The government was also asking for powers to reorganize the railways and social security so as to diminish the deficits that were a serious drain on the treasury. These proposed powers, though carefully circumscribed, brought the Socialists into opposition. (See also EUROPEAN UNION.)

Faure Cabinet.—It was expected to be long before anyone would win the necessary 314 votes to be elected premier after only 11 days Edgar Faure, the youngest premier since either the third or fourth republic had known (aged 43), was elected by 401 votes to 101 with the Gaullists abstaining and the Socialists voting for him though they refused to enter a cabinet which was almost identical with his predecessor's.

"NOT UNUSUAL, GENERAL . . . IT HAPPENS TO OLD SOLDIERS," a 1952 cartoon by Fischetti of the NEA Service, Inc.

FRENCH FAMILY in the doomed Alpine village of Tignes discussing their problems with a visitor before all residents were forced to evacuate in March 1922. Because of a new power dam, the village later disappeared beneath a lake formed by the dammed waters of the Isère river. (Note the cows being sheltered in the family living room)

program speech he carefully limited himself to immediate problems so as to avoid raising unnecessary occasions of differences in his coalition ranging from Socialist to Conservative. He showed himself a remarkable debater and threw himself with great courage into the three principal problems—pacification of Eastern Europe, obtaining some kind of mandate from the assembly for the negotiations with a view to creating the European Defense Community and representing France at the North Atlantic Treaty organization (NATO) Lisbon conference, and finally the budget and associated economic problems. In the second he was not very successful, but the third was to bring him down before he could show what he could do in the first. The urgency of the economic problems was shown almost at once by the reintroduction of import quotas on a big scale so as to prevent a ruinous loss of gold and dollars. An attempt to pilot a prudent form of automatic wage sliding scale bill through the assembly—to replace that voted by Communists, Socialists and Gaullists, which Faure's predecessor had had to let past him into the Chamber house in the hope of taming it on its return—broke down, so that Faure too had to hope that it could be put right at a later stage.

The three days allotted for a debate on the European Defense

Community spun themselves out to nine, but here at least a resolution was at last agreed upon that gave the French government the possibility of action at Lisbon. Fears and suspicions aroused by the scheme as worked out by the experts were expressed from almost all parts of the house, and from almost as many parts it was declared that if only the United Kingdom had joined the fears would not exist. The national units were found disquietingly big, offering, it was argued, encouragement and facilities to German irredentism, which, it was also argued, was the gravest danger to peace between east and west. The resolution, finally passed by 327 votes to 287, authorized the government to go ahead provided the German contingent in the European army was never larger than the French, that no recruitment should start in Germany before ratification, that the sole purpose of the European army should be to protect its members' existing territory, that the European army should only be progressively established in so far as organizations to command and direct it had been created. It was recalled that no state could join NATO without the agreement of all its members. The government was asked to obtain an Anglo-U.S. guarantee against the secession of any member of the European Defense Community.

When Faure finally left for Lisbon on Feb. 19, almost his last words were a warning that the delay in getting the budget balanced would mean additional burdens. It was further stated at the ministry of national defense that rising costs would

"SAVE THE FRANC" placard, of the kind displayed by most Parisian shops in 1952, implying to patrons that goods were marked down in support of the government's plea to halt inflation by lowering prices

increase the defense bill from 950,000,000,000 fr. to 1,200,000,000,000 fr. The new proposals laid before the assembly on Feb. 25 were a 15% instead of a 10% increase in taxes, and cuts of 8% in re-equipment and 3% in reconstruction credits. Faure reminded the assembly that a deficit was piling up at the rate of 1,000,000,000 fr. a day, that the treasury would soon have difficulty in meeting its obligations, that the country was faced with an increasingly grave deficit in its foreign balance of payments. On Feb. 29 the first article in the bill (*i.e.*, the increase of taxes) was rejected by 309 votes to 283. More than half of Faure's own party had abandoned him. After resignation, while still in charge of current affairs, he had to ask the assembly to authorize a loan from the Bank of France of 25,000,000,000 fr. for three weeks so that the French treasury should not stop payments.

Pinay Cabinet.—Antoine Pinay, Faure's successor, was equally unexpected in the premier's office. His election by 324 votes to 206 was caused by the revolt of 27 Gaullist deputies (instead of the expected dozen) against their party's decision to abstain. Pinay, aged 60, was a late comer to the forefront of national politics. In his declaration of policy he accepted the assembly's repeated rejection of additional taxes as final and adopted as principle that expenditure that was long-term investment (*e.g.*, re-equipment and reconstruction) ought to be financed from loans. Uncovered expenditure must be cut. Past offenses whether fiscal or political should be covered by amnesty and tax collection in future made much more strict, with the help of a simplified tax code. Prices must be rigorously held down. There was much in this to attract the more conservative followers of De Gaulle, who were at all events very dissatisfied with a policy that was so negative as to seem to court national disaster.

Many of those who had voted for Pinay had not expected him to obtain a majority. The M.R.P. members were concerned to find themselves linked to a premier so far to the right. Not all Pinay's own party colleagues were pleased at his success. The Gaullist rebels were uncertain for how long and how far they wished to rebel. The latter declined offers of portfolios, and the M.R.P. came in only on condition that foreign policy remained in the hands of Schuman, whom Pinay had shown

some inclination to replace.

In several respects the situation was more favourable Pinay than to his predecessors. The leanest period of the from the treasury's point of view was past. World prices of materials were falling. His predecessor had slashed imports initiated negotiations for \$100,000,000 credit with the European Payments union (E.P.U.) which forestalled the necessity of paying large sums in gold or dollars to settle foreign trade negotiations. This gave Pinay a good foothold for his anti-inflationist fight, which he pursued logically although the assembly was only a little less unwilling to cut expenditure than it had been to vote new taxes. He passed his amended budget through the assembly on April 13 with 200,000,000,000 fr. of currency credits blocked until covered by loans. This still left 400,000,000,000 fr. to be found by loan. The government stopped the rise in the cost of living, which fell from 14.1 in February to 14.2.8 in June.

Pinay finally secured the passage of an automatic scale bill in a form which gave a good deal of satisfaction in principle to its backers but which so fixed the starting point of calculation that the index figure would have to reach 144.8 before the basic minimum wage was increased. The 3.5% free loan with the gold value of the capital guaranteed could be described as a failure, for a total of 195,000,000,000 fr. of new money had been subscribed when it was closed on July 1. But it was also no triumph and indicated that a great many Frenchmen were quite unprepared to lend their savings in support of the government whose policy they approved. This was notably true of the peasants. Pinay risked their opposition by refusing their demand for an increase in the price of wheat over that of 1951, but offered some compensation by reduction of the prices of industrial products needed by the farmer. The reform of the tax system promised for June had to be postponed till October. In early July Pinay's initial success in uniting the Gaullist forces was confirmed by the resignation of deputies from the R.P.F. when the party leaders tried to enforce voting discipline. On July 13 he had the triumph of getting the parliament go on holiday till October; *i.e.*, on a traditionally appropriate date, which had been unobserved for many years.

The summer holidays were not altogether favourable to the Pinay government, for by the end of August the cost of the index figure had risen again to 144.8, partly as a result of drought and foot-and-mouth disease. On Aug. 30 Pinay took action against price rings and declared that stabilization should provide new capital for housing. Early in September recognizing the limits of a merely persuasive approach, he imposed a ceiling on the prices at the level obtaining on Aug. 31. This was not particularly successful in forcing down food prices. Industrial prices continued slowly to fall and at the end of the month the government felt reasonably safe against a further inflationary burst before the end of the year. It also proposed to help the big low-cost shops rather than the small high-price ones. The 1953 budget was prepared on the principle that the expenditure of no civilian ministry might be increased, but that of the ministry of education, which was faced with the problem of housing a steadily increasing school population, but this proved very difficult to apply.

The refusal of the U.S. government at the end of July to make any guarantee of offshore purchases beyond the current year, and also to include in these purchases some lines of primary manufacture to which the French government attached great importance, was a blow to the government both militarily and financially. But the government decided to maintain its arms program and an increase in defense costs became inevitable.

The Communist Rivalries.—The Communist party, in the

nance of Maurice Thorez, still an invalid in the U.S.S.R. after a stroke of Oct. 1950, suffered a series of defeats beginning with an unsuccessful protest strike called on Feb. 12, because of an additional demonstration commemorating left-wing counter-revolution in Feb. 1934 had been banned. None the less it was decided to hold on May 28 a large-scale demonstration against the presence in Paris of Gen. Matthew B. Ridgway. There was no sign of mass participation, but small groups of disciplined Communists attacked the police with great violence. After the rioting had subsided Jacques Duclos was arrested in his car near the area where it had occurred. He was held on the ground that he had been caught "red-handed" (in the perpetration of violence), the only condition on which a deputy can be either arrested or prosecuted without the assembly's permission. On July 1, however, a court decided that the police had failed to prove that Duclos had been caught in the act so that he had to be released and the case dropped. Meanwhile proceedings against other Communists were prepared with a view to a trial or trials for conspiracy to be held in the autumn. In spite of the blow to the government's prestige when it failed to make its case against Duclos, that to the Communist party's prestige for failing to back its incessant propaganda with mass action was much more serious. The meetings of the party central committee on June 18 and Sept. 3 and 4 were filled with confessions of error which *L'Humanité* made public. The party had failed to associate the mass of non-Communists with its disciplined spearhead. A fortnight later, André Marty and Charles Tillon, both advocates of the unsuccessful demonstration, were demoted, the first from the party secretariat, the other from the Politburo.

The imminent return of Maurice Thorez, whom Marty had proposed within the party, was announced by Duclos at the meeting of Sept. 3, but *L'Humanité* added that the secretary-general of the party would still have to limit his activities because of the state of his health.

Robert Schuman imperturbably continued his European policy. He obtained Italian support for his two proposals: one that the assembly of the European Coal and Steel Community which met in September should discuss the creation of a supranational European political executive; the other, put forward on July 23, that the Saar territory should be Europeanized and Saarbrücken made the seat of such European institutions as the executives of the Coal and Steel and the Defense Communities (see SAAR). The first proposal was important from the point of view of securing a majority in the assembly for the ratification of the European Defense Community treaty, which, it was argued by its critics, presupposed a political authority.

(D. R. GL.)

Education.—(1950–51) Elementary schools: state infant 3,788, pupils 15,574; private infant 198, pupils 18,289; state elementary 69,970, pupils 3,831,938; private elementary 10,982, pupils 894,474; state higher elementary, pupils 206,180; private higher elementary, pupils 59,914; total elementary 84,938, pupils 5,498,369. Secondary schools: state 983, pupils 459,921; private, pupils 334,248; total pupils 794,169. Lower technical and vocational schools numbered more than 220. Higher education: state universities 17, students 139,533, including 38,732 in the law faculties. There were no other state institutions of higher education, 6 (Catholic) universities and more than 80 state and private institutions of higher technical education.

Finance.—Budget: (1951 actual) revenue 2,346,000,000,000 fr., expenditure 2,849,000,000,000 fr.; (1952 est.) revenue 2,773,000,000,000 fr., expenditure 3,498,000,000,000 fr.; (1953 est.) revenue 3,350,000,000,000 fr., expenditure 4,000,000,000,000 fr. National income (1951) 9,020,000,000,000 fr. Public debt (Jan. 1, 1952) external 1,254,400,000,000 fr. Currency circulation (Oct. 1, 1952) 2,041,000,000,000 fr. Deposit money (July 31, 1952) 1,932,000,000,000 fr. Official exchange rate (1952) 350 francs = U.S. \$1.

Foreign Trade.—Imports in 1951, including the Saar, were valued at 99,000,000,000 fr., compared with 1,072,728,000,000 fr. in 1950; exports amounted to 1,480,000,000,000 fr. in 1951, compared with 1,072,000,000,000 fr. in 1950. The main sources of imports (1951) were: French Union 21%; U.S. 11%; German Federal Republic 6%; Australia 1%; Belgium-Luxembourg 5%; U.K. 4%. The main destinations of exports were: French Union 37%; U.K. 9%; Belgium-Luxembourg 6%; Switzerland 6%; U.S. 6%; German Federal Republic 5%.

Transport and Communications.—Railways (1950): 41,272 km. including 4,077 electrified. Railway traffic (monthly average, 1951): passenger-kilometres 2,323,000,000; freight ton-kilometres 3,783,000,000; freight transported 14,700,000 metric tons. Roads (1950): 715,696 km. including 80,231 km. of first-class national roads. Motor vehicles licensed (Jan. 1950): 2,295,000 including 572,800 commercial. Navigable inland waterways (1948): 8,488 km.; cargo (monthly average, metric tons, 1951): loaded 3,358,000, unloaded 3,291,000. Shipping (Jan. 1952): merchant vessels 726, gross tonnage 3,173,224; cargo in external trade (monthly average, metric tons, 1951): loaded 1,884,000, unloaded, 3,411,000. Civil aviation traffic, Air France only (monthly average, 1951): passenger-kilometres 105,200,000; cargo ton-kilometres 3,300,000. Telephones (1951): 2,405,802. Radio receiving set licences (1947): 5,728,000.

Agriculture.—Main crops (metric tons, 1951 except as indicated): wheat 7,065,000; rye 504,000; barley (1952) 1,713,000; oats (1952) 3,257,000; maize (1952) 612,000; potatoes 13,459,000. Livestock (Sept. 1951): cattle 15,801,000; pigs 6,824,000; sheep 7,510,000; goats (Sept. 1950) 1,283,000; horses 2,397,000. Foodstuff production (metric tons): meat (1951) 1,800,000; milk (1950) 15,000,000; butter (1950) 250,000; cheese (1948) 190,000; sugar, raw value (1951) 1,266,000. Wine production in 1951 was 47,329,000 hl., compared with 61,334,000 hl. in 1950. In 1951, 11,000,000 hl. of wine were imported, mainly from Algeria; 632,000 hl. were exported, mainly champagnes, clarets and Burgundies.

Industry and Production.—Industrial production (metric tons, 1951, excluding the Saar): coal 52,956,000; iron ore (35% metal content) 33,600,000; pig iron 8,748,000; steel ingots and castings 9,828,000; cement 8,352,000; woven cotton fabrics 163,200; cotton yarn 271,200; wool yarn 120,000; rayon filament yarn 57,100; rayon staple fibre 49,600; gas 2,436,000,000 cu.m.; electricity 36,115,000,000 kw.hr. There were 313,900 motor cars and 131,400 trucks produced in 1951. There were 68,050 dwelling units built in 1950, including 30,120 repaired. The mid-1951 index of employment stood at 117, and the mid-1951 index of industrial production was 131 (1937=100).

Franco, Francisco (1892–), Spanish army officer and statesman, was born at El Ferrol, Galicia, Dec. 4. He graduated from the military academy of Toledo in 1910. (For his early career, see *Encyclopædia Britannica*.) On the outbreak of civil war in July 1936 he became leader of the rebels. After a bitter three-year struggle, he emerged as the *caudillo* and *generalísimo* of Spain. During World War II, though his sympathies were pro-German and antisoviet, he remained neutral. On June 7, 1947, the *cortes* passed unanimously the Succession act, making Spain a nominal kingdom, confirming Franco in office as chief of the state for life and according him the right to nominate his successor.

On Jan. 31, 1952, the khalifa of Morocco reported favourably on talks with General Franco in Spain. In April Franco sent a diplomatic mission through the Moslem countries of the middle east, with a broadcast speech in which he praised their national resurgence which he compared with the "decrepitude" of other western European countries. He also made a bid for Moorish favour by implying that he was eager for Moroccan independence. In June he addressed pilgrims at the 35th Eucharistic congress at Barcelona.

French Equatorial Africa. This federation in central Africa of four overseas territories of the French union is bounded west by the Atlantic ocean, Nigeria and French West Africa, north by Libya, east by Anglo-Egyptian Sudan and southeast by the Belgian Congo. Cameroun, the southeastern part of the former German colony of Kamerun, is under French trusteeship and administered separately. Areas and populations are:

	Area (sq. mi.)	Population 1936 est.	1950 est.
Gabon	103,089	409,700	409,000
Middle Congo	132,046	746,800	684,000
Ubangi-Shari	238,224	833,900	1,072,000
Chad	495,752	1,432,600	2,241,000
Total	969,111	3,423,000	4,406,000*
Cameroun	170,230	2,389,500	3,006,000†

*Including 20,120 Europeans (c. 33% French). †Including 12,021 Europeans (10,252 French).

The native population is mainly Bantu, but there are semi-Hamitic, semi-Negroid pastoralists in northern savannah districts. Religion: animism; Chad, Moslem 46%; c. 280,000 Christians in Gabon and Middle Congo. Chief towns: Brazzaville, capital of Afrique Equatoriale Française (A.E.F.) (pop., 1949 est., 83,579, including 4,353 Europeans); Bangui (1948 est., 41,000); Fort Lamy (18,300); Libreville (12,600); Yaoundé, capital of Cameroun (1946 est., 50,000). High commissioner in A.E.F., Gov. Gen. Paul Chauvet. Governors in 1952: Gabon, Yves Digo; Middle Congo, Jean Chambon; Ubangi-Shari, Louis Grimald; Chad, Ignace Colombani. High commissioner in Cameroun, André Soucadaux.

History.—The centenary of Savorgnan de Brazza, founder of the French Congo, was celebrated in Brazzaville in Jan. 1952. Louis Jacquinot, minister of overseas France, was present.

Elections to the territorial assemblies were held on March 30. Throughout A.E.F. the Rassemblement du Peuple Français (R.P.F.) was successful in the first college (for Europeans), but in Middle Congo and Ubangi the Rassemblement Démocratique Africain, which once had Communist affiliations, improved its position in the second (for the local citizen electorate). Some defeated candidates started riots in the Logone region, in which there were 14 casualties. In Cameroun the R.P.F. was successful in the first college, the moderates in the second. Louis Paul Aujoulat, secretary of state for overseas France, who had been elected by the second college, became president of the territorial assembly. The senatorial elections in May had equivalent results.

A court of appeal was established at Yaoundé. Cameroun became independent of A.E.F. judicially as it had already been administratively.

In the economic sphere there was a notable extension of the scheme for cotton in A.E.F. The federation's resources, however, were adversely affected by the fall in world prices, and budgetary cuts were necessary. But 75,000 cu.m. of stripped wood and plywood were produced.

Cameroun's railways were repaired, and traffic was doubled compared with that before World War II. Progress was being made on the Douala-Yaoundé line and on harbour works at Douala.

The Logone-Chad mission, which had set out six years before, was still conducting scientific investigations in the Chad region; soil and water studies were undertaken and a map was being made. The hypothesis that the waters of the Logone river would be "captured" by the Bénoué river system seemed unlikely to be realized in the near future.

Both the A.E.F. and Cameroun began experiments in elementary education and short-term technical instruction. A tentative administrative regrouping was undertaken of some villages in the forest region of Gabon.

Education.—(1952) A.E.F.: pupils, elementary 88,800; secondary 1,761; technical 2,995; bursaries in France 176. Cameroun: elementary 157,647; secondary 1,372; technical 446; bursaries in France 206.

Finance.—A.E.F.: budget (1951 est.), balanced at 8,700,000,000 fr. C. F. A. Cameroun: budget (1951 est.), balanced at 4,682,000,000 fr. C. F. A. Note circulation (Dec. 1951) 9,600,000,000 fr. C. F. A. Franc C. F. A. (Colonies Françaises d'Afrique)=2 metropolitan francs. Exchange rate (1952): 350 metropolitan francs=U.S. \$1.

Foreign Trade.—(1951) A.E.F.: imports 18,200,000,000 fr. C. F. A. (including 12,000,000,000 fr. from the French union); exports 11,700,000,000 fr. C. F. A. (including 8,300,000,000 fr. to the French union), mainly ginned cotton, timber and coffee; also gold, diamonds, vegetable oils, cacao. Cameroun: imports 16,500,000,000 fr. C. F. A. (including 13,000,000,000 fr. from the French union); exports 14,400,000,000 fr. C. F. A. (including 7,200,000,000 fr. to the French union), principally cacao, coffee, almonds, palm oil and bananas; also timber and rubber.

Transport and Communications.—Motor vehicles (1951) 13,300. Tonnage (metric) handled at ports: Douala 650,000; Pointe Noire 300,000. (Hu. De.)

French Guiana. An overseas *département* of France on the northeast coast of South America. Area, including territory of Inini, 34,740 sq.mi. Pop. (1946 census)

29,160 (including Inini, 5,042); (1951 est.) 26,000. The lowland population is Negro or mixed; Europeans c. 5%; aboriginal Indians. Religion, mainly Roman Catholic. Capital and chief port, Cayenne (pop., 1948 est., 11,700). Prefect, Robert Vignon.

History.—In the 1952 senatorial elections, a Radical won the seat. At Cayenne work was begun on the buildings for the French Institute of Tropical America and for the Pasteur Institute. Cayenne Island was cleared of mosquitoes by a campaign and by marsh drainage. Electricity was being brought to the coastal communes.

Materials required for the development of the *département* accounted for 37% of the total imports in 1951 (compared 10% in 1947). A cargo vessel was acquired in order that timber could be exported direct. The output of gold rose to 37 tons. A joint Franco-U.S. mission investigated the tantalite deposits in the Sinnamary region.

Education.—One school in each commune; college at Cayenne.

Finance and Foreign Trade.—(1951): Imports 2,085,000,000 fr. (including 1,700,000,000 fr. from the French union); exports 203,000,000 fr. (including 170,000,000 to the French union), notably gold (125,000 fr.) and timber (25,000,000 fr.). Monetary unit: metropolitan franc. An exchange rate in 1952 of 350 fr.=U.S. \$1.

Transport and Communications.—Roads 36 km.; motor vehicles 10. Communications are mainly by sea and river. (Hu. De.)

French Guinea: see FRENCH WEST AFRICA.

French India. This group of four settlements in India had a total area of 193 sq.mi. Pop. (1948 est.) 317,300. Areas and populations of the four settlements are:

	Area (sq.mi.)	Population (1938 est.)
Pondicherry	112	181,000
Karikal	52	62,500
Mahé	23	13,400
Yanaon	6	5,400

Language: Tamil. Seat of administration, Pondicherry (1948 est., 22,572). Commissioner, André Ménard.

History.—The directors of policy in French India being French and resisting agitation for union with India, the minister of the Indian republic, Jawaharlal Nehru, announced in Oct. 1952 that he would not accept a referendum, and called for the immediate cession of the four territories.

The textile industry was in difficulties: raw cotton could no longer be bought from India and so had to come from Pakistan; prices therefore went up. In Karikal a serious effort was made to develop the rice fields; the deficiency of rice supplies was made up by purchases from Indochina. In spite of all this the budget showed a surplus.

Education.—Pupils (1952): primary 15,000; secondary 1,200; teachers 32; undergoing higher education 29. Bursaries in France 24.

Finance and Foreign Trade.—Exports, mainly to the French union, consisted (90%) of cotton goods (41,000 metric tons, worth Rs. 55,000,000). Monetary unit: rupee=73.50 metropolitan francs, or 21 cent (1952). (Hu. De.)

French Indochina: see INDOCHINA.

French Literature. The chief literary event of 1952, a year notable for much work of distinction, was the posthumous publication of Marcel Proust's *Jean Santeuil* (1,000 pp., 3 vol. with a preface by André Gide). In this work, written between 1896 and 1900, most of the later Proustian themes could be discerned; but the essential quality that had endowed *A la recherche du temps perdu* with its enchantment was missing. Admiration for Proust was passionate, and the Société des Amis de Marcel Proust and Amis de Combray published two bulletins.

Having finished his eight-volume novel *La Mort est un commencement*, Paul Vialar began a new cyclic work, *La Chasse aux hommes*, the two first books of which, *Le Rendez-vous* and

ête de chasse, appeared. Among the many novels that interested the critics and the public were: *Les Amours et les haines*, sequel to *Madame Maillart*, by Claude Aveline; *Lève-toi et marche* by Hervé Bazin; *Soleil au ventre*, a presentation of the war in Indochina, by Jean Hougron; *Les Saints sont en enfer*, about worker priests, by Gilbert Cesbron; *Le Préau* (Prix des Critiques), a tale of childhood and adolescence, by Georges Orgeaud; *Sylvia* by Emmanuel Berl; *Antonin* by Henri Bosco; *Le Hussard sur le toit*, the life of a young Piedmontese carabinieri in 1835–40, by Jean Giono; *La Flamme et le vent*, the thoughts of a Protestant country pastor, by Henri Hatzfeld; *Le dimanche de la vie* by Raymond Queneau; *La Jeunesse déchirée* by Jeanne Galzy; *L'Aventure est en nous* by Maurice Genevoix; and *Mariage de couleurs* by Maurice Bedel. François Mauriac produced *Galigaï* and also *Le Mal*, a novel dating from 1924, the English translation of which had been a success. Georges Duhamel produced *Cri des profondeurs*. Marguerite Yourcenar's *Mémoires d'Hadrien* and Jacques Perry's *L'Amour est rien* (a novel of psychological analysis in the Stendhalian manner) won great praise from the critics (notably from Robert Kemp). A collected edition of his works called attention again to the precocious talent of Raymond Radiguet (1903–23). Pessimism and cynicism characterized the portrayal of personalities and social groups in several novels by young writers: for instance, *Je suis un monstre* by Jean Meckert; *La Plaie et le couleuvre* by Guy Le Clec'h; *Si j'avais voulu* by Marcel Haedrich; *Les Lézards dans l'horloge* by Armand Lanoux. Akin to these *romans noirs* was Jean-Paul Sartre's study *Saint-Genet comédien martyr*, a thoroughgoing eulogy of Jean Genet, vagrant, thief and homosexual but also a talented writer. Yet another provocative book, which incurred very severe criticism, was *Féerie pour une autre fois* by Louis-Ferdinand Céline, who had been punished with *indignité nationale* for his conduct during World War II.

Among poets, Guillaume Apollinaire was brought to the forefront with *Tendre comme le souvenir* (about 200 previously unpublished letters to Madeleine, his friend of 1915) and *Le Guetteur élancolique* (unpublished poems, with a preface by André Salmon); and André Rouveyre and Henri Matisse published a critical essay, *Apollinaire*. Elvire Chouveau produced a new edition of Arthur Rimbaud's *Poésies* and Georges Duhamel published *Vues sur Rimbaud*. Paul Valéry's *Lettres à quelques-uns* made their appearance. Paul Eluard's *Le Phenix* and Pierre Emmanuel's *Babel* are worthy of mention, and the critics commended the books of Charles Maurras (*La Balance intérieure*, humanist in inspiration) and André Salmon (*Les Etoiles*, *l'encrier*—melancholy and macabre, in the style of Max Jacob).

Memoirs included Romain Rolland's *Le Cloître et la rue* (recalling his youth at the École Normale Supérieure); Julien Benda's *Mémoires d'infratombe* (full of malicious remarks and scathing character-sketches); Jacques Porel's *Fils de Jeanne*; Alfred Fabre-Luce's *Journal 1951*; Edouard Herriot's *dis* (2 vol., *Avant la première guerre mondiale* and *D'une terre à l'autre*); and André François-Poncet's *Carnets d'un pitif* (on his experience as a deportee in Germany in World War II). Under the same heading come Benjamin Constant's *Journal intimes* (ed. Alfred Roulin and Charles Roth; the first complete text, taken from the manuscript).

The most important works of literary history were André Malraux's *Sainte-Beuve, sa vie et son temps* (Prix des Ambassadeurs), and André Maurois's *Lélia, ou la vie de George Sand*, one of his best biographies. Others were Henri Martineau's *Le roman de Stendhal*, J. F. Angelloz' *Rilke* and P. Andrieu's *Drieu le moine et visionnaire* (on Drieu La Rochelle, a writer who killed himself at the end of World War II). The Mérimée-Turgenev

GEORGES SIMENON, Belgian mystery writer whose Inspector Maigret was popular in 17 languages, shown against a French background typical of his psychological crime novels. He was elected to the Royal Belgian Academy of French Language and Literature in May 1952

letters were edited by Maurice Parturier. Claudel's *Correspondance* with Francis Jammes and Gabriel Frizeau (1897–1938, a middle-class art-lover of Bordeaux) showed how he reconverted them to Catholicism, a success that made up for his failure with André Gide.

The 150th anniversary of Victor Hugo's birth was commemorated by the publication of *Pierres*, unpublished writings edited by Henri Guillemin; of *Juliette Drouet, mille et une lettres d'amour à Victor Hugo*, presented by Paul Souchon; of Henri Guillemin's *Victor Hugo par lui-même*; and of Louis Perche's *Victor Hugo* (a study with selections). Louis Aragon, the Communist poet, also published a "Victor Hugo" for the masses, following the line dictated by the U.S.S.R. and the "peace fighters." The Communists made an effort to capture Hugo for themselves (since "bourgeois" literary circles were somewhat inclined to disparage or question his worth), as they likewise did Leonardo da Vinci. The centenary of Paul Bourget (no longer read) provided an occasion for determining Bourget's place in French literature as the painter of the upper-class society that the two world wars destroyed. Quieter celebrations marked the centenary of the anti-naturalist Émile Zola, author of the novel *Les Oiseaux s'envolent et les fleurs tombent*. The 50th anniversary of the death of Zola, who was still esteemed by the

people, was marked by discussion of his merits and defects.

A vehement controversy broke forth between Jean-Paul Sartre and Albert Camus after Sartre's periodical *Les Temps modernes* had published a sternly unfavourable review of Camus's book *L'Homme révolté*. Raymond Aron joined in, taking sides against Sartre in *Le Figaro littéraire*. The quarrel served to emphasize the importance of political ideology in contemporary literature. Sartre, despite his overtures to the Communist party (held by him to be the only possible defender of the working class), remained anathema to the Stalinists, who denounced him as typical of western literature at its most decadent. (See also LITERARY PRIZES.) (A. PR.)

French Overseas Territories: see FRENCH UNION.

French Pacific Islands: see PACIFIC ISLANDS, FRENCH.

French Union. With the establishment, by the constitution of 1946, of the French union, in which are comprised both the mother country and the former empire, the old colonial terminology was abolished and for the colonies were substituted four categories of overseas regions. The older, completely assimilated colonies claimed recognition as French *départements* administered as in the mother country; the others became overseas territories (*territoires d'outre-mer*) which thenceforward would elect representatives to parliament and would have their own local assemblies possessed of wide powers; the trust territories, to be known in future as *territoires associés*, were similar in structure to the overseas territories and had the same electoral privileges; lastly, there were the former protectorates, now styled *états associés*, which could belong to the union only by an act of voluntary accession. Total area of the overseas territories of the French union: approximately 4,543,793 sq.mi.; total population (1948-51 est.) 80,153,000. Certain essential information on the component parts of the French union is given in the table. (See also separate articles.)

History.—The assemblies of the several territories had been set up by various decrees *ad hoc* and so had various names until Jan. 25, 1952, when a new law gave them their definitive organization as the territorial assemblies. The membership was increased. Except in Senegal and in Togo, where there were only single electoral colleges, the double-college system obtained everywhere, the Europeans having their own representatives, who were always fewer in number (sometimes considerably fewer; e.g., in the Comoros, where there were 4 Europeans and 20 Comorians) than the local representatives. Elections to the new assemblies took place on March 30.

The centre and the right were strengthened by the elections to the council of the republic in May. Gaston Monnerville was re-elected president.

Albert Sarraut, who celebrated his 80th birthday, was re-elected president of the assembly of the French union and continued to demand real powers for it. New members for metropolitan France were elected to the assembly: the Rassemblement du Peuple Français gained seats from the Mouvement Républicain Populaire and from the Communists. The high council of the union met once. Prince Buu-Loc was appointed high commissioner of Vietnam in France.

The government of Antoine Pinay took office in March, with Pierre Pfimlin replacing Louis Jacquinot as minister for overseas France, Jean Letourneau remaining minister for associated states and Robert Schuman minister for foreign affairs (responsible for Tunisia and Morocco). With the support of the centre and of a section of the right, the government defended the French position in Morocco and in Tunisia against the demands of the local princes and of the Arab states.

Togoland	20,463	781,000	958,000

*Territory of Upper Volta was formed on Jan. 4, 1947, from parts of Sudan, Ivory Coast and Niger.

Population: (1951 est.) French West Africa 17,380,000; Togoland 1,015,000; mainly Negro; some Arab and Berber admixture in the savannah; European (1951). c. 63,000 (including 50,000 French) in the A.O.F., 841 (1948) in Togoland. Religion: animist 53.4%; Moslem 44.2%; Christian 2.4%. Chief towns (pop., 1948 est., unless otherwise stated): Dakar (capital of A.O.F., 1951 est., 330,000); Saint-Louis (62,900); Abidjan (1952 est., 100,000); Conakry (38,000); Abidjan (36,000); Porto Novo (31,000); Lomé (capital of Togoland, 30,000). High commissioner in A.O.F., Gov. Gen. Bernard Cornut-Latour. Governors: Mauritania, Pierre Mesmer; Senegal, Louis Lyautey; Sudan, Salvador Etcheberry; Upper Volta, Albert Bourgeois; Niger, Fernand Casimir; Ivory Coast, Camille Chautau; French Guinea, Paul Sirieux; Dahomey, Charles Bonfils; Togoland, Laurent Pécoux.

History.—Elections to the territorial assemblies were held March 30, 1952. The Rassemblement du Peuple Français gained seats in the first college. In the second college the Rassemblement Démocratique Africain had successes in the Ivory Coast and in the Sudan, while Sedar Senghor's Bloc Démocratique Sénégalais finally routed Lamine Gueye's Socialists in Senegal, the last-named being victorious only in Dakar. Lamine Gueye ceased to be president of the Grand Council of A.O.F. In 1950 there was a pro-French majority, but the Comité d'Union Française (the independence party) won eight seats. The senatorial elections confirmed these results: the Socialist senators were defeated in Senegal; and the pro-French Parti Togolais du Progrès was victorious in Togo.

Dakar, with a traffic of 3,500,000 tons, became the third largest French port, on a par with Algiers. The tonnage handled at Abidjan (700,000) surpassed all expectation. An agreement was concluded with Canadian and British concerns for exploitation of the iron mines of Fort Gouraud (Mauritania).

Work to promote rice growing was continued in the lower valley of the Senegal. On the Middle Niger 69½ sq.mi. were already irrigated by the Niger office's irrigation scheme: 25,000 African workers were settled there, and production amounted to 200 metric tons of paddy and 2,000 metric tons of raw cotton.

The output of bauxite from the Guinea deposit (Iles de Los) rose to 150,000 metric tons. Plans were envisaged for making the Conakry iron mines yield 1,000,000 metric tons and for exploiting hydroelectricity.

Education.—(1952) A.O.F.: primary schools 1,130, pupils 170,000; secondary schools, pupils 6,435; technical schools, pupils 2,250; students undergoing further education 135; students in France 809. Togo: primary schools 255, pupils 41,163; secondary schools, pupils 828; technical schools, pupils 237; students in France 96.

Finance and Banking.—Note circulation 28,000 fr. C. F. A. Monetary unit: franc C. F. A. (Colonies Françaises d'Afrique)=2 metropolitan francs. In 1952, 350 metropolitan francs=U.S. \$1.00.

Foreign Trade.—(1951) A.O.F.: imports 61,335,000,000 fr. C. F. A. (including 50,700,000,000 fr. from the French union); exports 38,697,000,000 fr. C. F. A. (including 32,500,000,000 fr. to the French union). Principal exports: mainly peanuts and peanut oils 11,650,000,000 fr.; palm kernels and palm oil 1,100,000,000 fr.; coffee 9,500,000,000 fr.; cocoa 6,150,000,000 fr.; bananas 1,120,000,000 fr.; wood 1,100,000,000 fr. Togo: imports 2,330,000,000 fr. C. F. A.; exports 2,698,000,000

fr., mainly cocoa, coffee, palm kernels and copra. **Communications.**—Motor vehicles 32,000. Ships entered 4,500 (including 3,000 at Dakar). Aircraft landed (Dakar) 4,500. (Hu. De.)

Frequency Modulation: see RADIO.

Friends, Religious Society of. This Protestant group, the members of which are also called Quakers, began in England in 1652, when George Fox, a wandering minister who preached the doctrine of the "inner Divine Light" that was in every man, first gained a considerable following. The year 1952 was therefore the tercentenary of the society. During 300 years the Society of Friends had grown to about 180,000 members, most of whom were in England and North America, although there were vigorous groups of Friends in most countries of the world.

Appropriately for this 300th anniversary, a world conference of Friends was held at Oxford, Eng., July 28 to Aug. 6. Nine hundred delegates spent the week in discussion and consideration of action on Quaker concerns such as peace, social and economic justice, race relations, social service and the Quaker faith. There were no official pronouncements, as the 53 Yearly Meetings of Friends are highly independent, but a brief message to "Peoples Everywhere" was issued as a reminder of the failure of war and a call to reconciliation. A statement on the Korean war, asking that new and constructive efforts to establish peace be made, was sent to the foreign offices of the major national powers, to the United Nations secretariat and to the negotiators at Panmunjom, Korea.

While they were in England, many Friends, both delegates and nondelegates, took part in commemoration activities at some of the sites prominent in English Quaker history, including a tour over part of the route of George Fox's travels.

Three books of notable Quaker interest were published in the summer of 1952. Elizabeth Gray Vining, for four years Quaker tutor of the heir to the Japanese throne, wrote an account of her experience in *Windows for the Crown Prince*. *Friends for 300 Years* by Howard H. Brinton was an interpretation of Quakerism's place in Christianity as well as a study of its development over three centuries. John L. Nickalls, librarian of Friends library, London, was editor of a new edition of George Fox's classic *Journal*.

Encouragement of efforts to reduce international tension continued to be a major concern with the Society of Friends. In August the American Friends Service committee published a pamphlet, *Toward Security Through Disarmament*, which suggested ways in which international disarmament might be begun. Local meetings all over the United States, as well as the Friends Committee on National Legislation, took an active part in protesting the Universal Military Training bill introduced into congress in the spring of 1952.

In August Howard H. Brinton resigned as director of Pendle Hill, a Quaker school of graduate studies near Philadelphia, Pa. He had served as director for 16 years, during which time Pendle Hill became well known for its program of informal study and as a centre for conferences and retreats. Through books, articles and addresses he had come to be recognized as a foremost interpreter of Quaker thought. (See also CHURCH MEMBERSHIP.) (Ly. W. R.)

Frozen Foods. Consumption of frozen foods in the U.S. in 1952 was approximately tenfold that of pre-World War II. This sharply rising trend represented a major development in food processing, retailing and dietary culture. The widespread availability of electricity, the vast increase in number of home freezers and community locker plants, the development of freezing technology, and the development of

*As of Sept. 30.

retail handling of frozen foods, particularly in their application to fruits, juices and vegetables, were major aspects of the growth. The frozen concentrated orange juice business, which began only five years before, grew in 1952 to a volume of 40,000,000 gal. One major company dropped wholesale orange juice prices 20% at one time during the year. A survey of retail grocers indicated that they anticipated that sales of frozen foods would triple in the next five years. Higher ceiling prices were approved in May for most frozen foods. Storage holdings of most frozen foods increased compared with the previous year.

Among the dozen or more frozen fruits, strawberries (129,372,000 lb.), cherries (50,318,000 lb.), peaches and raspberries made up about four-fifths of the total. Green peas were the leading vegetable with nearly two-fifths of the total.

Some much discussed research apparently indicated that the advantages of home freezers were to be found in convenience rather than economy, unless the foods were home produced or obtained at substantial wholesale discounts. Home freezer sales during the first eight months of the year amounted to 521,000 units and for the full year were expected to exceed \$500,000,000 in value.

(J. K. R.)

Fruit. Estimated total U.S. production of deciduous fruits in 1952 was 9% below that of 1951 and 4% less than average for the decade. All major crops, except pears, were below the previous year. A record orange crop was indicated for Florida, whereas grapefruit were less promising than in 1951. Carryover stocks of most canned and processed fruits were substantial but the 1952 canned pack was about 10% smaller than in 1951. Government activities in regard to fruit came to public attention in 1952 in several ways. In March, the marketing order regulating the shipment of oranges from California and Arizona was terminated because of lack of support among growers. In July, price controls were removed from almost all fresh and processed fruits. The tariff on imported dried figs was increased from 2½ to 4½ cents per pound by presidential proclamation in August. Substantial amounts of fresh apples, pears and oranges and some dried fruits, raisins, figs and prunes, were moved to foreign countries under export payment programs. These programs and the increased tariffs on some imports caused Turkey and Greece to protest before the membership of the General Agreement on Trade and Tariffs.

World trade in fruit in 1952-53 seemed likely to fall below the large volume of 1951-52, not because of short crops in exporting areas but because of favourable crops in European importing countries, financial problems and some decline in export subsidy programs. The United Kingdom cut fruit import quotas for the last half of 1952 from nonsterling soft currency countries, mostly western Europe, by 57% to 77%.

Apples.—The 1952 commercial apple crop was indicated at 95,975,000 bu., 13% less than the 110,660,000 bu. of 1951 or average. Prices were higher in 1952 than in 1951, averaging \$2.56 per bushel to producers in September, against \$2.01 per

Table I.—U.S. Commercial Apple Production by Leading States

bushel at the same time in 1951.

Indicated world apple production of 613,418,000 bu., including cider apple, was 20% more than the 1951 crop, but below the 718,640,000 bu. of 1950. International trade in apples in 1951 amounted to 35,000,000 bu., compared with 23,000,000 in 1950 and 33,000,000 bu. before World War II.

Apricots.—The U.S. commercial crop of 1952, produced mostly in California, was 174,000 tons (fresh basis), 5% below the 183,200 tons in 1951 and 24% below the average, 1941-50 of 228,740 tons. The season average price approximated that of 1951. There was less demand by canners, because stock left over from the large 1951 pack of 4,600,000 cases were 5% larger than a year before. The dried apricot pack was larger than the small one of 1951. The world apricot crop was indicated at 637,000 short tons, 3% smaller than in 1951. The world dried apricot pack of 21,500 tons was only 75% of average.

Avocados.—The 1952 crop of California and Florida was moderately larger than the 36,000 tons of 1951, and summer varieties were of very good quality.

Bananas.—U.S. imports of bananas in 1951-52 were 49,000,000 bunches, averaging 50 lb. each, and valued at \$54,432,000. Imports of the previous year were 50,303,000 bunches. In spite of larger demand, only 97,200,000 bunches entered world trade compared with 98,100,000 bunches in the previous year and 111,600,000 bunches pre-World War II.

Cherries.—The total commercial cherry crop of 1952 was estimated at 202,000 tons; the 1951 crop was 230,000 tons, the 1941-50 average was 191,000 tons. The sour cherry crop was only 105,850 tons, compared with a record 158,240 tons in 1951, but slightly above the 98,983 ton average for 1941-50. The larger Western-produced sweet cherry crop was estimated at 95,930 tons, 34% above 1951 and 4% above the average for the decade. The world cherry crop was indicated at 1,239,000 short tons, 2% below 1951 but 21% more than prewar.

Cranberries.—The indicated 1952 crop of 812,500 bbl. was sharply below the 910,300 bbl. of 1951, but exceeded the 1941-50 average of 769,660 bbl. Massachusetts was expected to produce 450,000 bbl. and Wisconsin 195,000 bbl. Prices at harvest were \$19 to \$22 per bushel, compared with \$15 to \$16 per bushel in 1951.

Dates.—In addition to a California crop of about 17,000 boxes, the U.S. imported dates amounting to 41,643,000 lb. in 1951-52.

Figs.—The 1952 U.S. fig crop was of good quality, and the harvest was near in size to the 44,000 tons of 1951, of which 30,000 tons were dried. The U.S. department of agriculture in September announced a program to assist fig producers in the disposal of surplus dried figs.

The world pack of dried figs in 1951 was 171,000 tons, below the 10-yr. average.

Grapefruit.—The indicated 1952-53 crop, with California summer crop unaccounted for, was 37,210,000 boxes, 5% below the 40,370,000 boxes of 1951-52 (not all of which were used) and an average for the previous decade of 51,222,000 boxes.

*Boxes hold 77 lb. in California and Arizona; 90 lb. in other states.

The 1951-52 world grapefruit crop was estimated at 44,997,000 boxes, about 90% of which was U.S. produced.

Grapes.—The U.S. crop of all varieties for all purposes was indicated at 3,092,000 tons, 9% less than the record 1951 tonnage of 3,385,000, but 10% above the average for 1941-50 of 2,807,710 tons. California with a very large part of the total tonnage accounted for much of the decline (2,912,000 tons in 1952; 3,224,000 tons in 1951). World raisin production in 1952 was about 531,600 tons, compared with 460,200 tons in 1951, and the second largest pack on record.

Lemons.—The California lemon crop of 1952-53 was slightly larger than the 12,600,000 boxes of 1951-52. The world 1951-52 crop of lemons was estimated at 29,000,000 boxes, of which 5% were produced outside of the U.S.

Limes.—The Florida lime crop of 1952-53 was indicated as a large one—300,000 boxes, compared with 260,000 the previous year and an average of 204,000 for the preceding decade. The heavy run from June to September brought a lower price than in 1951.

The world crop in 1951-52 was estimated at 3,674,000 boxes, about half of which were produced in Mexico.

Olives.—The indicated olive crop of California was 55,000 or 60,000 tons, below the 64,000 tons of 1951, but above the 1941-50 average of 46,400 tons. The 1951-52 Spanish olive pack of export types was revised downward to 60,600 tons.

Oranges.—The total U.S. early and midseason orange crop was estimated at 61,587,000 boxes, compared with 57,100,000 in 1951 and an average for 1941-50 of 47,992,000 boxes.

The world orange crop of 1951-52 was estimated at 302,790,000 boxes, about 41% of it produced in the U.S., followed by Spain (35,270,000 boxes), Brazil and Italy. The 1952-53 orange crop of Spain was estimated at 1,300,000 tons, 30% more than the previous year, from which 720,000 tons were exported.

International trade in citrus, mostly (85%) oranges but some grapefruit and lemons, amounted to 67,800,000 boxes or about 3% of world production in 1951, compared with 58,000,000 boxes in 1950 and 65,000,000 boxes prewar. The U.S. exported 800,000 boxes of oranges, 1,600,000 boxes of grapefruit and 30,000 boxes of lemons, mostly to Canada.

Tangerines.—The Florida crop for 1952-53 was indicated at 700,000 boxes, compared with 4,500,000 in the preceding year and an average crop of 4,100,000 boxes.

Peaches.—The U.S. 1952 peach crop, estimated at 62,622,000

Table IV.—U.S. Pear Production by Leading States

(In thousands of bushels)

State	Indicated 1952	1951	Average 1941-50	State	Indicated 1952	Average 1951 1941-50

Others	1,368	1,584	1,815	Mississippi	162	126

bu., was exceeded slightly by the 63,627,000 bu. of 1951 and substantially by the 1941-50 average of 68,186,000 bu. The California clingstone crop was 19,085,000 bu., 22% smaller than 1951 and slightly under average.

World production was indicated at 104,000,000 bu., about the same as in 1951 but 19% above prewar. The world pack of dried peaches of 12,500 tons in 1951 was only 51% of average.

Plums and Prunes.—The U.S. plum and prune crops of 1952 were comparatively small ones. The California plum crop was 56,000 tons—in 1951 it was 97,000 tons and the 1941-50 average was 79,000 tons. Michigan produced 7,800 tons against 4,800 in 1951 and an average of 5,060 tons.

The so-called fresh prune crop of the Pacific northwest of 86,900 tons, compared with 95,400 tons in 1951 and an average for 1941-50 of 115,000 tons, was more than one-half sold fresh, about one-fourth canned, the remainder frozen or used locally.

The dried prune crop, largely produced in California, was 137,300 tons, small compared with 180,200 tons in 1951 and an average for 1941-50 of 187,500 tons.

The 1952 world production was indicated at 2,678,000 short tons of plums and prunes, fresh basis, compared with 2,976,000 tons in 1951. The 1952 estimated dried prune pack of the leading producing countries in 1952 was 174,400 tons compared with 225,700 tons in 1951, and 21% below the average for 1941-50.

Pears.—The 1952 U.S. pear crop, indicated at 30,879,000 bu., was 2% to 3% above 1951 and average.

World pear production was indicated at 201,783,000 bu., 36% more than 1951, the western European crop rising to 136,000,000 bu., compared with 86,000,000 in 1951 and a prewar average of 70,000,000 bu.

Pineapples.—World production was about 40,000,000 boxes, half of it in the Hawaiian Islands. Florida production was somewhat less than the 10,000 boxes of 1951.

Strawberries.—The U.S. 1952 indicated crop total was 11,972,000 crates of 24 qts. each, compared with 11,779,000 crates in 1951 and an average for 1941-50 of 8,762,000 crates. Prices received by growers were as high as \$7.45 per crate in the first half of May, but for the full season may not have been quite equal to the 1951 average of \$6.58 per crate. (See also FROZEN FOODS; HORTICULTURE.)

Furniture Industry. Indications during the third quarter of 1952 were that the 4,000 factories in the United States making wood, metal, rattan and upholstered furniture would match for the year, or even exceed, the all-time record \$1,550,000,000 output of 1951.

Early in the year prices of furniture dropped approximately 5%, chiefly as a result of competition, but at the fall markets in October some stiffening of prices occurred, since lumber and labour costs were advancing and some low-end items were being produced at a loss.

Shipments in Jan. 1952 were at a peak, 46% higher than in Jan. 1951. Then came a deluge of cancellations and hold orders, because of heavy inventories and too heavy receipt of merchandise. February shipments dropped to 14% below the comparable month a year earlier, and March shipments slipped to 18%

FLEXIBLE FURNITURE UNITS popular in 1952 for solving space and budget problems in the one-room apartment. The shelved and partitioned units could be used as storage cabinets and bookcases (by removal of sliding panels)

below. April deliveries, however, were down only 8% compared with April 1951, May shipments 6% and June 4%; then July shipments rose to 1% below and August rose again to even volume with the previous year. As the last quarter is the biggest volume season of the year, indications were that total shipments for 1952 would exceed or at least match those of 1951.

For the eight months ending in August the industry's shipments were only 8% lower in dollar volume than for the same period of 1951, although in February they were 16% lower.

At the January markets most factories presented more new designs than ever before, mostly Modern and French Provincial, many of them correlated groupings and interchangeable pieces suitable for living rooms, bedrooms or dining rooms. At the summer markets additional new designs in the lower price range appeared.

The 4,000 furniture factories in the U.S. are divided by products as follows: wooden furniture 2,250; upholstered furniture 1,390; metal furniture 309; reed, rattan and glass 50. (See also INTERIOR DECORATION.) (J. A. G.)

Furs. Despite prices that were generally lower than in 1951, retail sales of fur garments in the United States in 1952 did not show any improvement over the previous year. In fact, during the first part of the year, excise tax collections showed that business was trailing that of 1951. Going into the last quarter, indications were that the total retail volume would approximate that of the past several years—somewhere around \$250,000,000. Sales of furs had fallen off considerably since the period immediately after World War II, when they topped \$400,000,000 annually.

Mink once again led in popularity, with mutations in strongest demand. Pastels, platinums and the various other mutations sold relatively well in all types of styles—capotes, stoles, jackets, boleros, etc. Prices of standard dark ranch mink were lower in 1952 as demand for brown mink tapered off a bit. Production of mink on ranches in the United States was estimated at about 2,500,000 skins. There were about 500,000 skins raised on Canadian ranches and about 550,000 in the four Scandinavian countries.

In addition to mink, the best-selling furs in 1952 were Persian lamb, sheared raccoon, muskrat, mouton-processed lamb, squir-

rel and Alaska seal. The last named fur was in good demand as a high-fashion fur. In April, at the semiannual skin auction in St. Louis, Mo., prices declined for black sealskin, but only a small degree for the brown seal shades. At the October strong demand from dealers and manufacturers boosted average levels more than 30%, including a sensational rise more than 50% in blacks.

Persian lamb, of which about 4,000,000 skins are imported annually by the United States, was comparatively inexpensive throughout the year, but sold only moderately well. European buyers (mainly from Italy, Britain, Germany and Belgium) competed with U.S. and Canadian buyers for this article at big London sales, and took a considerable number of skins.

Credit became tighter in the fur trade during the year, following a high number of insolvencies during 1951. Bankruptcy continued to occur, although not so frequently. The great difficulty in obtaining credit was said to have held back an extension by manufacturers.

Two legislative acts had an effect on the fur trade. The first was the ban on seven Russian furs, ermine, kolinsky, weasels, marten, mink, muskrat and fox, which started on Jan. 5, 1952. Still permitted entry were several other important Russian furs including Persian lamb, squirrel, marmot and sable. Of the banned items, the most important were kolinsky and muskrat.

The other act was the Fur Products Labeling act, which came effective in August. It was designed to prevent consumer confusion, and specifically prohibited misleading descriptive material in advertisements. No longer could sheared muskrat be called Hudson seal, nor could rabbit be termed a coney or lamb.

In addition, specific regulations were imposed on comparative price advertisements, which required the retailer to substantiate any claims made in featuring his merchandise to the public.

Also of importance in the labelling regulations was the requirement that the country of origin be specified on imported furs. This was specifically aimed at the U.S.S.R. as a country of origin.

There were a few fur trends in 1952. The attempts to reestablish popularity of long-haired furs—principally the fox family—with a little better success than in 1950 and 1951. Black muffs received considerably more emphasis in fashionable New York stores and in leading magazines. Blond furs continued to be sold, including otter, opossum, sheared raccoon, nutria, beaver, but sales were restricted mainly to the larger cities.

Unemployment was high during most of the off season (July to June) and in many shops continued high into the normally busy season. Manufacturers continued to claim that retailers were overcautious in their buying, and retailers continued to blame the 20% federal excise tax for consumer resistance. (E. S.)

Gas, Natural and Manufactured. Only a few of the large producing gas report their output, so no world production data is available.

Natural Gas.—Table I shows the outputs of countries other than the United States where outputs are large enough to be significant.

United States.—The United States is by far the world's largest producer of natural gas, as is indicated by the data reported by the U.S. bureau of mines and summarized in Table II.

NATURAL GAS PIPE LINE originating in Texas and New Mexico, being lowered into place in Arizona. It ran parallel to a line already operating in 1952, and to increase the volume of gas being piped to California

Produced in U.S.	?	?	30,681	32,292	32,292	31,791

Manufactured Gas.—Manufactured gas is made and used in the quantities in areas where natural gas is not available or where the cost of long-distance transmission makes it uneconomical for use in large-scale industrial operations. Outputs of the more important producing countries are shown in Table

manufactured gas. (See also FEDERAL POWER COMMISSION; PETROLEUM.)
(G. A. Ro.)

Gasoline: see PETROLEUM.

Coke-Oven Gas.—By-product coke ovens produce about 100 cu.ft. of gas along with each ton of coke made; 36% is used to heat the ovens and 2% is lost by leakage, leaving 62% to use or sell as commercial fuel. In 1951 coke ovens in the United States produced 1,052,280,603,000 cu.ft. of gas, of which 653,350,680,000 cu.ft. were available for sale or use in steel plants, a volume equivalent to about 10% of the country's natural gas consumption and greater than the output of

Table II.—Production and Consumption of Natural Gas in the U.S.
(In thousands of millions of cubic feet)

	1946	1947	1948	1949	1950*	1951*
Production	6,190.2	6,733.2	7,178.8	7,546.8	8,497.7	9,689.4
Losses and waste	1,020.0	1,067.9	810.2	853.9	801.0	793.2

* Preliminary. † Mostly for repressuring oil fields; small amounts of surplus gas are returned to ground for storage. ‡ Includes manufactured gas, and not included in the consumption

Gasperi, Alcide de (1881–), Italian statesman, was born at Tesino, Trentino, April 3, studied at the University of Vienna, was elected to the Austrian parliament as an Italian minority representative in 1911, and after the union of his native province with Italy was elected to the Italian parliament in 1921. In 1926 he was sentenced to imprisonment for anti-Fascist activities. When released in 1931 he became an official of the Vatican library.

During World War II De Gasperi took part in the resistance movement in Rome, and in June 1944 he joined the first Ivanoe Bonomi cabinet as minister without portfolio. Minister of foreign affairs in the second Bonomi (Dec. 1944) and Ferruccio Parri (June 1945) cabinets, he was elected leader of the reconstructed Christian Democratic party and on Dec. 9, 1945, became prime minister. On Jan. 25, 1952, he went to Paris for talks on the European army, and on Feb. 22 was in Lisbon for defense discussions. On May 27, in Paris, he signed the European Defense Community treaty for Italy. On Aug. 31 he spoke at a rally at Boldazza, Bolsena, to celebrate his 40 years of active political life.

De Gasperi arrived in Bonn on Sept. 21 on his first official visit to the German Federal Republic of Germany. On Sept. 24,

at Aachen, he was awarded the Charlemagne prize for outstanding service to the cause of European unity. (See also ITALY.)

Gem Stones. The United States has no commercial output of precious stones (diamond, emerald, ruby or sapphire), but does have a considerable production of semi-precious and ornamental stones. Numerically these fall mostly in the silica group (agate, agatized wood, rose quartz, smoky quartz, chalcedony, chrysoprase, jasper and petrified wood), while the more valuable types include beryl, kunzite, nephrite jade, tourmaline, turquoise and other minor varieties.

Table I shows the imports of gem stones into the United States.

Table I.—U.S. Imports of Gem Stones

	1951		1950	
	Carats	Values	Carats	Values
Rough diamonds . . .	697,981	\$48,704,819	673,699	\$43,655,706
Cut diamonds . . .	480,516	61,858,003	492,741	58,531,035
Rough emeralds . . .	2,706	2,698	12,142	7,991
Cut emeralds . . .	20,148	264,527	9,706	237,446
Pearls, natural . . .		449,379		410,970
Pearls, cultured . . .		2,447,653		3,192,334
Marcasites . . .		88,395		136,768
Other varieties . . .				
Rough . . .		160,609		304,089
Cut . . .		2,686,137		2,429,992
Imitation . . .		12,431,422		9,601,718
Total . . .		\$129,275,642		\$118,508,049

The total value of gem imports is shown in Table II.

Table II.—Value of U.S. Imports of Gem Stones

1942	\$28,520,070	1947	\$110,076,029
1943	72,109,788	1948	115,940,031
1944	77,529,806	1949	84,132,466
1945	114,435,231	1950	118,508,049
1946	189,017,646	1951	129,275,642

There are no statistics on the output of gem stones in the United States, but the value of the crude material has been estimated to be of the order of \$500,000 a year, which would probably be more than doubled after cutting, but even so the total is small compared with imported gems. (See also DIAMONDS; MINERALOGY.)

(G. A. Ro.)

Genetics. The American Society of Human Genetics sponsored a symposium and panel discussion on "Counselling Clinics in Human Heredity" at its annual meeting held at Cornell university in Sept. 1952. Several such clinics were already in operation and steps were taken toward expanding and standardizing the program under competent personnel.

E. Kaplan, W. W. Zuelzer and J. V. Neel studied two families in which a new type of blood pigment, haemoglobin III, was determined by a dominant gene. The individuals heterozygous for this gene and that determining sickle-cell anaemia showed a blood picture intermediate between heterozygotes and homozygotes for the sickling gene.

F. J. Kallmann reported on aging and senile degeneration in identical and dizygotic twins. In some cases the twins lived under similar environments and in other cases under widely different environments. His data indicated that hereditary factors were important in the onset of senile psychoses. He concluded that: "An analysis of fully recorded twin histories cannot fail to be helpful in investigating the numerous challenging problems posed by severe maladjustments to aging and old age."

Mammalian Genetics.—W. E. Castle published linkage maps for the common rat, with six chromosomes having two or more gene loci represented, and five chromosomes with one marker gene each. L. C. Dunn and W. C. Morgan tested samples from several populations of wild mice, *Mus musculus*, by crossing to a tester stock heterozygous for the short-tail gene. The results of the test showed that a large proportion of wild mice

in the populations tested carried a mutant gene at the tested. The finding of several different mutant alleles at a locus indicated a high incidence of hidden genetic variability in the species.

E. D. Garber described a new recessive mutant, bald, and of hairlessness, in the mouse. D. S. Falconer and G. D. reported two new recessive hair mutants, rough and frizz, in the mouse. In the same species J. H. Fielder studied a new colour recessive, taupe, in which the females also showed atrophy of the mammary glands.

C. Stormont reported two new blood group systems in mice, each represented by a pair of alleles at a genetic locus. He demonstrated significant differences in the frequencies of alternative alleles at these loci in two different breeds of mice.

Plant Genetics.—L. Butler published revised linkage maps for the tomato. Each of the 12 chromosomes of the species was marked with at least 11 of the 35 gene loci plotted, and for 10 of 2 chromosomes eight-point maps were presented. L. Butler described a new dominant, golden, in wheat grown from seed exposed to the atomic blast at Bikini and presumably induced by the radiation. C. M. Rick made grafts of a new tomato mutant, wilted dwarf, onto normal plants. He studied the progeny from seed developed in both scion and stock. No alteration of these progeny (Lysenko effect) was found in subsequent generations. Marked alteration of scion resulting from diffusible substances transmitted from stock to scion. N. D. Zinder and J. Lederberg found that a filterable agent was released by the bacterium *Salmonella typhimurium* when attacked by certain bacteriophages. This agent could transfer genetic traits such as drug resistance and fermentation from one bacterium to another. This one-way transmission of genetic traits, which is mentally different from sexual recombination, was termed transduction.

Radiation Genetics.—Studies of the action of several factors in altering the mutation rate induced by various agents continued to occupy the attention of several investigators. L. S. Altenburg and E. Altenburg found that the induced mutation rate in *Drosophila* eggs from ultra-violet light treatment was lowered by posttreatment with photoreactivating agents. H. U. Meyer and H. J. Muller discovered that the ultra-violet induced mutation rate in *Drosophila* eggs was higher when treatment was given in nitrogen than when given in an oxygen atmosphere. When the inducing agent was X-rays, W. K. H. and E. S. von Halle found that radiation of *Drosophila* in nitrogen gave a lower mutation rate for dominant than radiation in oxygen. (See also BACTERIOLOGY.)

BIBLIOGRAPHY.—*Genetics*, vol. 37 (1952); *Journal of Heredity*, 43 (1952); R. B. Goldschmidt, *Understanding Heredity* (1952); S. Srb and R. D. Owen, *General Genetics* (1952). (W. F.)

Geography. **International Affairs.**—The third Pan American Consultation on Geography, which was held in Washington, D.C., from July 25 to Aug. 4, 1952, was attended by representatives of 18 nations of the western hemisphere. The consultation was sponsored by the United States government. The general theme of the conference—Geographic Planning and Resource Development—was carried out through the working sections in 12 separate half-day sessions. The consultation approved technical project no. 29, authorized by the Organization of American States, for the establishment of a technical centre in Latin America for the evaluation of natural resources. The fourth consultation was to be held in Mexico City in 1953.

The eighth general assembly of the International Geographical union met concurrently with the 17th International Geographical congress in Washington, D.C., Aug. 8–15. This was the first time in history that the congress convened in the United States, the previous meeting being in 1904. Registrations totalled

5,500 and more than 1,200 were in attendance. At least 450 of this number came from about 50 foreign countries. All 37 of the countries adhering to the union sent official delegates, and representatives were present also from several observer countries. The largest overseas delegations were from Great Britain, France, Germany, Italy and Brazil.

During the eight-day congress 31 individual sessions were held by the various commissions and sections of the International Geographical union, and symposia were conducted on tropical Africa and world food supply. Rio de Janeiro, Brazil, was selected as the site for the 18th International Geographical Congress for 1956.

The National Council of Geography Teachers held its 38th annual meeting in Washington, D.C., on Aug. 6-7. During the three general sessions and two special assemblies, approximately 30 papers were presented by members on subjects centering around the general theme of "Social, Economic, and Political Survival and Progress."

The Association of American Geographers also held its 48th annual meeting in Washington, D.C., on Aug. 6-7. There were papers presented on various topics during the three regular sessions and discussion panels were conducted on cartography and area studies.

The American Geographical Society of New York, celebrating its centennial in 1952, closed its ceremonies in New York City on Aug. 4 and 5 with a formal program in which five gold medals were awarded to distinguished world geographers. During the year the society's quarterly, the *Geographical Review*, published many scholarly articles, and the monthly publication *Focus* released studies on such timely topics as Pakistan, sources of the arctic, Great Britain, French Morocco, Venezuela and New York city. The society also published in 1952 its centennial volume *Geography in the Making: The American Geographical Society, 1851-1951*.

Geography in the Government.—With the exception of the army map service, the quartermasters corps and a few other U.S. government agencies, geographers are not concentrated in special branches of government service but are scattered throughout the many agencies. The great volume of geographic work being carried on by these government agencies during 1952 may be illustrated by a few examples selected from the department of state, the department of the interior and the department of commerce.

In the department of state the office of the geographer, established about 1921, was used to provide geographic data on boundary and territorial problems, immigration quotas, mapping matters, delimitations and claims to territorial waters, and numerous other aspects of geography. Progress was made during the year on the *Atlas of Ignorance*, designed to point out the lack of systematic data for many parts of the world. The Foreign Service institute of the department added to its staff a professor of geography, whose duties were to participate in the planning of a variety of programs for Point Four personnel, language-and-area officers, newly appointed foreign service officers and other international affairs specialists.

In the postwar years the department of the interior had emphasized resource conservation and development. This type of program was based upon a wide variety of studies and surveys. Some of these studies included reports on the regional economy and resources of Alaska, the Pacific northwest, the Colorado river-Great basin, the southwest and the Missouri basin. In addition the department had co-operated in interagency surveys of regional resource development in New England and in the basins of the Arkansas, White and Red rivers. Another important series of studies considered the water resources of the Columbia river, the central valley of California, the Missouri

river basin and the Colorado river.

The department of commerce through its area development division worked primarily in the fields of area and regional economic analysis, industrial development and dispersion, river basin development and urban development. During the year it initiated a series of studies designed to show the significant economic changes that had taken place in the geography of the national economy. The first of this series was published as the *Economic Development Atlas—Recent Changes in Regions and States*.

Geography in the Colleges and Universities.—*The Directory of College Geography of the United States*, published in May 1952, showed that nearly 5,500 courses in geography were being taught in 873 institutions of higher learning in the country, an increase of 2,000 courses and 146 institutions over the 1951 report. The *Directory* also revealed that the 34 universities which gave graduate work in geography had 325 candidates for the master's degrees and 187 candidates for the doctor's degrees. In connection with the Pan American Consultation on Geography and the International Geographical congress, a detailed study on the *Status of Geography in the United States, 1950-1952* was prepared and issued by the Pan American consultation as document 8. In the part of the report dealing with geography in institutions of higher learning, considerable detail was given concerning the work of leading departments of geography and their staffs, and the published research and research in progress by both faculty and graduate students. (See also CARTOGRAPHY; EXPLORATION AND DISCOVERY; NATIONAL GEOGRAPHIC SOCIETY; SOCIETIES AND ASSOCIATIONS, U.S.) (E. J. Fo.)

Geology. Trends in geologic advances and interests are best indicated by the text and reference books which have been published and by articles printed in professional journals. A noticeable development in 1952 was the appearance of numerous papers and books written by European, Asiatic and South American geologists describing and discussing the results of renewed world-wide activity by geologists of most nations. Also a greater number of important papers and books on mineral deposits and natural resources were published in 1952. The demand for well-trained graduates was greater than in 1951, and fewer geologists were graduated in 1952.

General and Historical Geology.—Both physical and historical geology were covered in a new text, *Geology* by O. D. von Engel and Kenneth E. Caster, and in *Introduction to Geology* by E. B. Branson and W. A. Tarr, revised by Carl C. Branson and W. D. Keller. Revised editions of *Principles of Physical Geology* by Arthur Holmes and *An Introduction to Historical Geology*, 6th ed., by William John Miller also were published.

Two vocabularies were made available. The Brazilian publication *Vocabulário Geológico* by Viktor Leinz and Josué Camargo Mendes contained synonyms in English and German. *Diccionario Minero, Metalurgico, Geologico, Mineralogico, Petrografico y de Petroleo* by Alejandro Novitzky, published in Argentina, contained English terms with their corresponding equivalents in Spanish, French, German and Russian.

Geologisch-Mijnbouwkundige Bibliografie van Indonesië by J. F. Steenhuis (1951), a bibliography on geology and mining in Indonesia, and *Bibliography and Index of Geology Exclusive of North America*, vol. 15, by Marie Siegrist and Marcia Lakeman were published.

Geomorphology, Glaciology and Marine Geology.—*South African Scenery—A Textbook of Geomorphology*, 2nd ed., by Lester C. King drew text matter and illustrative material from South Africa. In the *Bulletin* of the Geological Society of America there appeared "Annotated and Illustrated Bibliographic Material on the Morphology of Rivers" by P. F.

Nemenyi and "Dynamic Basis of Geomorphology" by Arthur N. Strahler.

A well-illustrated book, *Alpine Glaciers* by A. E. Lockington Vial was published in England.

Francis P. Shepard's paper, "Composite Origin of Submarine Canyons" in *Journal of Geology*, as well as papers on more specific problems, which appeared in *Journal of Geology* and the *Bulletin* of the American Association of Petroleum Geologists, attested to the continued interest in marine geology.

Stratigraphic Geology and Sedimentation.—More important publications on stratigraphic geology included: a chart prepared by Ralph W. Imlay, "Correlation of the Jurassic Formations of North America, Exclusive of Canada," published in the *Bulletin* of the Geological Society of America; "Sedimentation and Stratigraphy of the Upper Huronian of Upper Michigan" by S. A. Tyler and W. H. Twenhofel, published in the *American Journal of Science*; and "Correlation Chart of the Geologic Formations in Venezuela," prepared by the committee on geology of the Venezuelan Petroleum convention.

Published in *Journal of Geology* was a paper by W. C. Krumbein and R. M. Garrels, "Origin and Classification of Chemical Sediments in Terms of pH and Oxidation-Reduction Potentials," and a paper in *Journal of Sedimentary Petrology*, "Turbidity Currents, Graded and Non-Graded Deposits" by P. H. Kuenen and Henry W. Menard.

Petrology and Petrography.—A comprehensive study of the rockmaking processes and interpretation of new factual data was presented by T. F. W. Barth in *Theoretical Petrology*. An explanation of the nature of coal petrology, as carried on by polished surface and incident light methods, was given in *Atlas für Angewandte Steinkohlenpetrographie*, edited by the German Coal Mining management. James A. Noble in *Journal of Geology* discussed "Evaluation of Criteria for the Forcible Intrusion of Magma."

Structural Geology and Field Geology.—In *Geologic Structure and Orogenic History of Venezuela*, Walter H. Bucher described the structural units of Venezuela as outlined on the author's *Geologic-Tectonic Map of Venezuela* (1950). An enlarged second edition of *The Dynamics of Faulting and Dyke Formation, with Applications to Britain* (1951) by E. M. Anderson was published in London.

"Relations Between the Mechanism of the Formation of Fault Troughs and Volcanic Activity" by B. G. Escher and "Our Shrinking Globe" by Kenneth K. Landes were two important papers in the *Bulletin* of the Geological Society of America. The structural history of the Alps was presented by Ernst Kraus in *Die Baugeschichte der Alpen*, Teil I.

Plane Table Mapping by Julian W. Low and a fifth revision of *Field Geology* by Frederic H. Lahee were published.

Petroleum Geology.—*The Economics of United States and World Oil* by E. Ospina-Racines represented a contribution to the study of international economics of the oil industry. In a paper in *Erdöl und Kohle*, "Beiträge zur Erdölgeologie Südamerikas, I. Das obere Amazonas-Becken," J. E. Rassmuss discussed petroleum geology of the Amazon basin. *Oil Shale and Cannel Coal*, vol. 2 (1951), edited by George Sell, was a collection of papers contributed to the Second Oil and Cannel Coal conference. Of the numerous articles on petroleum geology, the following papers in the *Bulletin* of the American Association of Petroleum Geologists were significant: "Geology and Oil Fields of Brazil" by Earle F. Taylor, "Australian Oil Possibilities" by Frank Reeves, "Geological History and Petroleum Possibilities of the Philippines" by Earl M. Irving, "Early Diagenesis of California Basin Sediments in Relation to Origin of Oil" by K. O. Emery and S. G. Rittenberg, "Hydrological and Thermal Aspects of Petroleum Occurrence" by I. I. Chebotarev and

"Significance of Oil and Gas Seeps in World Oil Exploration" by Walter K. Link.

Mineral Deposits.—Rocks, soils and mineral deposits originate through weathering processes and sedimentation was treated by Paul Niggli in *Gesteine und Mineralagerstätten, Band II, Exogene Gesteine und Mineralagerstätten*. Much fundamental material and factual information was made available in three volumes of *Les Pegmatites-Las Pegmatites Gráficas*, a translation of the work of the Russian geologist A. Fersman. W. Uytendogaardt introduced *Tables for Microscopic Identification of Ore Minerals*.

Geologic Reconnaissance of the Mineral Deposits of Thailand by G. F. Brown and others and *The Geology and Mineral Resources of Jamaica* (1951) by H. R. Hose also became available.

The geology, recovery, uses and economics of antimony and titanium were well described in *Antimony*, 3rd ed. by C. Wang, and "Titan," *Gmelin's Handbuch der Anorganischen Chemie*, System-Nummer 41 (1951).

Atlas of World Mineral Resources edited by William F. Royen and Oliver Bowles, *Report of the President's Material Policy Commission* (Paley commission) and the *Future of Our Natural Resources* edited by Stephen Raushenbush were three comprehensive reports on natural resources.

Geochemistry.—Facts and ideas concerning the chemistry of the earth were summarized by Brian Mason in *Principles of Geochemistry*. R. W. van Bemmelen discussed "The Endogenic Energy of the Earth" and Z. L. Sujkowski discussed "Average Chemical Composition of Sedimentary Rocks" in the *American Journal of Science*.

The use of geochemistry and biogeochemistry as an aid in prospecting was discussed in papers appearing in *Economic Geology and the Bulletin of the Society of Economic Geologists*. "Abnormal Copper, Lead, and Zinc Content of Soil Near Metalliferous Veins" by Lyman C. Huff and "Preliminary Studies of the Biogeochemistry of Iron and Manganese" by Harry Warren, Robert E. Delavault and Ruth I. Irish. (See also MINERALOGY; OCEANOGRAPHY; PALAEONTOLOGY; SEISMOLOGY) (T. H. K.)

George, Walter Franklin (1878–), U.S. senator. He was born on Jan. 29 at Plover, Ga. He took his bachelor's and law degrees from Mercer University, Macon, Ga., in 1900 and 1901 respectively and began practising law at Vienna, Ga., in the latter year. From 1901 to 1912 he was solicitor general of a state judicial circuit, and from 1912 to 1917 judge of the circuit's superior court. In 1917 he became associate justice of the supreme court of Georgia, resigning in 1922 when he was elected U.S. senator from Georgia to fill a vacancy. He was re-elected in Nov. 1950 for a sixth consecutive term (1951–57). In 1938 Pres. Franklin Roosevelt's attempt to purge George as a reactionary failed when the senator won the Democratic nomination easily over Roosevelt's candidate. Thereafter a prominent member of anti-New Deal Democrats, George became known for his vehement criticism of government spending.

In 1950–52 he was also a leader in senate attacks on the state department and U.S. foreign policy. George was particularly critical of additional appropriations for foreign military and economic assistance, declaring in Aug. 1951 that if European nations "can't stand on their own feet now, there is no use . . . thinking they will do it later."

At the Democratic national convention at Chicago in July 1952, George made the nominating speech for Sen. Richard Russell, his colleague in the senate and one of the leading Democratic candidates in the preconvention race.

orgia. Georgia, popularly known as the "empire state of the south," is located in the south Atlantic region of the United States. It has an area of 58,876 sq.mi. and had a 1950 population of 3,444,578. Of the population, 54.7% was rural and 45.3% urban; 68.6% was native white and 30.9% Negro. The chief cities and their 1950 populations were: Atlanta, the capital, 331,314; Savannah, 119,638; Columbus, 79,111; Augusta, 71,508; and Macon, 70,252.

History.—The general assembly was in session from Jan. 14 to Feb. 12, 1952. It enacted a law providing that in the 1952 election the names of presidential electors should appear on the ballot under a party heading only, without the names of nominees for president and vice-president. Another enactment provided for assistance to totally disabled persons under the federal social security program. Congress was petitioned to call a convention to amend the United States constitution by placing a limit of 25% on federal income, inheritance and gift taxes. Defeated in the November election was a state constitutional amendment requiring all parties to nominate candidates for statewide offices in a primary election based on county-unit votes rather than on popular votes. The following constitutional amendments were ratified: (1) the requirement that there be appropriated for highway purposes each year an amount not less than the total revenues from motor fuel and vehicle licence taxes collected during the preceding fiscal year; (2) the withdrawal of the state from the ad valorem tax field except to the extent of one-fourth mill for regulatory purposes; and (3) the provision that amendments affecting only a county or municipality be ratified or rejected only by the voters of the local unit. On Jan. 1, 1952, Atlanta annexed an area which made it three times its former size and which increased its population by about 100,000.

Principal state officials during the year were: governor, Herman E. Talmadge; lieutenant governor, S. Marvin Griffin; secretary of state, Ben W. Fortson, Jr.; comptroller general, Zach Cravey; attorney general, Eugene Cook; treasurer, George Hamilton; commissioner of agriculture, Tom Linder; commissioner of labour, Ben T. Huiet; and superintendent of schools, M. D. Collins.

Education.—During the school year 1951-52, there were 3,290 public schools in Georgia with an enrolment of 806,243 pupils and a teaching force of 25,642, according to the state department of education. Per capita expenditures by the state were \$171.49 for white children and \$108 for Negro children. There were 2,008 elementary schools (815 for white children and 1,193 for Negro children) with an enrolment of 618,906 (400,794 white children and 218,112 Negro children) and 17,651 teachers (11,678 white and 5,973 Negro). There were 1,282 high schools (720 for white children and 562 for Negro children) with an enrolment of 187,337 (141,578 white and 45,759 Negro children) and 7,991 teachers (6,103 white and 1,888 Negro).

During the fall quarter of 1952, the 15 units of the state university system had an enrolment of 16,880 regular students and 6,173 part-time or irregular students. Of the regular students, 1,887 were enrolled in 3 state Negro colleges. Total expenditures of the state government for education during the year ending June 30, 1952, were \$103,411,393, compared with \$60,000 the preceding year.

Public Insurance and Assistance, Public Welfare and Related Programs.—Public assistance programs during the fiscal year ending June 30, 1952, amounted to \$47,157,020, an increase of approximately 19% over the previous year, according to the state department of public welfare. Age assistance amounted to \$33,873,829; aid to the blind, \$1,198,500; and aid to dependent children, \$12,084,997.50. In June 1952, a total of 95,271 persons received old-age assistance with an average allowance of \$31.25 (compared with 101,684 persons in June 1951, with an average allowance of \$24.17); 2,973 blind persons received benefits averaging \$36.25 (compared with 2,868 persons in June 1951, receiving benefits averaging \$28.99); and 47,131 dependent children received benefits averaging \$19.95 (compared with 49,113 children in June 1951, receiving benefits averaging \$18.24). The United States bureau of labour statistics reported 14,700 persons receiving unemployment compensation in June 1952, under the Georgia law, compared with 15,500 in June 1951. In June 30, 1952, there were 6,417 prisoners in the state and county institutions under the control of the state board of corrections. Get allotments to this board for the fiscal year were \$1,314,348. There was an average of 584 boys and girls in state training schools during the 1951-52 fiscal year.

Communications.—As of June 30, 1952, the state highway department reported that there were 91,739 mi. of public roads in Georgia and an estimated additional 5,200 mi. of city streets and alleys. The state highway system extended 15,229 mi., and county roads extended 76,510 mi. For the fiscal year ending June 30, 1952, the state highway department expended \$49,165,358.

On Dec. 31, 1951, there were 6,021 mi. of railroads in Georgia, according to the Interstate Commerce Commission. The Georgia Public Service commission reported that there were 656,611 telephone stations in the state as of July 31, 1952. There were 1,808 mi. of federal airways in Georgia on September 30, 1952, according to the Civil Aeronautics administration, and 110 airports.

Banking and Finance.—On June 30, 1952, there were 403 banks in Georgia (51 national and 352 state) with deposits of \$1,958,197,000 and total resources of \$2,128,088,000, according to the Federal Deposit Insurance Corporation. This included savings and loan associations which accepted deposits.

The Georgia Savings and Loan league reported that there were 72 savings and loan associations on June 30, 1952, of which 60 were chartered by the federal government and 12 by the state. These 72 associations had resources of approximately \$340,000,000.

Total receipts of the state government for the fiscal year ending June 30, 1952, were \$228,876,799; budget allotments for the period were \$217,110,506. On June 30, 1952, the state had a net surplus of \$30,214,585.

Agriculture.—The U.S. department of agriculture reported that the cash income of Georgia farmers for 1951 was \$627,477,000, an increase of 18.7% over the income for 1950 and 55.6% above the ten-year average of 1941-50. Livestock and livestock products accounted for 38.1% of the cash income.

The state forestry commission estimated the total raw value at the mill of forest products harvested in Georgia in 1950 to be \$167,021,734.

Table I.—Principal Crops of Georgia

Crop	Estimated 1952	1951	Average 1941-50
Cotton, bales	720,000	931,000	686,000
Corn, bu.	36,674,000	49,536,000	44,673,000
Peanuts, lb.	402,000,000	595,800,000	698,300,000
Tobacco, lb.	125,620,000	137,361,000	92,991,000
Potatoes (sweet), bu.	1,960,000	1,625,000	5,781,000
Hay, tons	528,000	610,000	731,000
Oats, bu.	14,688,000	10,296,000	13,509,000
Wheat, bu.	2,318,000	1,794,000	2,162,000
Peaches, bu.	2,496,000	3,975,000	4,114,000
Pecans, lb.	40,300,000	51,500,000	29,443,000
Potatoes, Irish, bu.	456,000	483,000	1,217,000
Lespedeza (seed), lb.	5,700,000	6,400,000	9,270,000

Manufacturing.—The U.S. bureau of labour statistics estimated that there were 301,200 persons employed in manufacturing in Georgia in June 1952, compared with 300,400 in June 1951. Salaries and wages received by persons employed in manufacturing in Georgia in 1950 amounted to \$638,809,000. A value of \$1,227,442,000 was added by

Table II.—Principal Industries of Georgia

Industry	Value added by manufacture		
	1950	1949	1947
Textile mill products	424,356,000	314,589,000	398,023,000
Food and kindred products	145,472,000	142,215,000	133,448,000
Lumber and products, except furniture	123,454,000	80,039,000	88,466,000
Paper and allied products	96,633,000	77,313,000	54,207,000
Chemicals and allied products	74,761,000	51,211,000	77,043,000
Stone, clay and glass products	34,045,000	28,272,000	26,651,000

manufacture in 1950 compared with \$1,001,242,000 in 1949 and \$1,015,999,000 in 1947. (M. W. H. C.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Georgia in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Georgia

Table III.—Mineral Production of Georgia, 1949-1950

Mineral	1949 (Short tons)		1950	
	Quantity	Value	Quantity	Value
Barite	50,000	\$ 465,000	?	?
Clays	1,983,000	16,653,000	2,325,000	\$20,938,000
Iron ore	256,000	693,000	226,000	677,000
Sand and gravel	984,000	758,000	1,212,000	937,000
Stone	4,156,000	8,428,000	6,145,000	11,917,000
Talc	49,000	580,000	71,000	774,000
Other minerals	7,931,000
Total		\$35,508,000		\$44,157,000

ranks second among the states in the production of bauxite and mica, and third in clays and barite, and stands 32nd in value of output, with 0.37% of the U.S. total.

German Literature. Studies of recent history and reflections of contemporary human experience took the foreground among the 1952 publications. A slow

process was gaining ground toward reaching conclusive judgments about the crisis of the modern world and, especially, about the German aspects of war, revolution and dictatorship.

Toward this end, two comprehensive analyses of World War II were written by officers of the former German general staff. Kurt von Tippelskirch, in *Geschichte des Zweiten Weltkriegs* (Athenäumverlag, Bonn) presented the history of the war in the style of a precise report, which, nonetheless, permitted insight into the personal engagement and the responsible criticism of a highly qualified expert. Walter Görnitz' *Der Zweite Weltkrieg* (Steingrübenverlag, Stuttgart, 2 vol.) was the work of an equally objective historian, but it was more passionately written and considered more deeply the political preconditions of the war. These authors concurred in their documented condemnation of Adolf Hitler's fateful interference with strategy and left no doubt about their rejection of his political system.

Legislation concerned with Germany's contribution to western defense formed the centre of political discussions during the year. The documents concerning it were ably edited by the Institut für Staatslehre und Politik of the University of Mainz in *Der Kampf um den Wehrbeitrag* (Isarverlag, Munich). The debate about the question of which type of soldier should be the aim of future military education in Germany was intelligently stimulated by Werner Picht's *Vom Wesen des Krieges* (Vorwerk Verlag, Stuttgart) which dealt with the transformations demanded of the military by modern society, warfare and ethics. Experts joined in composing *Europa und die Deutschen Flüchtlinge* (Institut für Öffentliche Angelegenheiten, Frankfurt), a book of essays and documents concerning the social, psychological and economic problems of reintegrating the German expellees into the western world.

Books revealing moral and intellectual success in evaluating personal experience were leading the efforts at taking a new fundamental orientation. An outstanding contribution was the report of Hans Gollwitzer, *Und Führen wohin Du nicht willst* (Kaiser Verlag, Munich). This Protestant minister related his experiences as a prisoner of war in the U.S.S.R., from which he returned only in 1950. Together with Dietrich Bonhoeffer's religious and ethical thought in *Besinnung* (Kaiser Verlag, Munich), it was the most constructive Protestant contribution of the year's literature. Among German Catholic writers, Romano Guardini, in his academic speech *Verantwortung* (Koesel Verlag, Munich), took up the problem of German anti-Semitism as a continuing challenge to the courage of facing the truth and of taking responsibility. Giselher Wirsing, in *Schritt aus dem Nichts* (Diederichs, Düsseldorf), presented a diagnosis of the time, which revealed a serious reckoning with the past. The situation of Germany in world affairs was briefly but intelligently discussed by Wilhelm Wolfgang Schütz, the former London correspondent of the *Neue Züricher Zeitung*, in *Deutschland am Rande Zweier Welten* (Deutsche Verlagsanstalt, Stuttgart).

The autobiographical element prevailed even among achievements of literary merit. Peter Bamm, a surgeon, turned his report about a unit of the medical corps into brilliant and convincing literature setting forth the idea of humanity and the meaning of the service to it (*Die Unsichtbare Flagge*, Koesel Verlag, Munich). Werner Bergengruen's novel *Der Letzte Rittmeister* (Nymphenburger Verlagshandlung, Munich) was the sensitive and thoughtful portrait of the noble soldier of a bygone era. As in his novel on the power of powerless men, *Die Macht der Ohnmächtigen* (Hegner, Cologne), Edzard Schaper, in his new book *Hinter den Linien*, contrasted, with the support of personal experience, man's religious capabilities and the forces unleashed and controlled by oppression and terror. Gertrud von LeFort supplemented her literary work with a collection of autobiographical and critical essays, *Aufzeichnungen und Erin-*

nerungen (Benziger, Cologne). Leonhard Frank published an autobiographical novel, *Links wo das Herz ist* (Nymphenburger Verlagshandlung, Munich), the epilogue of a half century of revolutionary passion, hope and deception, presented with simplicity and with an almost ironical Biedermeier touch. Karl Kraus, the eminent Viennese critic, never published himself what, in 1933, he wrote about the third reich, with the exception of the one sentence "Nothing comes to my mind about Hitler." The book explaining this satirical statement came out during 1952 under the title *Die Dritte Walpurgisnacht* (Koesel Verlag, Munich).

Philosophic thought was still dominated by the contrast between the positions of Martin Heidegger and Nicolai Hartmann. The latter's work was brought to completion by the publication of his book on teleological thought, *Teleologisches Denken* (de Gruyter, Berlin), a critical analysis of metaphysics. A Catholic priest, Gustav A. Wetter, contributed an indispensable history of the intellectual bases of soviet policy, *Der Dialektische Materialismus* (Herder, Freiburg). The minutely documented work traced the development of soviet thought to 1951 and ended with a thorough and, in some points, surprising comparison of Thomism and dialectic materialism. On the borderline between philosophy, psychiatry and sociology, the neurologist Wilhelm Küttemeyer presented a cultural diagnosis of present-day Europe, *Die Krankheit Europas* (Suhrkamp, Frankfurt). This concern about the critical state of modern man and society was most evident from the discussions about the role of art in the modern world. It was in this spirit of the consciousness of crisis that the art historian G. F. Hartlaub probed into the domain of magic and superstition in a book of essays, *Das Unerklärliche* (Koehler, Stuttgart). The republication of Ernst von Lasaulx, *Philosophie der Geschichte* (Oldenbourg, Munich) made accessible the book, in response to which Jacob Burckhardt conceived his criticism of culture in *Force and Freedom*.

The interest in Hugo von Hofmannsthal was supported by the continued publication of his collected works (Fischer, Frankfurt), that in Rudolf Borchardt by a volume of essays *Villa* (Suhrkamp, Frankfurt) and a selection of poetry (Bennigsen, Schwabe, Basle). The complete edition of the letters exchanged between Richard Strauss and Hugo von Hofmannsthal, *Briefwechsel* (Atlantis, Zürich) gave a valuable understanding of the modern theatre and was also a testimony of the unique relationship between an outstanding composer and a great poet. Hofmannsthal's scenario for the Strauss opera, *Danae* (Fischer, Frankfurt), was published simultaneously with the performance of the opera at the Salzburg festivals. Hofmannsthal's concept of the plot had been the source of inspiration for Wolf von Niebelschütz in his novel *Der Blaue Kammerherr* (Suhrkamp, Frankfurt), a work of *poésie pure*, which, written with brilliant sophistication, reflected through the ironical distance of rococo society and mythological play the human concern in a world of disorder, ambition and self-delusion. The lyrical poems of Karl Krolow, *Die Zeichen der Welt* (Deutsche Verlagsanstalt, Stuttgart), gave evidence of a genuine talent. Hans Egge Holthusen pursued the road of T. S. Eliot in his new book of verse *Labyrinthische Jahre* (Piper, Munich). Friedrich Georg Jünger published a book of prosody, *Rhythmus und Sprache im deutschen Gedicht* (Klett, Stuttgart), in which he re-examined constructively the problems of the lyrical form. The same author proved himself a master of a simple and transparent narrative prose by a book of short stories, *Die Pfauen* (Hanser Verlag, Munich). Ernst Wilhelm Eschmann's *Alkestis* (Heliopolis Verlag, Tübingen) revealed its author as a dramatist in his own right, who was able to integrate modern experience and language with the classical topic. Two newcomers among novelists deserve serious attention: the Swiss Elisabeth Aman, who

came out with a novel, *Das Vermächtnis*, and a short story, *Manuel und das Mädchen* (Hermann Rinn, Munich), and George Munk because of his novel *Am Lebendigen Wasser* (Inselverlag, Wiesbaden). Both of these authors combined the best heritage of German prose with a thoughtful awareness of the predicaments of 20th-century man.

In literary scholarship Friedrich Sengle presented a comprehensive re-evaluation of *Wieland* (Metzler, Stuttgart), which he followed up with a criticism of the German historical drama, *Das Deutsche Geschichtsdrama* (Metzler, Stuttgart). The history of German literature from the origins to the present was treated by a co-operative work, *Annalen der Deutschen Literatur* (Metzler, Stuttgart), edited by Heinz Otto Burger and supplemented by comparative chronological tables. Theodor W. Adorno's *Versuch über Wagner* (Suhrkamp, Frankfurt) was a criticism significant beyond its subject, the historical position of Richard Wagner, because of its way of approach, which combined musicological and literary interpretation with modern Hegelian dialectic. The boundaries between established disciplines were broken in a different way, although not less successfully, by the art historian Hubert Schrade in *Götter und Menschen Homers* (Kohlhammer, Stuttgart). Otto H. Förster offered in *Entfaltung und Zerfall* (Seemann, Cologne) a cultural interpretation of German art. It was a constructive contribution to the debate which Sedlmayr's *Verlust der Mitte* had started out and it indicated possibilities of overcoming historical relativism by an intelligently comprehensive approach to the historical subject. In his *Humanitas* (Glock und Lutz, Nuremberg) Erich Przywara presented an embracing and thorough criticism of the humanistic movements of thought which shaped the 20th-century German mind. *Literaturmetaphysik* and *Die Plakatwelt* (Deutsche Verlagsanstalt, Stuttgart), Max Bense's essays on literary criticism and modern literary problems, took issue, from the viewpoint of an existentialist philosopher, with the transformation of thought and letters in modern technological society.

The Hamburg edition of Goethe, *Goethes Werke* (Christian Wegner, Hamburg, 14 vol.) was almost completed. Edited by Erich Trunz, it was distinguished by the inclusion of excellent comments, of well selected bibliographies, and of Goethe's own statements about his works. Josef Nadler's edition of *Hamanns Werke* (Herder, Vienna), of which three of six volumes were published, made available hitherto unknown writings. Hermann Hesse, *Gesammelte Dichtungen* (Suhrkamp, Frankfurt) included all of the author's literary work to 1950.

A broad scholarly undertaking, *Orbis Academicus* (Karl Alber Verlag, Freiburg), was devoted to the history of the problems of knowledge. They were presented by documents with interconnecting analyses. The organization of the series was guided by the aim of furthering interdisciplinary connections, general education and competent scholarly progress. The volumes published included *Geschichtswissenschaft* by Fritz Wagner, *Soziologie* by Helmut Schoeck, *Evolution* by Walter Zimmermann and *Die Ostkirche* by Ernst Benz. To the historian of art and culture, the *Reallexikon der Deutschen Kunstgeschichte* (Metzler, Stuttgart) offered an encyclopaedic source of information which was reliable and stimulating. A new edition of Brockhaus encyclopaedia, *Der Grosse Brockhaus* (Wiesbaden), started out with volume 1 in 1952.

Germany. A country of central Europe, Germany is bounded north by the North sea, Denmark and the Baltic sea, east by Poland, south by Czechoslovakia, Austria and Switzerland and west by France, Luxembourg, Belgium and the Netherlands. From 1949 Germany was partitioned into two states with a special provisional regime for Berlin (q.v.). Areas

REBUILDING IN GERMANY continued at an active rate in 1952, with industrial architecture showing U.S. influences. Above, the new administration building of an electric power company in a Frankfurt suburb

and populations of the two states and Berlin are as shown in the table.

	Area (sq.mi.)	Population (1939 census)*	(1950 census)*
German Federal Republic	94,738	39,350,121	47,695,672
German Democratic Republic	41,379	15,157,123	17,313,734†
Berlin	344	4,338,756	3,336,475
Total	136,461	58,846,000	68,345,881§

*Within the 1945 boundaries. †Excluding the Saar (q.v.) ‡1946 census. §1951 est.: 70,000,000.

Language: German, with small admixture of Lusatian (260,000 in the Kottbus-Bautzen area), Polish (150,000, mainly in Westphalia) and Danish (120,000). Religion: (1938 est.) Protestant 62.7%, Roman Catholic 32.5%, Jewish 0.7%, other 4.1%; (1950 census, Federal Republic only) Protestant 50.7%, Roman Catholic 45.2%.

German Federal Republic.—Chief cities (with population of more than 200,000, 1950 census): Bonn (cap. 115,394); Hamburg (1,605,606); Munich (831,937); Essen (605,411); Cologne (594,941); Frankfurt-on-Main (532,037); Dortmund (507,349); Düsseldorf (500,516); Stuttgart (497,677); Bremen (444,549); Hanover (444,296); Duisburg (410,783); Wuppertal (363,224); Nuremberg (362,459); Gelsenkirchen (315,460); Bochum (289,804); Kiel (254,449); Mannheim (245,634); Lübeck (238,276); Brunswick (223,760); Wiesbaden (220,741); Oberhausen (202,808). President of the republic, Theodor Heuss; federal chancellor, Konrad Adenauer (q.v.). Allied high commissioners in 1952: British, Sir Ivone Kirkpatrick; French, André François-Poncet; U.S., John J. McCloy and (from Aug. 1) Walter J. Donnelly.

German Democratic Republic.—Capital, Berlin-Pankow. Chief cities (1946 census): Leipzig (607,655); Dresden (467,966); Chemnitz (250,188); Magdeburg (236,326); Halle (222,505). President of the republic, Wilhelm Pieck; premier, Otto Grotewohl. Chairman of the Soviet Control commission in 1952, Army Gen. Vasili Ivanovich Chuikov.

History.—During 1952, in spite of much propaganda, ex-

changes of notes between the western powers and the U.S.S.R., and proposals and counterproposals from Democratic and Federal Germany, the possibility of reunification of Germany seemed to have receded.

The Exchange of Notes.—On March 10 the Soviet government sent identical notes to the U.S., British and French governments urging immediate four-power talks to draw up a draft peace treaty with Germany. The notes outlined the principles upon which a peace treaty with Germany should be based. The most important terms were: (1) Germany should be restored as a single, independent, peace-loving state with its eastern frontier on the Oder-Neisse line; (2) Germany should undertake not to enter into any coalitions or military alliances; (3) Germany should be permitted to have its national armed forces (land, air and naval) necessary for the country's defense.

The three western governments, after consultation with the German Federal government, replied on March 25. They insisted that the conclusion of a peace treaty with a reunited Germany required the formation of an all-German government expressing the will of the German people; such a government could "only be set up on the basis of free elections in the Federal Republic, the Soviet zone and Berlin"; such elections could be held only in circumstances which safeguarded the national and individual liberties of the German people. In order to ascertain whether the first essential conditions existed, a U.N. commission had been appointed to carry out a simultaneous investigation in the Federal Republic and in the Soviet zone; the three western governments would be glad to learn what facilities were afforded in the Soviet zone to enable the commission to carry out its task.

On April 10 the Soviet government rejected the proposal that the U.N. commission should verify the existence of conditions for the holding of all-German elections; it proposed instead that the question of all-German elections should be studied by a commission consisting of representatives of the four occupying powers.

On May 13 the three western powers declared that they were ready to begin negotiations on German unity, the election of a free all-German government and the conclusion of a peace treaty with that government when understanding had been reached on the scope of the negotiations and the fundamental problems to be examined. The three governments insisted on the necessity of

holding free elections in all parts of Germany and again asked the Soviet government to make practical and precise proposals for an impartial commission of investigation.

On May 25, on the eve of the signature of a series of contractual agreements between the three western powers and the German Federal government, the Soviet government, ignoring the main point of the Allied notes of March 25 and May 13, presented a lengthy denunciation of the contractual arrangements to be signed at Bonn, describing them as paving the way for the restoration of "aggressive western German militarism" and drawing the German people "into the preparation of a new war." However, the Soviet government again proposed an immediate four-power meeting on the German question.

On July 10 the three western powers proposed that there should be an early meeting of representatives of the four governments, but only to discuss the first step toward the ultimate formation of an all-German government; viz., the appointment of an impartial commission, not subject to veto or control by the four powers, to determine whether conditions for free elections existed.

On Aug. 23 the Soviet government asked for a four-power conference to be called "not later than October" to discuss (1) the preparation of a German peace treaty; (2) the formation of an all-German government; (3) the holding of all-German elections; (4) the time limit for the withdrawal of occupation forces from Germany.

On Sept. 23 the western powers insisted on the need for free all-German elections before the negotiation of a peace settlement and formation of an all-German government. The reply renewed the proposal for an early four-power meeting "to discuss the composition, functions and authority of an impartial commission of investigation with a view to creating the conditions necessary for free elections."

On Sept. 19 a deputation of five members from the *Volkskammer* presented to Hermann Ehlers, speaker of the *bundestag*, the Democratic Republic's newest proposals, a joint commission with equal representation from both republics, which should prepare plans for reunification, and an agenda for the future peace treaty conference on Germany. The deputation, which received a hostile reception from the public in Bonn, was allowed to remain only 48 hours in the Federal Republic and was told that the *bundestag* reply would be delivered later.

German Federal Republic.—Between the western democracies and the Federal Republic, great progress toward closer understanding was made during 1952. The general contract, signed at Bonn on May 26, and the agreement on German participation in the European Defense Community (E.D.C.), signed the following day in Paris, when ratified would make the Federal Republic an equal partner in the western world and enable it to contribute to the defense of freedom.

Ratification of the general contract and the E.D.C. agreement was strongly opposed by the Social Democrats, who at their annual congress at Dortmund (Sept. 24-28) declared that they would seek revision of these treaties if they came to power; they stressed that reunification of Germany should be the first aim of the Federal Republic's foreign policy.

Through the European Coal and Steel Community, in force from July 25, Allied restrictions on German heavy industry were removed and the International Ruhr authority ceased to function. As to the participation of the Federal Republic in European defense, details as to the size and equipment of a future German contingent were settled by the North Atlantic Treaty organization (NATO) council at Lisbon on Feb. 26: the Federal Republic was granted 12 divisions for defense.

The future status of the Saar played an important role in both the international and internal discussions. Whether that

"HERR DOCTOR, doesn't this picture please you?" a 1952 cartoon which appeared in the *Vrij Nederland* (Amsterdam)

territory was to retain its existing status until a peace treaty as signed, or be returned to Germany or be "Europeanized" as still to be settled. (See SAAR.)

In the financial field, the London conference on German debts ended (Aug. 8) with the Federal Republic agreeing to pay 4,300,000,000 DM. (6,000,000,000 DM. prewar obligations, 1,500,000,000 DM. interest charges and 6,800,000,000 DM. postwar debts). Settlement was hailed in western Germany as a significant advance toward the Federal Republic re-entering the international money market and as freeing the way for much-needed international loans for industry.

Elections for the new southwest state (*Land*) of Württemberg-Baden (March 9) resulted in a government of Socialists (S.P.D.), Free Democrats or Liberals (D.V.P.) and Refugee Party (B.H.E.), even though the Christian Democratic Union (C.D.U.) was the leading single party (34% of votes). Reinhold Meier became premier, and by this arrangement of parties the federal government coalition lost its majority in the *bundesrat* or federal senate. Elections in Hesse (May 4) increased the Social Democratic hold over that state.

After a seven-day debate, the *Lastenausgleich* (sharing burdens of war and postwar losses) legislation was passed on May 6. Proceeds of a levy on personal property, shares or other assets would be used to compensate persons who had lost possessions during and after World War II. The levy would be paid over a period of 30 years and was calculated to yield about 1,150,000,000 DM. annually. Total claims exceeded 60,000,000,000 DM.

Another much-debated law, the *Betriebsverfassungsgesetz*, which established works councils and regulated the participation of workers' representatives on controlling boards of certain basic industries (coal, iron and steel) was approved by the *bundestag* by 195 to 140 votes (July 19).

The biggest event in the political field was the death of Kurt Schumacher, chairman of the S.P.D. His successor, Erich Ollenhauer, was elected at the party conference at Dortmund by 357 out of 363 votes.

The neo-Nazi S.R.P. (Sozialistische Reichspartei) dissolved itself (Sept. 12) following interminable internal bickerings and after the federal government a few months earlier had petitioned the supreme court to declare it illegal. Whether the S.R.P. had disbanded or merely gone underground was uncertain.

Alcide de Gasperi, premier and foreign minister of Italy, officially visited Bonn as guest of the federal government (Sept. 21-23).

Economically the year registered great advances. Following the coming into force of the European Coal and Steel Community, nearly all restrictions on Ruhr production ceased to operate, though the International Ruhr authority would not be dissolved until Feb. 10, 1953. For the first nine months of the year, German coal production totalled 91,640,000 tons (88,350,000 tons in the same period of 1951). In July steel production was 1,378,000 tons, the highest since 1938. It was expected that steel production in 1954 would exceed that of 1937 (17,800,000 tons).

The breakup of the industrial cartels, according to the Allied High commission law No. 27 (May 1950), was almost completed. The Krupp combine, for instance, which after losses through bombing and dismantling was estimated to have a value of 297,000,000 DM., was decentralized into a number of separate projects. The present owner, Alfred Krupp, was awarded £30,000,000 compensation for losses of property and would also retain holdings in many enterprises. By 1952 the German mark had become one of the "hardest" currencies, as a result of increased production, foreign trade balance, European Recovery program aid and hard work. In the European Payments union,

FRENCH FOREIGN MINISTER Robert Schuman speaking at Bonn, Ger., where a contract was drawn up in May 1952 amounting to a virtual war settlement between west Germany and the three major Allied powers, England, France and the U.S.

the Federal Republic was in August a leading creditor with a surplus of \$405,800,000. Since 1945 the government had spent 28,000,000,000 DM. in aiding refugees and homeless persons.

German Democratic Republic.—The Soviet-occupied zone of Germany became more isolated from western influences during 1952, making it increasingly difficult to obtain reliable information regarding developments there, especially as most of the official reports were propaganda. At the same time, however, great efforts were being made to persuade the Federal Republic to reject U.S. policy, which, it was said, would annihilate Germany, and accept "German" policy, which would save it.

Relations between the German Democratic government and the eastern bloc of states controlled from Moscow continued to become closer. Klement Gottwald, president of Czechoslovakia, revisited Wilhelm Pieck, president of the German Democratic Republic (March 10-12).

During May the Democratic Republic announced several measures which aimed to secure greater isolation from the west. Interzonal permits were from May 17 to be issued only by the *Volkspolizei*, zonal borders were to be more rigidly controlled because of "spies" and "saboteurs," and entry of west Germans and west Berliners into the Soviet zone was to be regulated by

INCREASED NUMBER OF GERMAN ships anchored at Heligoland after that North sea island was returned to west German sovereignty March 1, 1952. Heligoland had been used as an R.A.F. practice bombing target since World War II (note the rubble at left)

a new special pass. Telephone communications between west and east Berlin were cut on May 27, and a no man's land of 3.1 mi. was created along the whole extent of the western frontier of the German Democratic Republic.

The formation of a German people's army had been proceeding for some time, but an excuse for speeding up the process came when it was obvious that the general contract and the E.D.C. agreement between the Federal Republic and the western powers would be concluded. On May 1 Pieck announced the creation of a defense force if the Bonn agreement was signed; on June 18 the *volkskammer* approved a resolution for the establishment of a national army; on Sept. 16 it was officially announced that recruitment started. Because of lack of success, the ministry of the interior ordered on Sept. 26 that from each *Kreis* (district) 5% of the population must join the new force. It was expected that by the end of 1952 the Democratic Republic would have 12 divisions totalling 180,000 men, and double that number by 1954. One of the results of these new measures was that from July to September 43,200 Germans escaped to west Berlin and the Federal Republic.

A labour service under the title "Service for Germany" was approved on July 24 for 17-year-old youths of both sexes. They would receive uniforms, food and lodging and 1 OM. a day as pocket money.

A Soviet system of administration was introduced into the Democratic Republic on July 23 when instead of the former five *Länder* (states) there were created 14 new *Bezirke* (provinces), each containing 15 to 16 *Kreise* (districts). The new move was intended to remove historical divisions and to give more power to Communist officials.

The policy of sovietization, which continued in both industry

and agriculture, had also been applied most determinedly in cultural matters. Simultaneously, the negative side of this policy (viz., exclusion of all western cultural influences) was carried still further. In August permits were refused for 5,000 east German Protestant clergy and laymen to attend the World Lutheran congress at Hanover. A special synod of the Evangelical Church met in east Berlin (Aug. 12) to discuss the abnormal situation, which included the German Democratic authorities' refusal to allow theological students trained in western institutions to hold pastorates in eastern Germany, plans to close theological faculties in eastern universities and the withholding of financial grants to churches on the least excuse.

Revision of the whole system of justice, particularly of the criminal law, announced in October, brought the Democratic Republic into line in matters of justice with the system applied in the U.S.S.R. Henceforth, any judge could be dismissed by the ministry of justice, and decisions by individual judges would be replaced by collective judgments.

On Feb. 8 the *volkskammer* approved the economic plan for 1952, whereby industrial production would be increased by 13.7% over the previous year; in agriculture production was to be increased by 10%. Employment in industry would increase by 154,000. The report on 1951 production stated that the plan was not everywhere fulfilled, and that there was a lack of raw materials and of electricity supplies.

According to reports of the ministry for all-German affairs in the Federal Republic, the U.S.S.R. took from current production in the Democratic Republic reparations to the value of 2,500,000,000 OM. (1 DM.=4.7 OM.)

In the prisons and concentration camps of the Democratic Republic there were about 200,000 Germans, according to estimates published at Bonn on Sept. 26. (See also EUROPEAN UNION; ISRAEL; NORTH ATLANTIC TREATY ORGANIZATION; REFUGEES; UNION OF SOVIET SOCIALIST REPUBLICS.) (J. E. WI.)

Education.—*German Federal Republic.*—Schools (May 1950): elementary 28,779, pupils 6,314,452, teachers 130,618; higher elementary 579, pupils 196,067, teachers 6,011; secondary 1,488, pupils 620,481, teachers 28,872; universities 16, students 74,258, professors and lecturers 3,450; Roman Catholic theological and philosophical faculties 12, students 3,400; technical colleges 7, students 22,810. The Free university in western Berlin had 2,000 students in 1951.

German Democratic Republic.—Universities 5, students (1948) 12,269, teaching staff 671. In addition there was the University of Berlin with in 1948, 5,634 students and 157 professors and lecturers.

Finance and Banking.—*German Federal Republic.*—Budget (1951—est.) revenue 17,738,000,000 DM., expenditure 18,357,000,000 DM. National income (1951) 90,100,000,000 DM. Bank deposits (May 1952) 9,430,000,000 DM. Currency circulation (June 1952) 9,440,000,000 DM. Monetary unit: deutschemark; official exchange rate (Nov. 1951): £1=11.76 DM.; U.S. \$1=4.20 DM.

German Democratic Republic.—Budget (1950 est.) balanced at 13,500,000,000 OM.; (1951 est.) revenue 21,751,000,000 OM., expenditure 25,488,000,000 OM. Currency circulation (Dec. 1951) 3,331,000,000 OM. Although theoretically at par with the western mark, the free exchange rate in Berlin was (Nov. 1952): 1 DM.=4.70 OM.

Foreign Trade.—*German Federal Republic.*—(1951) Imports 14,678,000,000 DM.; exports 14,536,000,000 DM. Main sources of imports (1951): U.S. 18%; the Netherlands 7%; France 5%; Sweden 5%; U.K. 3%. Main destination of exports (1951): the Netherlands 10%; France 8%; Belgium-Luxembourg 7%; Sweden 7%; U.S. 7%; Switzerland 6%; U.K. 6%. Main imports (1951): cereals 12%; raw cotton 8%; coal and gasoline 7%. Main exports (1951): machinery and vehicles 27%; coal and coke 11%.

German Democratic Republic.—Imports and exports were together estimated at 700,000,000 OM. in 1949 and 1,200,000,000 OM. in 1951. Nine-tenths of exports were taken by the Soviet Union and the people's democracies (Soviet Union 50%; Poland 23%; Czechoslovakia 10%); 85% of imports were supplied by the U.S.S.R. and its satellites.

Transport and Communications.—Railways (Dec. 1951): *German Federal Republic* 19,086 mi.; *German Democratic Republic* 8,942 mi. Railway traffic (*German Federal Republic*, monthly average, 1951): passengers 1,490,400,000; freight ton-miles 2,850,000,000; freight carried 21,440,000 tons. Roads (Dec. 1950): *German Federal Republic* 79,250 mi. including 1,333 mi. of Autobahn; *German Democratic Republic* 3,093 mi. Motor vehicles licensed (*German Federal Republic*, Dec. 1950) 2,155,355, including 987,583 motorcycles. Shipping (July 1951) 1,037,711 gross registered tons. Cargo in western German ports in external trade (monthly average, June 1952): loaded 879,000 metric tons, unloaded 1,980,000 metric tons. Telephones (Jan. 1951): *German Federal Republic* 2,393,013; *German Democratic Republic* 332,200. Radio receiving sets (1950): *German Federal Republic*, 7,730,000.

Agriculture.—Main crops (metric tons): *German Federal Republic.*—Wheat (1951) 2,949,000; rye (1951) 3,034,000; barley (1952) 1,680,000; oats (1952) 2,600,000; potatoes (1952) 24,103,000. *German Democratic Republic.*—Wheat (1950) 815,000; rye (1950) 2,130,000; barley (1950) 515,000; oats, including mixed grains (1950) 1,140,000; potatoes (1951) 11,160,000. **Livestock:** *German Federal Republic.*—(1951) cattle 11,453,000; pigs 12,054,000; goats 1,347,000; sheep 2,048,000; horses 1,570,000; poultry 50,676,000; turkeys 416,000; geese 2,419,000; ducks 902,000. *German Democratic Republic.*—(1950) cattle 3,615,000; pigs 5,705,000; goats 1,644,000; sheep 1,085,000; horses 772,000; poultry 19,902,000.

Production.—(Metric tons): *German Federal Republic.*—(1951) milk 147,288,000 hl.; butter 276,000; meat 1,344,000; sugar, raw 1,059,000. *German Democratic Republic.*—Milk (1949) 2,358,000; butter (1949) 64,000; meat (1949) 419,000; sugar, raw (1950) 833,000, (1951) 771,000.

Industry.—*German Federal Republic.*—Persons employed (Sept. 1951) 14,884,500; unemployed (Aug. 1952) 1,107,000. Index of industrial production (1948=100), 182 in 1950, 218 in 1951 and 217 in July 1952. **Production** (metric tons, 1951): coal 118,920,000; lignite 83,124,000; electricity 51,360,000,000 kw.hr.; gas 10,752,000,000 cu.m.; crude oil 1,368,000; iron ore (25% metal) 12,924,000; pig iron 10,692,000; steel ingots and castings 13,500,000; copper 141,000; lead 77,000; zinc 141,000; aluminum 74,000; cement 12,204,000; building bricks, 4,608,000,000; motor cars 267,360; commercial vehicles 96,000; cotton yarn 324,000; woven cotton fabrics 217,000; wool yarn 92,000; rayon filament yarn 54,000; rayon staple fibre 128,000. *German Democratic Republic.*—Coal production (1951) c. 2,500,000 metric tons; crude steel, 1,548,000 tons; lignite, c. 100,000,000 tons.

G.I. Bill of Rights: see VETERANS ADMINISTRATION (U.S.).

Gibraltar. A British fortress colony. Gibraltar is situated on a peninsula from the southwest coast of Spain at the western entrance to the Mediterranean. Area: 2.12 sq.mi. (including reclamation). Population, excluding armed forces: (1951 census) 22,848. Language: Spanish (50% also speak English). Religion: mainly Roman Catholic. Governors (1952): Gen. Sir Kenneth Anderson and (from May 9) Lieut. Gen. Sir Gordon MacMillan.

History.—An income tax ordinance was enacted in April 1952 and the tax would be collected in 1953 for the first time. Economic conditions continued to be satisfactory, with an increase in the manufacture of tobacco and in the volume of shipping using the port. The Louto high school for girls was reopened in September after the interior of the building had been completely redesigned and modernized. A new junior school was also opened at Grand Parade. The 400-yr.-old King's chapel, the shrine of all the corps and regiments that took part in the capture and subsequent sieges of the rock, had been damaged by the explosion of the ammunition ship "Bedenham" in 1951. It had now been restored and was reopened by the new year, and in February the governor unveiled two new stained glass windows.

(K. G. B.)

Education.—Schools (Dec. 1951): primary and infant 18 (1,964 pupils), secondary 5 (1,127 pupils).

Finance and Trade.—Currency: pound sterling with local notes. Budget (1952 est.): revenue £879,127; expenditure £922,950. Foreign trade (1951): imports £6,150,000; exports £838,000.

Glands: see ENDOCRINOLOGY.

Glass. In 1952 the United States glass industry continued the prosperity of 1951, with no major changes in volume of the principal lines of manufacture. The value of products for the year was expected to reach at least \$1,250,000,000, of which approximately one-third was in bottles and containers, one-fourth in flat glass, and one-fourth in pressed and blown glassware, leaving one-sixth for all other items.

The greatest expansion during the year took place in the manufacture of fibre glass. The opening of patents to licence by the chief producer enabled a number of companies to enter this field. The applications of glass fibres to new uses went on at a remarkable rate. In fine fibres, glass has strength comparable

with that of steel. Therefore, when glass fibres are suitably bonded by other materials that prevent the scratching that destroys the strength of the glass, a number of products of tremendous strength and high utility can be developed. Body armour for soldiers, structural parts, boxes, twine and paper may be mentioned as examples.

Research on glass extended more and more into its fine structure. Attention was directed to the size, character and bonding relationships of its component atoms. Thus the specific properties of various compositions could be explained or predicted more surely and accurately than by the empirical study of oxide relationships, which was the method employed in former years.

The glass division of the American Ceramic society continued its growth and activity. Because of the large number of scientific papers, mainly from the glass division, the society established a basic science division, where researches of scientific rather than of direct technological interest were reported. Patents dealing with glass were issued at the usual steady rate.

International co-operation in glass research continued under the leadership of the International Commission for Glass, which held its annual meeting in London and Sheffield, Eng., during July.

European developments of interest centred upon electrical glassmelting, which had attained a high degree of success. Electric glass furnaces began to appear in the U.S. wherever hydro-electric power made the method economical. In other areas electric melting or heating was applied to special glasses. (See also CERAMIC PRODUCTS.)

(S. R. S.)

Gliding. Seventeen countries were represented at the World Soaring Championship contest at the Four Winds airport, Madrid, Sp., June 30 to July 13, 1952: Argentina, Australia, Belgium, Brazil, Canada, Denmark, England, Finland, France, Germany, the Netherlands, Italy, South Africa, Spain, Sweden, Switzerland and the United States. P. A. Wills of England, flying a Sky, won the title of world champion. Second place went to G. Pierre of France, flying a CM 8-15. Third place was earned by R. C. Forbes of England, flying a Sky.

In the United States, the 19th National Soaring contest was held at Grand Prairie, Tex., Aug. 12-30. Richard Johnson, flying the RJ 5, set a world speed record of 53.8 m.p.h. for a triangular course and also earned the title of national champion. William Coverdale established a new distance and return record of 268 mi. in a Schweizer 1-23 sailplane.

During the year several records were established. In France two world duration records were set: 53 hr. 4 min. in a CM-7 two-place sailplane by A. Carraz and G. Branswick on Feb. 4, and 56 hr. 15 min. in an Air-100 sailplane by C. Atger on April 2. In the United States, a new two-place altitude world record of 46,000 ft. and an altitude gain of 36,000 ft. was made by L. Edgar and H. Klieford on March 29 in a Pratt Read sailplane. A feminine world two-place distance record to a predetermined goal of about 172 mi. was set by B. Woodward and A. Saudek on July 11 in a Pratt Read sailplane.

An Australian national distance record of 259 mi. was set by K. Colyer on Dec. 25, 1951, in an Olympia sailplane, and a goal and return record of 126 mi. by M. Waghorn in an Olympia sailplane.

Several new sailplanes were designed and built during the year: in Poland a canard type sailplane, the I.S.-5 Kaczka, and a two-place sailplane, the SZD-9 Bocian; in France the Fauvel A.V. 36, a tailless sailplane; in Denmark a two-place sailplane, the Polyt III; and in Germany, the Spatz, a single-place sailplane for advanced soaring training flights.

A new source of atmospheric energy for soaring was revealed by Joachim Kuettner of the air force Cambridge Research cen-

tre in a paper entitled, "Soaring on Traveling Waves in the Jet Stream," given at the technical meetings of the Institute of Aeronautical Sciences. (B. Sk.)

Gold. The large net purchases of gold by the United States that characterized international gold movements from July 1951 through March 1952 had subsided by mid-1952, as appears from Table I. Furthermore, while the bulk of United States purchases from July 1951 through March 1952 came from the United Kingdom, the banker of the sterling area, those effected from April through June 1952 originated mainly in Latin America.

Largely as a result of these net gold purchases of foreign gold, the monetary gold stock of the United States increased from \$21,872,000,000 in June 1951 to \$23,533,000,000 in June 1952; it stood at \$23,526,000,000 in Sept. 1952. Other countries (excluding the U.S.S.R.) experienced an aggregate decline in their monetary gold stocks from \$12,400,000,000 in June 1951 to \$10,670,000,000 in June 1952. Including the gold holdings of the International Monetary fund, of the Bank for International Settlements and of the European Payments union, the world's monetary gold reserves (excluding the U.S.S.R.) amounted in June 1952 to \$36,130,000,000, as against \$35,930,000,000 a year previously. In June 1952 the United States held 65% of the world monetary gold stock, as against 61% in June 1951.

A comparison between the increase in the total official gold reserves of countries outside the U.S.S.R. and the volume of gold production in these countries indicates that \$235,000,000 worth of gold went into industrial uses or private hoards or was otherwise unaccounted for during the first half of 1952, as against nearly \$400,000,000 during the second half of 1951. Complementing this change, world monetary gold reserves (excluding the U.S.S.R.), which during the second half of 1951 increased by only \$20,000,000, the lowest increment for any postwar half-year period, went up by about \$180,000,000 between January and June 1952. Table II outlines these developments.

The slowing down in the disappearance of newly mined gold into private hoards in the first half of 1952 seemed to reflect principally a decline in demand, which in turn appeared to be largely attributable to an abatement of inflationary pressure in large parts of the world. Gold prices in terms of local currencies, especially those in the far east and continental western Europe, moved generally downward; the price at which gold was traded

directly for United States dollars in various markets outside the United States reportedly fell from \$39 per fine ounce in Jan. 1952 (it had stood at \$44 in Jan. 1951) to \$37 in April; from May through September 1952 it fluctuated around \$37.50.

See M. A. Kriz, "The Price of Gold," *Essays in International Finance*, No. 15 (July 1952).

World Production.—Table III shows the gold outputs of the major producing countries, as reported by the U.S. bureau of mines. World totals are uncertain, however, since only estimates were available for the U.S.S.R.

United States.—Domestic mine output declined in 1951 in all the important producing states, with the year's total 18% less than that of 1950. The decline continued into 1952, the total for the first seven months of the year being 1,020,614 oz. or 12% less than in the corresponding period of 1951.

Canada.—Gold production in Canada declined slightly in 1951, to 4,328,931 oz., against 4,448,396 oz. in 1950.

Union of South Africa.—There had been only minor fluctuations in the gold output of South Africa in the post-World War II years; small declines were reported, from 11,663,713 oz. in 1950 to 11,516,450 oz. in 1951 and 5,831,976 oz. in the first half of 1952. (See also EXCHANGE CONTROL AND EXCHANGE RATES, MINERAL AND METAL PRODUCTION AND PRICES.) (G. A. Ro.)

Gold Coast: see BRITISH WEST AFRICA.

Golf. The golfing year of 1952 began with the newly adopted rules for the game going into effect on Jan. 1. The code had previously been agreed upon by representatives of the United States Golf association and the Royal and Ancient club of St. Andrews, Scot., with a view toward standardizing regulations for world-wide observance. The stymie was relegated to oblivion by this move, along with other changes.

In international competition for the Curtis cup, the biennial contests between women golfers of the United States and Great Britain, the British side won for the first time since the cup was offered in 1932, by 5 and 4, at Muirfield, Scot. The American remained to play in the women's British championship at Troon, but Moira Paterson of Glasgow won this title when she defeated Frances Stephens of Liverpool, 1 up, 38 holes, in the final. The men's British amateur crown, however, remained in the hands of a United States player as Harvie Ward of Tarboro, N.C., succeeded Richard Chapman of Pinehurst, N.C., as champion. Ward defeated a fellow countryman, Frank Stranahan of Toledo, O., 6 and 5, in the deciding match at Prestwick, Scot.

The British open, however, went again to Bobby Locke, the South African professional. Locke in winning for the third time in four years scored 287 at St. Anne's on the Sea, Eng., leading 22-year-old Peter Thomson of Australia who totalled 288, while the Irishman, Fred Daly, who set a record 67 in the opening round, finished third at 289. Willie Goggin was the first U.S. player at 298.

A new international series began at Seattle, Wash., for the Americas cup in which amateur teams from the United States, Canada and Mexico participated. The United States representatives included Charles Coe, captain, Frank Stranahan, Harvie

Great Books of the Western World. Everyone has his own idea of the year's most important event. Looking back over 1952, many would choose the election of a new president; others the installation of a new regime in Egypt, etc. If, however, one happens to believe that in the long, sometimes the very long, run what moves large masses of men most profoundly are fundamental ideas, then one might choose a very different event as 1952's most important. We might select the publication, in April

of the 54-vol. set entitled "Great Books of the Western World."

About 20 years before, under the inspiration of John Erskine, Columbia college, Columbia, S.C., had instituted an "honours" course for undergraduates. Those who took this course read one "great book" a week for two years, beginning with Homer and ending with William James. Under the guidance of two instructors these books were discussed weekly in an evening class. Out of this quiet beginning grew the Great Books movement. By 1952, similar courses in modified form were being given in many colleges; and there were about 2,000 adult Great Books classes throughout the nation, some of which had been meeting regularly for more than 20 years.

The Great Books idea is based on two propositions, a negative one and a positive one. The negative proposition is this: A good liberal education cannot be secured if the student is permitted merely to follow his own changing whims, tastes and inclinations. The positive proposition is this: A good liberal education, or at least its basis, can be secured by the lifelong reading and study of those books in the western tradition which have, over the last 3,000 years, supplied us with our crucial ideas, insights and imaginative symbols.

The set of Great Books is a natural outgrowth of the whole movement just described. It makes available to every household that can buy the set and is willing to tackle it seriously, the Great Conversation, as Robert M. Hutchins calls it, which is really the history of western culture. Of this Great Conversation we are the products; in this Great Conversation we can join.

First, a brief description of the set. The 54 volumes are bound in four different colours—yellow for works of imagination; blue for history, ethics, economics, politics and jurisprudence; green for the sciences and mathematics; and red for philosophy and theology. They contain 25,000,000 words in 32,000 pages. They include three volumes of original material by the editors, and 443 separate works by 74 authors. There are no excerpts, except in the unavoidable cases of Aquinas, Kepler and Fourier; 21 writers are represented by their complete authentic works; 9 titles are published for the first time in English.

Contents: the complete works of Homer, Aeschylus, Sophocles, Euripides, Aristophanes, Herodotus, Thucydides, Plato, Aristotle, Hippocrates, Euclid, Archimedes, Nicomachus, Lucretius, Marcus Aurelius, Virgil, Plotinus, Montaigne, Shakespeare, Harvey and Gilbert; the major works or the recognized masterpieces of Galen, Apollonius, Epictetus, Plutarch, Tacitus, Ptolemy, Copernicus, Kepler, St. Augustine, St. Thomas Aquinas, Dante, Chaucer, Machiavelli, Hobbes, Rabelais, Galileo, Cervantes, Bacon, Descartes, Spinoza, Milton, Pascal, Newton, Huygens, Locke, Berkeley, Hume, Swift, Sterne, Fielding, Montesquieu, Rousseau, Adam Smith, Gibbon, Kant, Mill, Boswell, Lavoisier, Fourier, Faraday, Hegel, Goethe, Melville, Darwin, Marx, Tolstoy, Dostoevsky, William James and Freud; and the Declaration of Independence, the Articles of Confederation, the Constitution of the United States and the Federalist papers.

How were these names selected? Is it proper to establish an immutable canon and to call these books and no others the Great Books? The only answer is this: if five hundred reasonable men, fully conversant with the history of western culture, were asked to name the major works and authors who have determined the course of that culture, there would be disagreement. But—the disagreement would be a fringe disagreement. That is, they would agree as to about 90% of the above titles—and disagree with respect to the balance. There must be some selection. This set represents a fair and reasonable one.

¹"Great Books of the Western World"; Robert Maynard Hutchins, editor in chief; Mortimer J. Adler, associate editor; published by William Benton and Encyclopædia Britannica, Inc., in collaboration with The University of Chicago; 54 vol., \$249.50.

The value of "Great Books of the Western World" is greatly enhanced by three volumes that are the work of the editors.

In volume one, entitled *The Great Conversation*, Hutchins explains the educational principle behind the set and suggests ways—there are many—of using it. He points out that the basic ideas and imaginative symbols of our western tradition form the only common language we have; that only recently has a knowledge of this language begun to die out; that its current neglect is one reason for the confusion and babel in which we live.

Hutchins' phrase, "The Great Conversation," is not an advertising slogan. It is shorthand for a reality. Homer and Tolstoy do talk to each other, having partially the same subject matter. Volumes two and three, called *The Great Ideas, A Syntopicon of Great Books of the Western World*, demonstrate this. The demonstration cost about \$1,000,000. It involved 400,000 man-hours of reading and more than that of other labour by as many as 100 scholars. Syntopicon means "a collection of topics." It is a superindex to all the major ideas, notions, abstractions, visions, dogmas, truths (and errors), judgments and inspired guesses that have troubled the minds of the greatest intellects of our civilization for the last 3,000 years. In this Syntopicon, 163,000 references to the Great Books (plus the Bible) are ranged under 3,000 topics which are in turn grouped under 102 "Great Ideas," each idea being introduced by an essay, the work of the Syntopicon's editor, Mortimer J. Adler. Here is a basic invention that does for thought and imagination what the dictionary and encyclopedia do for words and facts. It proves that the Great Conversation exists, that the best minds of the past occupied themselves with the same persistent issues.

In addition to the Syntopicon, there are numerous other reader-aids, including extensive bibliographies and brief biographies of the 74 authors.

The Great Books set marks the progress America has made in educational philosophy since the days of the good Charles W. Eliot and his bargain-counter theory of education. Here are no snippets, but whole works. Here are no minor utterances, only basic ones. Here is the material, not for a hurried 15 minutes a day, but for a lifetime of education. (CL. FN.)

Great Britain & Northern Ireland, United Kingdom of.

An independent kingdom in north-western Europe, the United Kingdom comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six northeastern counties of Ireland. It is a constitutional monarchy, with a queen and parliament of two houses, the house of lords which on Nov. 12, 1952, consisted of 4 peers of the blood royal, 803 hereditary peers (21 dukes, 27 marquesses, 135 earls, 98 viscounts and 518 barons), 26 spiritual peers (2 archbishops and 24 bishops), 16 Scottish representative peers, a number of Irish representative peers (in 1952, 5; vacancies no longer filled) and 10 life peers who have held or hold high judicial office (2 of these were also hereditary peers); and the house of commons, numbering 625 members, elected by universal suffrage. *1937 census

Language: English is almost universally spoken, but in Wales (according to the 1931 census) 3% of the population spoke Welsh only and 31% spoke both languages; in Scotland (1951 census) 2,652 spoke Gaelic only and 91,630 spoke both languages; in the Isle of Man 528 spoke English and Manx. Religion: Church of England (nominal membership 15,000,000, effective 5,500,000); Roman Catholic Church (England, Wales, Scotland and Northern Ireland, c. 3,500,000); Presbyterian Established Church in Scotland (1,600,000 in 1949); Church in Wales (est. 250,000); Methodists (1,500,000 in 1949); Jews (c. 400,000).

Queen, Elizabeth II (*q.v.*); prime minister in 1952, Winston Churchill (*q.v.*).

History.—*Political.*—At the beginning of 1952 the United Kingdom's capacity to pull out of its financial troubles and at the same time to sustain its full rearmament effort was still in doubt, while the issue of denationalizing the iron and steel and road transport industries promised bitter political conflict. Suddenly, on Feb. 6, King George VI died. Political strife subsided and the British family were drawn together by shared grief for the loss of a fine king and a good man. The heir to the throne, Princess Elizabeth, was in Kenya with her husband, the duke of Edinburgh, at the beginning of a five-month tour to British East Africa, Ceylon, Australia and New Zealand. She flew home immediately, becoming queen shortly before her 26th birthday. Later in the year she proclaimed that the royal house would continue to be known as the House of Windsor, not Mounbatten, which would have been the case had precedent been observed. The date of the coronation was fixed for June 2, 1953.

The accession of Queen Elizabeth II was hailed as an omen of another Elizabethan age of high achievement and national glory. Soon, however, the nation was to realize that, while these hopes might remain as a spur, achievement was very closely bound up with the realities pressing upon all nations. The hard facts were that the United Kingdom had to play its part in western defense, the Korean war, the Malayan campaign against the Communists and, as the dominant partner in the sterling area, prevent the dollar gap from becoming wider. At the same time the social services and full employment had to be maintained against the pressures of increasing prices and diminishing foreign markets. On all these issues the two great parties in the state, Conservative and Labour, were substantially in agreement. It is possible that the opposition would have given general assent to the budget and defense proposals had not internal conflict divided the Labour party, the left wing of which was dominated by Aneurin Bevan. This conflict came into the open during the defense debate in the house of commons on March 5. Before the debate the parliamentary Labour party held a meeting as the result of which an official opposition amendment presented to the house expressed "no confidence in the

capacity of Her Majesty's present ministers" to carry out the government's defense program. The Bevanites within the party had proposed a wider amendment, challenging the scope and priority of the whole rearmament program. This conflict between the followers of Clement Attlee and Bevan was given plenty of air on platform and in the press. The Bevanites contended that the United Kingdom could not at the same time maintain its exports and undertake the costs of its commitments to western defense, involving two years' conscription and the turnover to armaments of a great part of the country's engineering and heavy industries. On Sept. 30, at the Labour party conference at Morecambe, the Bevanites increased their strength on the national executive committee from 4 to 6 (out of a total of 27). The appearance of triumph came from the defeat of Herbert Morrison and Hugh Dalton. (See also POLITICAL PARTIES, BRITISH.)

R. A. Butler's first budget gave more than it took from the people. It proposed certain income tax concessions and higher family allowances and pensions, which would offset cuts in food subsidies; an excess profits levy, higher motor fuel duty, flat-rate motor car and entertainments duties, the raising of the bank rate to 4%, and certain modifications of the purchase tax in favour of the consumer. Drastic reductions were made in expenditure on school building programs because of steel shortages and the priority given to house building. However, education costs were £17,000,000 higher than in 1951.

The government took steps to redeem its election promise to build new homes at the rate of 300,000 a year. Harold Macmillan, minister for housing and local government, announced in January that the program would be freed immediately from artificial restrictions and expanded to the limit of available material and labour. By midsummer it was clear that considerably more than 200,000 houses would be built by the end of the year.

The most contentious political issues were the government's decision to denationalize the iron and steel and road transport industries, nationalized by the Labour government. In opposition, Churchill had warned the government that, if returned to power, the Conservatives would reverse this legislation. Now Churchill's government was warned by Herbert Morrison that if the Socialists won power they would again nationalize both industries. Although there were precedents, these cat-and-mouse methods were widely criticized as constitutionally unhealthy.

Churchill took an early opportunity to divest himself of his office of minister of defense, and Field Marshal Viscount Alexander of Tunis (*q.v.*), governor general of Canada, took over on March 1. He was raised in the peerage to an earldom.

The overseas trade position compelled modifications in the rearmament program by midsummer, when it was announced that more of the engineering industries would concentrate upon the export trade rather than on armaments. The United States helped by placing armament contracts in the United Kingdom thus giving these products the quality of exports. The decision to exclude the United Kingdom from the Pacific defense discussions between the United States, Australia and New Zealand created a bad impression. It was felt that the United Kingdom's interests in the far east, present as well as past, and the responsibility it had borne for so long for the defense of Australia and New Zealand, apart from other reasons of common aims in world defense, entitled it to a place in these talks.

Finance and Economics.—There was common ground between the political parties on the financial problems and their causes. The United Kingdom had moved from the position of universal provider in manufactures to that of a trader having to meet the fiercest competition. That it could hope to do only in the ranges of high-class goods. Attempts to close the dollar gap by restricting imports were successful. In the first half of

Right: HER MAJESTY QUEEN ELIZABETH arriving back in London from Kenya after learning of the death of her father on Feb. 6, 1952. On hand to meet her were (right to left) Prime Minister Winston Churchill, Clement Attlee, Anthony Eden and Lord Woolton

Below: THREE BRITISH QUEENS at Westminster hall, London, where the body of King George lay in state

Below: THOUSANDS OF MOURNERS watching the funeral procession as the body of George VI was taken to Paddington station for the final journey to Windsor castle. Sailors of the royal navy pulled a gun carriage bearing the casket; behind them was the queen's coach, followed by the four royal dukes of England

1952 the United Kingdom had a surplus of £24,000,000 in its balance of payments, without reckoning U.S. defense aid; whereas at the same time, there had been in the second half of 1951 a deficit of £394,000,000. But, as Butler said on Oct. 9 at the Conservative party conference at Scarborough, there were many things still to be put right and 1953 would be tougher than 1952.

Causes for the gold and dollar deficit were stated by the treasury to be: (1) the fall in sterling area earnings in the dollar area, (2) heavy sterling area purchases in the dollar area and (3) sterling area heavy deficits with the Organization for European Economic Cooperation countries. At the Commonwealth Finance Ministers conference in London in January the main action decided was tighter credit to combat inflation; efforts to increase export earnings; import cuts; and long-term borrowing "in some countries." The November conference was concerned with trade between the commonwealth nations and the finding of an agreed policy for the sterling area. The United Kingdom was concerned to maintain if not to increase its commonwealth trade, but it had great difficulty in doing this with Australia because of the adverse balance of payments there, and with Canada because the Canadian dollar was the world's hardest currency.

Food and raw material prices began to rise early in the year. These led to higher wage demands with their consequent effect on costs of production. Butler announced emergency measures to save £150,000,000 in external expenditure (bringing the total foreign exchange savings to £500,000,000 since the Conservative government came into power). The gold and dollar position improved so that the loss in the second quarter was less than \$16,000,000. The reserves stood at \$1,700,000,000 and Churchill claimed that by the end of the year the United Kingdom would be paying its way. However, a decline in government security prices set in at the end of September and upset the government's financial policy, although it justified Churchill's warning earlier in the year that the country's prosperity rested on a trap door. It was expected that, when parliament reassembled, steps would be taken to reverse the credit inflation policy which had sustained government security prices in the summer. (See also BUDGET, NATIONAL; INTERNATIONAL TRADE.)

Industry.—Production continued to expand, an exception being the cotton industry, and the full employment policy was maintained. A total of 22,221,000 in civil employment was the highest ever. Coal output improved steadily and a total of 220,000,000 tons for the year was expected. Steel production, which had receded in 1951 by 665,000 tons, recovered to the rate of about 16,500,000 tons a year. Industrial disputes tended to have a political purpose, but the Trades Union congress and the unions discouraged this and, indeed, gave general consent to Butler's appeal for moderation in wage claims, which was supported by Hugh Gaitskell, former Labour chancellor of the exchequer.

Weekly wage increases for the first eight months were £2,338,900 for 6,101,000 workers, compared with £3,713,000 for 8,504,000 workers in the corresponding period of 1951. Included were increases for most civil servants at a cost of about £35,000,000 a year. The miners' claim of 30 s. a week extra and the engineers' for £2 a week were not settled. While the miners' case went automatically to arbitration, the engineers refused arbitration and decided on a national ban on overtime and strict limitation of piecework in the engineering, shipbuilding and ship-repairing industries after Oct. 20. This affected 3,000,000 workers and was a threat to the rearmament program as well as to export trade. On Oct. 8, however, the leaders of the Confederation of Shipbuilding and Engineering union agreed to postpone indefinitely their ban after an assur-

"KICKING A CRIPPLED LION," a 1952 cartoon by Costello of the *Knickerbocker News* (Albany, N.Y.)

ance from employers that pay negotiations with the union would open.

The *Ministry of Labour Gazette* showed the index of wage rates in April to be 128 (June 1947=100); while the retail prices index was 137 on Aug. 12 (June 17, 1947=100), a fall of one point from the previous month. Average weekly earnings for all classes and ages of workers in April were £7 7s. 3d. compared with £2. 13s. 3d. in Oct. 1938. (See also ATOMIC ENERGY; COAL EMPLOYMENT; LABOUR UNIONS; STRIKES; WAGES AND HOURS.)

Foreign Affairs.—Anglo-American understanding remained the basis of U.K. international policy. In January Churchill and Eden visited the United States for talks with Pres. Harry Truman and Dean Acheson. Both countries reaffirmed their joint efforts toward "building up the strength of the free world"; they agreed on maintenance of the U.S. bases in the United Kingdom; reaffirmed their peaceful intentions and efforts to maintain peace; and gave full support to establishing the European Defense Community and to promoting stability and peaceful development in the middle east, where it was essential to set up a middle east command. There were discussions on the sharing of scarce materials, and it was agreed that the United States would let the United Kingdom have 1,000,000 tons of steel in 1952, while the United Kingdom would make available to the United States 55,100,000 lb. of Canadian aluminum and 20,000 long tons of tin. The United Kingdom also transferred to the United States 20,000 tons of rubber for strategic stock-piling.

The United Kingdom ratified the Japanese Peace treaty, but the Labour party expressed fears of unfair competition with British industries. This fear was found to be justified later in the year when Japanese cotton competed with Lancashire goods in Asia and west Africa. Lancashire called for an understanding between the U.S., Japanese and U.K. exporters and a three-

nation conference on the matter was held in Buxton, Eng., in September–October. The U.S. and Japanese exporters stood for free unlimited competition against the British contention for the division of markets and no satisfactory arrangement was in sight.

In Europe the United Kingdom found itself in an anomalous position vis-à-vis the Council of Europe and the six nations of the European Coal and Steel community. While the movement toward an integration of European states was largely inspired by the United Kingdom, the two main British parties agreed that it could not itself become a member of the federation or of the coal and steel community, because of its unique position as centre of a world-wide commonwealth, an Atlantic power and a European power. It was, however, a member of the Council of Europe. In September the coal and steel community decided to work out plans for an European political community, taking the task out of the hands of the Council of Europe. The danger to the United Kingdom was that it might be isolated from Europe politically and economically while carrying so much of the burden of Europe's defense. Point was lent to this by the growing influence of Germany in the European Coal and Steel community.

The failure to reach a decision in the Korean war was a continued irritation, but this was allayed somewhat by the visit of the minister of defense (Alexander) and the minister of state (Selwyn Lloyd) to the supreme commander's headquarters.

The Iranian oil position did not improve, although the Truman-Churchill offer to Mohammed Mossadegh provided for arbitration, the lifting of certain financial restrictions and the immediate granting of \$10,000,000 from the United States. The proposals were rejected. Previously, in July, the International Court of Justice at The Hague had decided that it was not competent to consider the British charge that Iran had violated international law in nationalizing the Anglo-Iranian Oil company's £500,000,000 Iranian properties.

The only overt British reaction to the Egyptian constitutional crisis was a reaffirmation of the pledge of self-government and self-determination for the Sudan while offering to include Egypt as an equal partner in the middle east defense system.

Anthony Eden visited Marshal Tito in Yugoslavia in September. Tito was invited to visit Britain. These talks were regarded as of the first importance because they indicated the growing disposition of Tito's Yugoslavia to work in harmony with the western world. (See also EGYPT; EUROPEAN UNION; IRAN; KOREAN WAR; NORTH ATLANTIC TREATY ORGANIZATION; UNITED NATIONS.)

Commonwealth.—Australia's decision in April to cut imports by £A500,000,000 to £A600,000,000 a year was a heavy blow to British trade. Australia had a similar problem as the United Kingdom in trying to balance its payments.

In Malaya the high commissioner, Sir Henry Gurney, had been assassinated in Oct. 1951 and was succeeded in Jan. 1952 by Gen. Sir Gerald Templer who intensified the campaign against the Communists in the Malayan federation.

The plan for a Central African federation involving Northern and Southern Rhodesia and Nyasaland, initiated by the Labour government, was taken a step further by the holding of a London conference, but little progress was made toward allaying the fears of the coloured Africans of Northern Rhodesia and Nyasaland that their interests would not be maintained by federation. In the United Kingdom public feeling hardened against the apartheid policy of the South African government and that government's claim for the incorporation of the British high commission territories in the union. (See also COMMONWEALTH OF NATIONS and articles on the various member countries.)

Report on Economic Situation, prepared by General Council for the Margate Congress (Aug. 19, 1952); *Iron and Steel* (London, July 28, 1952); *Towards World Plenty*, Labour Party pamphlet (July 1952); *National Coal Board Report for 1951* (May 1952). (D. R. PR.)

Education.—(1951, unless otherwise stated) *England and Wales*: nursery schools and classes, pupils 82,076; primary schools 23,118, secondary schools 5,016, total primary and secondary pupils 5,823,819; special schools (for physically or mentally handicapped children) 634, pupils 49,054; further education (mainly evening institutes) 11,439, pupils 54,360 full-time and 2,305,037 part-time; full-time teachers (all schools) 224,069. *Scotland*: nursery schools and classes, pupils 4,412; primary schools 2,870, pupils 546,336, teachers 17,628; secondary schools 909, pupils 232,897, teachers 12,976; special schools, pupils 10,351; further education (mainly continuation-class centres) 1,494, pupils 272,308 (262,885 part-time, 9,423 full-time). *Northern Ireland*: nursery schools 23, pupils 709; primary schools 1,629, pupils 192,736; secondary schools 92, pupils 36,321; special schools, pupils 776.

Universities (1951–52): *England*: 13, full-time students 59,814, teaching staff (1950–51) 5,439; *Scotland*: 4, students 15,267, teaching staff 1,380; *Wales*: 1, students 4,874, teaching staff 568; *Northern Ireland*: 1, students 2,277, teaching staff 356. University colleges (institutions with either limited or no power to confer degrees): *England*: 4, full-time students 3,815, teaching staff 438; *Wales*: 1, students 160, teaching staff 12.

Finance and Banking.—Budget (actual 1951–52): revenue £4,433,400,000, expenditure £4,053,700,000; (est. 1952–53) revenue £4,661,400,000, expenditure £4,230,600,000. National debt (Sept. 30, 1952) £26,129,000,000. Currency circulation (Sept. 30, 1952) £1,445,700,000. Gold and dollar reserves of the sterling area (Sept. 30, 1952) U.S. \$1,685,000,000. Exchange rate since Sept. 18, 1949, £1 = U.S. \$2.80.

Foreign Trade.—Imports (1950) £2,608,200,000, (1951) £3,916,800,000; exports including re-exports (1950) £2,256,000,000, (1951) £2,707,100,000. Main sources of imports (1950); sterling area 38%, dollar area 18.4%, nonsterling countries in the Organization for European Economic Cooperation 25.2%. Main destinations of exports (1950): sterling area 48%, dollar area 13%, nonsterling O.E.E.C. countries 25.2%.

Transport and Communications.—Railways: *Great Britain*, total first track (all gauges, 1950) 19,500 mi.; *Northern Ireland* (1949) 1,035 mi. Passenger journeys originating (British railways, monthly average, 1951) 103,000,000. Freight traffic originating (weekly average 1951) 5,100,000 tons; net ton-miles 439,000,000. Roads (1950): *Great Britain*, 183,821 mi. Motor vehicles licensed (Dec. 1951): 4,625,000, including 2,380,000 cars; new registrations (1951) 413,916, including 137,316 cars. Air transport (U.K. air lines, all services, monthly averages, 1951): miles flown 4,472,000, passengers carried 117,600; passenger-miles 89,600,000; freight carried 2,617,000 short ton-miles; mail carried 1,450,000 short ton-miles. Shipping: merchant vessels on the U.K. register, 500 gross tons and over (Aug. 1952): nontankers 13,073, tankers 4,428. Shipping movement at U.K. ports (net registered tons, monthly average, 1951): entered with cargo, mail only 74,000, other 5,224,000; entered in ballast with passengers only 369,000, calling for bunker only 73,000, other 782,000. Number of private telephone stations (March 31, 1950): 5,171,491 (approximately 70% with automatic dial). Radio receiving sets licensed (Aug. 1952): 11,208,000; television licences (Aug. 1952): 1,597,900.

Agriculture and Fisheries.—Production (long tons, 1952 est.): wheat 2,216,000; barley 2,199,000; oats 2,595,000; rye 52,000; mixed corn 813,000; potatoes 7,266,000; sugar 4,327,000. Livestock (June 1952): cattle 10,253,000; sheep 21,653,000; pigs 4,923,000; poultry 94,664,000.

Fisheries (total catch, 1951): *England and Wales*, 700,100 long tons, worth £34,476,000; *Scotland*, 244,200 long tons, worth £10,858,000. This excludes shellfish but includes gray mullet and whitebait.

Industry.—The number of industrial establishments with more than ten employees (April 1948) was 51,040. The total working population in 1952 was 23,316,000 of whom 15,978,000 were men. There were 872,000 in the armed forces, of whom 848,000 were men. There were 415,000 registered unemployed, compared with 188,000 a year before.

Industrial production (1951): coal 222,180,000 long tons; gas 556,920,000 cu.ft.; electricity 59,964,000,000 kw.hr.; iron ore (metal content) 14,664,000 long tons; pig iron 9,497,000 long tons; crude steel 15,638,000 long tons; tractors 140,210; motor cars 475,919; trucks 257,964; steam locomotives 719; railway coaches 2,331; freight cars 41,447; aircraft (excluding military except for export) 527; shipbuilding (completed merchant vessels, 100 gross tons and over) 1,343; cotton woven cloth 2,199,000,000 yd.; woven wool fabrics 418,000,000 sq.yd.; rayon filament yarn 216,000,000 lb.; rayon staple fibre 167,000,000 lb.

Great Lakes Traffic: see CANALS AND INLAND WATERWAYS.

Greece. Greece is a kingdom in the southern part of the Balkan peninsula. Area: 51,182 sq.mi. including the Dodecanese Islands (1,035 sq.mi.); the mainland accounts for 41,328 sq.mi. and the Aegean islands, of which the largest is Crete (3,235 sq.mi.), for 9,854 sq.mi. Pop.: (1940 census, without the Dodecanese) 7,344,860; (1951 census) 7,631,124. Language (1940 census): Greek 6,794,309 (93%); Turkish (Turks and Turkish-speaking Greeks from Anatolia) 222,968; Macedonian Slav 81,860; Vlach 57,263; Albanian 69,629; Bulgarian (Pomaks) 18,086, etc. Religion (1940 census): Greek Orthodox 7,090,192 (96.5%); Roman Catholic 29,136; Gregorian (Armenian) 16,350; Moslem 134,722; Jewish 53,095 (reduced to

9,000). Chief towns (1951 census, municipal area only): Athens (cap., 559,250); Piraeus (184,980); Salonika or Thessaloniki (216,838); Patras (88,414); Volos (51,134); Larissa (43,163). Ruler, King Paul I; prime ministers in 1952: Gen. Nicholas Plastiras, Demetrios Kiousopoulos and after Nov. 19 Field Marshal Alexander Papagos.

History.—The absence of any guerrilla warfare noted during 1951 continued throughout 1952, but evidence of subversive underground activity came to light following the discovery of two secret hiding places in the outskirts of Athens containing radio transmitters and other apparatus. Police raids on these hiding places led to the arrest of 29 persons, including 8 women, who appeared before the Athens Permanent Military court in February. Their trial, lasting two weeks, culminated in the sentencing to death of 8 of the accused, including the ring leader Nicholas Beloyannis who had been sent from abroad by the Communist party, and of another 14 to various terms of imprisonment. The Council of Grace allowed four of the appeals against the death sentence; the other four prisoners were executed on March 30.

The Pacification bill, from which nearly 20,000 persons serving prison sentences derived benefit, was ratified by parliament on March 9. By virtue of this measure all death sentences passed before Oct. 31, 1951, were automatically commuted to imprisonment, and the release was authorized, under certain conditions, of persons serving sentences of 10 to 20 years' imprisonment for crimes relating to the Communist rebellions, with the exception of espionage.

The decision reached at the North Atlantic Treaty organization (NATO) conference at Ottawa, Ont., in Sept. 1951 to invite Greece and Turkey to adhere to the treaty came into effect in February in time for Greece to participate in the Lisbon conference as a full member. Panayotis Pipinelis, a diplomat and former foreign minister, was appointed permanent delegate to the NATO deputies' council.

On July 16 it was announced from SHAPE that the Southern Europe command would consist of two sectors, and that the Greek land forces would be included in the southeastern European sector of this command, with headquarters at Smyrna, Turk., and an advance echelon at Salonika. During the year several NATO military leaders, including Gen. M. Ridgway and Field Marshal Viscount Montgomery, visited Greece and had conversations with Greek military chiefs.

In September it was announced from Athens that the period of military service would be reduced to 24 mo. (in certain cases to 30 mo.).

Foreign Affairs.—The improvement in Graeco-Yugoslav relations showed further steady progress during the year. A Greek parliament delegation comprising 18 deputies of all parties headed by the speaker of the chamber, Demetrios Gondikas, paid a visit to Yugoslavia in July. The visit was returned in August by a 14-member Yugoslav parliamentary delegation headed by the vice-president of the presidium of the Yugoslav People's assembly, Moshe Pijade. A Yugoslav military mission also visited Greece in September "to establish contact with the leaders of the Greek armed forces in order to complete the atmosphere of friendship already existing in other spheres." During the year two further groups of Greek children from among those abducted by the Greek Communist forces during the guerrilla war were repatriated from Yugoslavia with the co-operation of the International Red Cross. On Sept. 15 it was announced that Greece and Yugoslavia had decided to raise their respective legations in Belgrade and Athens to the status of embassies.

In January Sophocles Venizelos, deputy premier and foreign minister, visited Ankara to discuss defense and other matters,

TWO GREEK WOMEN accused of espionage leaving an Athens courtroom under heavy guard during a recess in courtmartial proceedings early in 1952. They were among 29 defendants charged with sending secret information to agents of the Cominform

and a Mixed Graeco-Turkish commission was set up to deal with questions of common interest. Adnan Menderes, the Turkish premier, and Fuat Köprülü, foreign minister, paid an official visit to Greece in April, and in June King Paul and Queen Frederika paid a state visit to Turkey, this being the first occasion on which a Greek sovereign had paid an official visit to that country.

On July 26 a clash occurred between Greek and Bulgarian patrols on the disputed islet of Gamma in the Maritsa (Evros) river near the point of junction of the Greek, Bulgarian and Turkish frontiers. A U.N. Balkan commission observers' team investigated the incident on the spot and submitted a report to the U.N., placing responsibility for the incident on Bulgaria but stressing the need for a delimitation of the Graeco-Bulgarian frontier on the Maritsa if fresh incidents of this kind, constituting a threat to Balkan peace, were to be avoided.

Home Politics.—The coalition government of National Progressives (E.P.E.K.) and Liberals sworn in on Oct. 27, 1951, continued in office, despite its narrow majority. There was steadily growing friction with the main opposition party, the Greek Rally, led by Field Marshal Alexandros Papagos. On March 31 all the Greek Rally deputies withdrew from the chamber in protest against an order of the day issued by Vice-Adm. Alexandros Sakellariou, minister of defense, which the Rally considered as reflecting on Field Marshal Papagos; although Sakellariou had resigned from the government on March 28, the deputies did not return until April 15 after the offending order had been declared annulled by the prime minister.

On March 10 General Plastiras was taken seriously ill with cerebral thrombosis and delegated his powers to Venizelos before leaving for France to undergo treatment. Although not fully cured, he had sufficiently recovered to return to Athens early in August and open a full-dress debate in the chamber on the government's economy policy. The debate culminated on Aug. 22 in a vote of confidence for the government by 127 votes to 118. Soon afterward the government introduced in parliament a new electoral law restoring the majority system in

place of the proportional system hitherto in force. The new law was passed by a majority vote after a three-week debate and was signed by the king on Oct. 5. The government resigned Oct. 10. King Paul proclaimed new elections for Nov. 16 and appointed Demetrios Kiousopoulos to head the government in the interim. Field Marshal Papagos and the Greek Rally won a sweeping majority in the elections, capturing 239 of the 300 seats in the national assembly. (A. A. P.)

Education.—Schools (1951-52): primary 8,613, pupils 921,632; secondary 314, pupils 178,098; universities 2, professors and lecturers 211, students 6,730; other institutions of higher education 4. Illiteracy (1941): 27% average.

Finance and Banking.—Budget (1951-52 actual) revenue dr. 5,879,000,000,000; expenditure dr. 7,459,000,000,000; (1952-53 est.) revenue dr. 7,892,000,000,000, expenditure dr. 8,291,000,000,000. Currency circulation (Aug. 1952): dr. 2,181,813,000,000. Bank deposits (Aug. 1952): dr. 2,083,791,000,000. Monetary unit: drachma with an exchange rate (Oct. 1952) of dr. 42,000 to the pound sterling and dr. 15,060 to the U.S. dollar.

Foreign Trade.—(1951): Imports dr. 5,974,000,000; exports dr. 1,526,000,000. Main sources of imports (1951): U.S. 30%; U.K. 15%; Germany 9%; Italy 9%. Main destinations of exports: U.K. 15%; U.S. 14%; Germany 20%; France 11%. Main exports (1951-52): tobacco 10%; currants and raisins 20%; olives and olive oil 3%; wines and liquors 3%.

Transport and Communications.—Roads (1950): 15,486 km. Licensed motor vehicles (June 1952): cars 9,337, commercial vehicles 21,250. Railways (1950): 2,679 km. (1,325 km. state-owned); number of locomotives 145. Shipping: merchant vessels of 100 gross tons and over (Dec. 31, 1951) 331; total tonnage 1,259,365. Telephone subscribers (1951): 81,905. Radio receiving sets (1951): 225,000.

Agriculture and Fisheries.—Main crops (metric tons, 1951): wheat 330,000; barley 230,000, (1952) 235,000; oats 140,000, (1952) 140,000; rye 48,000; maize 220,000; potatoes 413,000; rice 56,000; grapes 110,000; citrus fruit 137,000; tobacco 62,000; cotton 81,000; olive oil 160,000. Livestock (Dec. 1950): cattle 700,000; sheep (Jan. 1951) 3,844,000; pigs 550,000; horses 238,000; mules 156,000; goats (1951) 1,083,000. Meat production (1951): 75,800 metric tons. Fisheries: total catch (1951) 45,000 metric tons.

Industry.—Fuel and power: lignite (1951) 177,010 metric tons; electricity (installed capacity, 1950), 245,000 kw. Raw materials (metric tons, 1951): bauxite 163,000; magnesite 15,000; iron pyrites 181,000; chromite 25,000. Index of industrial production, 1951 (1948=100): general 171; manufacturing industries 175.

Greenland. A large island (840,000 sq.mi., about 705,000 sq.mi. covered by an ice cap), Greenland is a Danish possession in the North Atlantic ocean, northwest of Iceland. Pop. (1950 est.): 23,019, distributed in settlements along the west coast except for 1,588 on the east coast; 941 Europeans (mostly Danes), the rest native Greenlanders (Eskimos). Language: Danish and Eskimo. Religion: Lutheran. Capital, Godthaab (second governor's seat, Godhavn). Governor general in 1952, Poul Hugo Lundsteen.

History.—In accordance with the Danish-U.S. agreement of April 27, 1951, for the joint defense of Greenland, the U.S. air force in the summer of 1952 pursued the construction of an air base at Thule in the far north of Greenland, work having been started late in the summer of 1951. The base, whose code name was "Blue Jay," was to be completed in 1953 and its cost was estimated at nearly \$300,000,000.

At a meeting in Copenhagen, Den., on June 28 a new company was set up to extract rich mineral deposits, especially of lead, zinc and wolfram, which had been discovered three years previously in the Mesters Vig area (region of Kong Oscars fjord) of eastern Greenland by the Danish geologist Lauge Koch. The new company, Det Nordiske Mineselskab A/S, had an initial share capital of 15,000,000 Kr., of which the Danish government took over 27.5%, Danish industrial, commercial and banking interests another 27.5%, while the remaining 45% was taken over jointly by the Canadian mining concern Frobisher's, Ltd., and the Swedish Boliden Mining company. Investigations had revealed lead deposits under the ice of eastern Greenland amounting to 400,000 tons, and further drillings were expected to confirm still larger deposits of lead, zinc and wolfram. The first group of 140 scientists, technicians and workers started the preparatory works at Mesters Vig in July, laying out *inter alia*

a landing strip for planes. It was stated that the total capital eventually required for the Nordiske Mineselskab would be from 100,000,000 Kr. to 150,000,000 Kr.

The development of political and social life in Greenland called for abolition of the existing colonial status of the island, and the country council asked in the summer for Greenland representation in the Danish *rigsdag*. King Frederick IX of Denmark, accompanied by Queen Ingrid, paid an official visit to Greenland in July, this being the first occasion for more than 30 years on which a Danish monarch had visited the colony. (H. LN.)

Education.—Schools (1948): infant and primary 175, pupils 4,200, teachers 237; postprimary 4, pupils 100, teachers 15; technical 1, pupils 50, teachers 2. Institutions of higher education 2, students 45, lecturers 10.

Finance.—Budget (1948-49): revenue 17,449,000 Kr., expenditure 23,593,000 Kr. Monetary unit: Danish krone, with an exchange rate of 19.34 Kr. to the pound and 6.92 Kr. to the U.S. dollar.

Foreign Trade.—(1950) Imports from Denmark 23,300,000 Kr., exports to Denmark 16,800,000 Kr.; imports from U.K., £53,385, (1951) £45,198; exports to U.K. £752, (1951) £1,926.

Agriculture and Fisheries.—Sheep (1949-50) 11,000. Fisheries (1950) salted cod exported 7,000 metric tons.

Grenada: see WINDWARD ISLANDS.

Gromyko, Andrei A. (1909-), soviet diplomat, was born on July 5 in Starye Gromyki, Byelorussia. He graduated from the Minsk Institute of Agricultural Economics in 1934. In 1938 he was taken into the commissariat for foreign affairs, and after a year's training was sent to Washington, D.C. In Aug. 1943 he succeeded Maxim Litvinov as soviet ambassador to the U.S. and to Cuba. He headed the soviet delegation to the Dumbarton Oaks conference in 1944, attended the United Nations organization conference at San Francisco, Calif., in 1945, and was appointed chief soviet representative to the U.N. On April 10, 1946, he was freed from his duties as ambassador to become permanent soviet delegate to the U.N. Security council. On Dec. 29, 1947, it was announced that he had been promoted to deputy foreign minister, and in July 1948 he was replaced on the Security council by Jacob Malik and returned to Moscow.

In Sept. 1951 Gromyko was soviet spokesman at the San Francisco conference to sign the Japanese peace treaty, and he sought repeatedly to upset the conference schedule, first by calling for the seating of Red China, then by opposing motions that limited debate and barred soviet efforts to amend the draft of the treaty. He was finally voted out of order and silenced. In June 1952 he was named soviet ambassador to Great Britain.

Ground Observer Corps: see AVIATION, MILITARY; CIVIL DEFENSE, U.S.

Guadeloupe. This French overseas *département*, situated in the Lesser Antilles, consists of two main and five smaller islands. Total area: 686 sq.mi. Pop.: (1946 census) 278,464; (1951 est.) 292,000, mainly Negro or mixed. Language: French patois. Religion: Roman Catholic. Chief towns (pop., 1946 census): Basse-Terre (cap., 10,086); Pointe-à-Pitre (41,323). Prefect: Gaston Villeger.

History.—Two Radicals were elected to the senate in May 1952, defeating Socialist and Communist candidates. A series of strikes in January was accompanied by a certain amount of disorder.

Pointe-à-Pitre airport was completed; it had 1,600 m. of runway. Runways were also being constructed on Marie Galante, Saint Martin and Saint Barthélémy. A circular road was being made. Irrigation works were begun at La Grande Terre. Vats were set up for storing rum.

Education.—All children of school age receive primary education; there are two lycées.

Foreign Trade.—(1951) Imports 9,146,000,000 fr. (including 7,800,000,000 fr. from the French union); exports 8,100,000,000 fr. (including 7,800,000,000 fr. to the French union), mainly sugar (3,830,000,000 fr.), bananas (2,400,000,000 fr.), rum (1,136,000,000 fr.).

Transport and Communications.—Ships entered (1951), 593.
(Hu. De.)

Guam. Guam is the largest and southernmost island of the Marianas, lying in the Pacific at 13° 26' N. lat. and 144° 39' E. long., about 5,100 mi. W. of San Francisco, Calif., 3,340 mi. W. of Honolulu, T.H., and 1,500 mi. E. of Manila, Phil. Area: 206 sq.mi. Population, June 30, 1952, 59,498, of which about 28,500 were Guamanians and the rest non-Guamanians, of whom about half were U.S. military and civil service personnel, and the other half workers recruited in the U.S., Hawaii, the Philippines and other Pacific islands. Agaña is the capital. Other important towns are Sinajana and Inarajan. The Guamanians are Chamorros, and their religion is predominantly Roman Catholic. Governor in 1952: Carlton Skinner.

History.—Guam is an unincorporated territory of the United States and an organized sovereignty, governed under the Organic Act of Guam, passed by the U.S. congress and approved by the president on Aug. 1, 1950. Under this legislation, Guamanians became citizens of the U.S., with all rights and privileges thereof, replacing their former status as citizens of the territory and nationals of the United States.

In 1952 Guam's approximately 30,000 ac. of public domain lands were transferred from the jurisdiction of the U.S. department of interior to the government of Guam. The land was to be used for the rehabilitation of persons who lost their homes during World War II.

Education.—In 1951 there were 21 public elementary and junior high schools and 1 high school with a total of 9,225 pupils and 311 teachers. There were also 4 parochial schools with 1,164 elementary and secondary school students. Instruction is given in English. About 84% of the population was literate according to the 1940 census.

Finance.—During the fiscal year ending June 30, 1951, Guam's expenditures amounted to \$5,114,405, revenues amounted to \$4,168,867 and U.S. grants amounted to \$1,200,000.

Production and Trade.—Agricultural production in the year ending June 30, 1951, included (in pounds): corn 416,430; coconut 316,330; vegetables 230,860; bananas 200,400; taro 192,790; sweet potatoes 161,090; cassava 120,820; yams 81,106; watermelon 55,040; papaya 51,520; sugar cane 37,865; and mango 37,000. The fish catch in the same period totalled 691,140 lb. In 1951 Guam had about 10,000 hogs, 4,000 cattle, 70 horses, 100,000 chickens and 1,125 goats. In the fiscal year ending June 30, 1951, imports totalled \$12,504,246 and exports \$2,231,192. The major imports were foodstuffs, building materials, textiles, tobacco and liquor. The major exports were 11,000 tons of scrap metal and 349 tons of copra. Guam's imports come in descending order of importance from the United States, Japan, the Philippines, Hong Kong, Hawaii and Australia; exports go to the United States, Hawaii and the Philippines.

Transportation and Communications.—In 1952 there were 80 mi. of paved highways in Guam and about 60 mi. of improved secondary roads. There were no railways, but five military airfields. The navy operated the island's telephone and electricity systems. Radio facilities existed through the U.S. armed forces radio network and the Andersen airfield radio station. Pan American World Airways and Philippine Airlines provided air service for the island.
(S. Nr.)

Guatemala. A Central American republic, Guatemala is bounded by Mexico, British Honduras, Honduras and El Salvador. Area: 45,452 sq.mi.; pop. (1950 census of the Americas): 2,787,030; (1951 est.): 2,887,000. Capital: Guatemala City (1946 est. pop., 225,000). Other urban centres (1940 census) are Antigua Guatemala (12,601), Chiquimula (10,868), Comalapa (10,461), Mazatenango (14,227), Puerto Barrios (15,784), Quezaltenango (33,538) and Zacapa (14,443). Language: Spanish; religion: predominantly Roman Catholic. President in 1952: Lieut. Col. Jacobo Arbenz Guzmán.

History.—Charges of increasingly Communist orientation continued to be made against the Arbenz administration as U.S. firms doing business in Guatemala faced renewed difficulties in 1952. The United Fruit company was ordered in January to pay \$500,000 in back wages to 3,700 employees who had been laid off after a hurricane had devastated the company's Pacific coast banana plantations in Sept. 1951. The order stipulated that the

United Fruit company's \$25,000,000 investments in Guatemala would be "embargoed" if the measure were not obeyed. The company protested the ruling, and on Feb. 19 a labour court set March 5 as the date for auctioning off a portion of United Fruit's properties in the country. Shortly afterward, two U.S. congressmen from Massachusetts, John W. McCormack, Democrat, and Joseph W. Martin, Jr., Republican, issued a joint statement asserting that Guatemala had become a "beachhead" of Communism; Martin pointed to the United Fruit company's predicament as illustrative of the "ruthless nature of the Communist attack." On March 3 fires ravaged the banana fields. Tiquisate, virtually completing the ruin of the company's plantations on the Pacific coast. At length, the Arbenz government cancelled the scheduled auction, after United Fruit agreed to (1) pay \$650,000 in back wages, (2) extend its union contract for three years, (3) reinstate laid-off workers and (4) rehabilitate the damaged plantations. The company resumed operations in Guatemala on March 17. A month later, the Pan-American Life Insurance company, a New Orleans corporation which had been doing business in the country for 30 years, withdrew from Guatemala, alleging its inability to comply with the government's restrictive insurance law. An agrarian reform law designed to subdivide landed estates larger than 225 ac. entered into force on June 18. The measure provided for the reimbursement of dispossessed landowners during a 25-year period.

Meanwhile, illegal anti-Communist demonstrations were held throughout the country on March 23; an estimated 30,000 participated in the meetings at Guatemala City alone. On April 11 two labour unions, representing about 80,000 workers, announced that they would not take part in the May 1 Labour day rally, charging that the demonstration would be Communist-oriented.
(G. I. B.)

Education.—In 1949-50 there were 3,397 primary schools with 9,770 teachers and 164,815 pupils in attendance; secondary and other schools had 1,126 teachers and 57,708 pupils in attendance. University education was available at the University of Guatemala. The 1950 census showed that 72.2% of those seven years of age and over were illiterate. Education was scheduled to receive 14% of the 1952-53 budget.

Finance.—The monetary unit is the quetzal, at par with the U.S. dollar. The 1952-53 budget was initially placed at \$63,400,000, the largest on record (1951-52, \$59,664,000). The internal debt on Dec. 31, 1951, was reported to be \$18,898,743 and the external debt \$86,480. Currency in circulation (July 31, 1952) was \$40,400,000; gold reserves \$27,200,000; demand deposits \$23,600,000; time deposits \$1,100,000; government deposits \$6,900,000. The cost-of-living index stood at 96 on June 30, 1951 (1948=100).

Trade and Communications.—Exports in 1951 totalled \$76,084,997; imports \$80,846,452. Leading exports were coffee (77%), bananas (8%), essential oils (3%) and chicle (3%). Leading customers were the U.S. (88%), the Netherlands (3%), Canada (3%) and Belgium (2%). Leading suppliers, the U.S. (67%), Mexico (5%), Germany (5%), the United Kingdom (4%) and the Netherlands Antilles (4%).

In 1950 there were 608 mi. of railroad on which 3,826,700 passengers were carried. Highway mileage (1949) was 4,800.

Agriculture.—Production of coffee in the 1951-52 season was 1,100,000 bags of 132 lb. each, of which 900,000 bags were exported (1950-51 exports, 818,244 bags). Banana exports in 1951 amounted to 5,264,832 stems. Other crops (with 1950-51 production estimates) were white sugar 27,375 short tons; panela 28,893 tons; corn 710,000,000 lb.; bean 130,000,000 lb.; abacá 8,700,000 lb.; rice 15,000,000 lb.; and lint cotton 2,900,000 lb. The 1950 livestock census showed 902,915 cattle, 415,293 pigs, 711,579 sheep and 182,580 horses. Essential oil exports (large citronella and lemon grass) totalled 1,500,000 lb. in 1951. Chicle exports were 2,630,000 lb.

Manufactures.—The most important industries, by value of production were beverages, foodstuffs, textiles, clothing and tobacco. Cement production totalled 57,500 metric tons in 1951.

Gymnastics. The senior championships of the Amateur Athletic union of the United States and final Olympic tryouts for men and women were combined in two days of competition that drew a star field to Penn State college, State College, Pa., April 25-26, 1952. Only two champions repeated in the men's group, Richard Browning of Champaign, Ill., in tumbling, and Gene Rabbitt of the Florida State Gymkana club, on the side horse.

Robert Stout, Philadelphia Turners, scored 329.7 points for all-around honours and also won on the horizontal bar. Edward Scrobe of the American Turners, New York city, triumphed on the parallel bars and was runner-up for the all-around prize with 328 markers. Jean Cronstedt, Penn State college, an exchange student from Finland, was victor in calisthenics. Other victors were Don Perry, Pasadena City college, Pasadena, Calif., who tied his own world record of 3.1 sec. in the rope climb; Archie Durham, Pasadena City college, long horse; George Wickler, U.S. coast guard, Los Angeles, rings; Frank La Due, State University of Iowa, Iowa City, trampoline, and Philadelphia Turners, team.

The women's division was dominated by Clara Schroth Lomady, Philadelphia Turners, and Meta Elste, Chicago, who was competing unattached. Mrs. Lomady retained her championships in calisthenics, the side horse and parallel bars and again annexed all-around laurels with 220 tallies. Miss Elste defeated Mrs. Lomady in the balance beam event and was runner-up in nearly every other major contest. She finished with 216.6 points in competition for the all-around crown. Barbara Galleher, Dallas A.C., was first in tumbling.

Florida State college, Tallahassee, won team honours for the second straight year in the National Collegiate Athletic associa-

tion meet at Boulder, Colo., March 22-23. The winners scored 89½ points compared with 75 for the University of Southern California, Los Angeles, which placed second. Individual champions follow: John Claybrook, U.S. Military academy, West Point, N.Y., rope climb; Frank Bare, University of Illinois, Urbana, side horse; Charles Simms, University of Southern California, horizontal bar; John Beckner, University of Southern California, parallel bars; Jack Sharp, Florida State, flying rings; Bob Sullivan, University of Illinois, tumbling; and Dick Gutting, Florida State, trampoline. The U.S. Military academy annexed three events in the Eastern intercollegiate individual championships, Penn State winning two tests and Syracuse university, N.Y., and the U.S. Naval academy, Annapolis, Md., one each. Nebraska gymnasts scored a sweep of the individual and team laurels in the fourth annual Rocky Mountain invitation meet. (See also OLYMPIC GAMES.) (T. V. H.)

Gynaecology and Obstetrics. For several years a trend had been developing toward unification of obstetrics and gynaecology into a single specialty. By 1952 with but few occasional exceptions, they had been so united. This contributed to improved standards in diagnosis and treatment, enhanced specialization and improved teaching programs of students, interns and residents.

One condition of the newborn which received continued attention in 1952 was the damage caused by German measles or rubella. This contagious disease produced its greatest damage in the first three or four months of pregnancy. It was most likely

MIDWIFERY CLASS in session on the roof of a clinic in Lahore, Pak., in 1952, as part of a government campaign developed with U.N. aid for expanding training in obstetrics and gynaecology

to cause critical damage to the eyes, ears or brain. Any acute infectious condition might be a hazard to the mother and the unborn baby, but rubella was a special one. Gonococcal infection might infect the newborn's eyes, and since it once was the principal cause of blindness, many states required that a 1% solution of silver nitrate be dropped into the eyes of the newborn. Trials of penicillin were still not accepted by state boards of health as a substitute. It had been argued that the dropping of a solution of 1% silver nitrate into the eyes might affect the eye surface, but this was not proven.

Another cause of concern was the loss of pregnancies before the period of viability (approximately a 28-week pregnancy or older). Usually these occurred within the first three months. The lay term is miscarriage. Scientifically, they were accidental abortions. These spontaneous abortions occurred mostly because of abnormal development of the fetus. Such abnormality occurred because either the male or female factor was imperfect.

Little was known about the prevention of serious anomalies and malformation of the baby, excepting that they occurred less often in the babies of the younger married couples. The risk is slightly greater in women over 35 years of age and greater still after the age of 40. The theory of explanation was based on a deficiency or fault in the ovum or the spermatozoon which fertilized the egg. The infertility problems of 1952 were more definitely crystallized. Normal body health was an important factor. The sensitization factor of erythroblastosis continued as a problem because not one specific prophylactic or therapeutic agent was discovered. On a statistical basis, only a very small percentage of babies born of Rh women who had Rh positive husbands showed sensitization. When these babies were born they were treated with a replacement of blood until their own blood system was able to take over.

The year saw real strides in lay education on the normalcy of confinement. When prospective mothers found that labour was not intolerable and that satisfactory relief could be given, fear vanished. Many women went through labour with little or no sedative. Excessive sedation was not popular. If analgesia (pain relief) was needed, judicious use was the practice. This reduced the danger to the baby. Hypnosis was still unpopular and not especially practical. A combination of drugs for analgesia gave the best result. Methadone, demerol or morphine, combined with scopolamine, ranked in first order in many institutions. Gases (ethylene, cyclopropane and nitrous oxide), ether, and low spinal injections were also used. In some warm or hot localities chloroform was used. Intravenous anaesthetics were not used for short duration procedures. Every year an occasional death results from some type of anaesthetic agent in both spinal and inhalation anaesthetics. Thus, the ideal anaesthetic agent for maternity was still undiscovered.

Special classes became more and more popular with the prospective mother to answer her everyday questions of hospital routines, equipment for the baby, and numerous other points. Classes for fathers continued to be popular. In these the husband obtained facts and corrected misinformation about pregnancy, labour, and care of the mother and baby after delivery.

Early ambulation, getting up early after childbirth, continued to be a worth-while practice. It helped the patients to retain their strength and keep up their good morale, but retention in the hospital for eight to ten days enhanced recovery and convalescence. This practice prevented relaxation of the genital walls.

Rooming-in, which had been tried in some areas, was waning in popularity. It favoured the acquaintanceship of mother and baby, but too often it disturbed the mother's night rest. The psychological and emotional values justified the effort to a reasonable limit. On the other hand, some mothers, after a few

hours or days with the baby, appreciated having it returned to a centralized nursery where they knew that it was under constant supervision.

The science of female disease continued to advance. Venereal disease was a problem in both the pregnant and the nonpregnant, but the rate was low. The routine test for syphilis prior to marriage was a highly desirable public health measure. Gonorrhoeal infections had increased slightly over the previous year or so, but to no major degree. The other venereal diseases, lymphogranuloma venereum, granuloma inguinale and chancroid, were significantly low, but not completely eradicated.

Diagnostic procedures remained an active part of gynaecological practice. These included a thorough bimanual examination as well as a general physical evaluation, because there were certain conditions that could be associated with abnormal pelvic behaviours. For instance, there was a tendency for abnormal menstruation in pulmonary tuberculosis in the age group from adolescence to 25 years. The menstrual alteration was the first symptom in 25% of the group. Sometimes blood conditions predisposed to excessive menstrual periods because of abnormal clotting and bleeding tendency. A severe genital itch might be associated with an uncontrolled diabetes which enhances a genital mycosis. Thus, the gynaecological approach was thoroughly diagnostic. Diagnostic steps were evaluated for the early recognition of genital cancer.

Emphasis was placed upon differential diagnosis in gynaecological practice, particularly with respect to backache and lower abdominal pain, and the proper interpretation. Infections of the pelvis might produce these symptoms but a large percentage of patients who had pain in the lower abdomen were more likely to have it because of other conditions. Backache was commonly caused by vertebral or muscle stress or injury. Thus, the need for accuracy was evident. The counterpart of gynaecological surgery is medical management. This includes the management of painful periods (dysmenorrhoea), both the psychosomatic and organic causes, irregularities of menstruation in young girls, and sterility and infertility. It requires a thorough study of the entire individual, and in sterility it also calls for a careful evaluation of the husband.

Treatment of cancer of the uterus and cervix was in the re-evaluation phase. However, the utilization of X-ray and radium for cervical cancer, and X-ray and radium and surgical removal of uterine cancer, remained the reliable and dependable procedures for these two conditions. The use of radioactive material, such as cobalt, gold or other agents, was investigated. The use of extensive surgery in early lesions of the cervix as well as the uterus received more attention. The role of very extensive surgery and wide resections for advanced pelvic cancer was practised to some degree. This latter procedure was reserved for those cancer cases where the disease was beyond the reach of X-ray and radium.

Hormone therapy continued in the state of further investigation, particularly so for the newer hormones. Thyroid extract remained of proven value in a fair percentage of sterility problems. Estrogens were the dependable agents in the relief of menopausal syndromes (nervousness, irritability, hot flashes). It was the practice generally in the year to give estrogens only after cessation of menstruation, and then only when there were sufficient symptoms to justify the therapy. Premature administration of estrogens tended to prolong the menopausal syndrome.

There was the perennial problem of discovering a better treatment for vaginal trichomoniasis. A specific cure was not found.

The year 1952 was fruitful in scientific progress but it left many avenues in obstetrics and gynaecology unsolved. These included the cause and more specific therapy of endometriosis (abnormal location of the lining of the womb).

Haiti. Although the Republic of Haiti has about half the area of Hispaniola, it has almost 50% more population. On about 10,748 sq.mi., Haiti's first census (Aug. 7, 1950) disclosed a total of 3,111,973, with 142,840 in the capital, Port-au-Prince, 4,975 in Cap Haïtien, 13,534 in Gonaïves, and 11,835 in Les Cayes. The fertile soil of the western valleys of the island, and the favourable climate make possible a high density of population, particularly since it is more than four-fifths rural. Probably not more than 5% of the population is predominantly of European origin; the rest is predominantly Afro-American. French is the official language. The president in 1952 was Paul E. Magloire.

History.—The foreign and domestic relations of Haiti in 1952 were unruffled. The economic factors were unchanged. World demand for Haiti's principal products showed no decline; most of the sugar, coffee, sisal and hardwoods produced went abroad. The reduction in public debt continued, notwithstanding an expansion in the program of road construction and irrigation of the Artibonite valley.

Price levels slowly rose during 1952, but employment remained high, and aggregate trade appeared likely to exceed any previous year in the century.

The improvement of harbour facilities and inland transportation continued to preoccupy the government. Experts from the staff of the United Nations, as well as others, were being sought to round out technical programs, particularly in the promotion of new industries and the training of students who could be used in administrative and supervisory work of the general program designed to lift the national standard of living.

Several trade missions from European countries visited the republic during the year. In the field of education, important additions were made to the secondary and vocational schools, particularly in the field of agronomy. (C. E. Mc.)

Education.—Haiti in 1949 had about 1,060 primary schools attended by 87,000 pupils, and 6 national *lycées* and 15 private secondary schools attended by about 10,000 pupils. Higher education was available at the national law and medical schools, the Central School of Agriculture and the government-controlled University of Haiti. In the 1950-51 fiscal year 60% of government expenditures were for public education. The 13 motion-picture theatres in 1951 had a seating capacity of 5,150.

Finance.—The monetary unit is the gourde, valued in 1952 at 20 cents U.S. currency, official rate. Actual government expenditure in the fiscal year ended Sept. 30, 1951, was \$24,361,830; revenue was \$25,041,543. The ordinary budget for the fiscal year 1952 balanced expenditure and revenue at \$24,884,750. The capital budget, to finance a five-year plan of economic development, was placed at \$40,000,000. The net public debt was \$6,221,167 on Feb. 28, 1952, almost entirely internal.

Trade and Communications.—Exports in the trade year 1951 (Oct. 1, 1950-Sept. 30, 1951) were \$49,595,647; imports were \$44,507,027. The chief exports were coffee (52%), sisal (24%), sugar (14%), cacao (3%) and rice (2%); leading imports were cotton manufactures (23%), wheat flour (9%), machinery and apparatus (9%) and iron and steel and products (8%). Leading suppliers were the U.S. (73%), Canada (5%), the United Kingdom (5%) and the Netherlands Antilles (3%); leading customers, the U.S. (59%), Belgium (18%), the Netherlands Antilles (7%), Italy (6%) and the Netherlands (6%).

On Jan. 1, 1950, there were about 2,000 mi. of improved roads, of which only about 245 mi. were surfaced. 88 mi. of public railway and 75 mi. of industrial trackage. In 1951 there were 9 short-wave and 2 long-wave broadcasting stations, 3,683 licensed radio sets and at least as many more sets operating without licence.

Agriculture.—Exports of coffee totalled 28,026 short tons in the trade year 1950-51. Other exports included sugar 37,927 short tons; sisal 34,452 short tons; cacao 2,177 short tons; and raw cotton 585 short tons. Exports of essential oils included vetiver 45,598 lb.; lemon grass 195,769 lb.; and oil of lemon 18,400 lb. Livestock (1945) included 200,250 cattle, 13,800 sheep and 1,010,000 goats.

Manufactures.—The only important sugar mill, operated by the Haitian-American Sugar company near Port-au-Prince, produced 62,247 short tons of sugar and 3,027,625 gal. of molasses in 1951. (J. W. Mw.)

Hammer Throw: see TRACK AND FIELD SPORTS.

Handball. The Detroit, Mich., Y.M.C.A. was the host club in 1952 for the annual U.S. national four-wall handball championships. As a consequence of the schism which had occurred the year before, the 1952 tournament was held in March under the auspices of the Amateur Athletic union in conjunction with the Amateur Handball union, which had formed in 1951 in Chicago, Ill. With the opposing factions brought together, all the leading players participated. The results were:

SINGLES

First Victor Hershkovitz, Brooklyn, N.Y.
Second.... Ken Schneider, Chicago, Ill.
Third Robert Brady, San Francisco, Calif.

DOUBLES

First Frank Coyle and William Baier, Chicago, Ill.
Second.... Sam Haber and Pat Cannon, Chicago, Ill.
Third Leo Dressler and Dan Kienlen, Chicago, Ill.

(Fr. Ro.)

Harriman, Averell (1891-), U.S. government official, was born on Nov. 15 in New York city. He graduated from Yale university in 1913, two years later became a vice-president of the Union Pacific Railroad company and in 1932 was named chairman of that company's board of directors. During World War I he organized a shipbuilding and operating company, and in 1920 launched W. W. Harriman Co., investment bankers, a firm that became Brown Brothers Harriman & Co. in 1931. He served as administrative officer in the National Recovery administration, and during 1940 and 1941 served with the National Defense Advisory commission and its successor, the Office of Production Management. In 1941 Pres. Franklin D. Roosevelt named him lend-lease expediter to Great Britain and later to the U.S.S.R. He was U.S. ambassador to the U.S.S.R. from Oct. 1943 to Feb. 1946, and he attended every major Allied conference during World War II. On April 1, 1946, Pres. Harry S. Truman named him ambassador to Great Britain, and on Oct. 7, 1946, secretary of commerce. In April 1948 he was named special U.S. representative abroad to supervise the administration of the European Recovery program, and he later became special presidential adviser on foreign affairs. In July 1951 President Truman named him special envoy to Iran, to try to bring about new conferences between Iran and Britain looking toward the settlement of the crisis created by Iran's nationalization of its petroleum industry.

Following Harry S. Truman's withdrawal from the presidential race on March 29, 1952, Harriman immediately became a leading contender for the Democratic nomination and formally announced his candidacy on April 22. At the convention in Chicago in July he received 123½ votes on the first ballot and 121 on the second; he then withdrew and transferred his support to Adlai E. Stevenson.

Harrison, William K., Jr. (1895-), U.S. army officer, was born on Sept. 7 at Washington, D.C. He was graduated from the U.S. Military academy, West Point, N.Y., in 1917 and from the Cavalry school, Fort Riley, Kan., in 1923, advancing subsequently through the grades to the rank of major general. From 1939 to 1942 he served on the army's general staff in Washington, D.C., and in the latter year became assistant commander of the 78th infantry division, later going overseas as assistant commander of the 30th division. Subsequently he was named commander of the U.S. 2nd infantry division in Europe. He arrived in Korea on Jan. 2, 1952, as deputy commander of the 8th army and

three weeks later was appointed a member of the United Nations truce team at Panmunjom. On May 19 he was named chief of the U.N. negotiators by Gen. Mark W. Clark to succeed Vice Adm. Charles T. Joy. The protracted series of meetings and recesses dragged on through the rest of the spring and summer and on Oct. 8 were recessed indefinitely. (See KOREAN WAR.)

Hawaii. The territory of Hawaii consists of a group of eight large islands and numerous islets in the Pacific ocean between latitudes 18° 55' and 22° 15' N. and between 154° 50' and 160° 30' W. longitude. The total area of the group is 6,433 sq.mi. From southeast to northwest, the islands are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai and Niihau. In addition, stretching northward beyond Niihau more than 1,100 mi., is an archipelago of rocks, reefs and shoals which includes Midway (longitude 177° 22' W.). Likewise, 960 mi. S. of Honolulu and included as part of the city and county of Honolulu lies Palmyra, a coral atoll consisting of 55 islets, 5 mi. long and 2½ mi. wide. The largest island in the territory is Hawaii, with an area of 4,021 sq.mi. The capital of the territory is Honolulu, situated on the island of Oahu. Honolulu is a modern city with a population of 232,553 as of July 1, 1952.

The population of the entire territory was 465,325, as of July 1, 1952, exclusive of military and naval personnel. The population of the territory is cosmopolitan, the Japanese and Caucasian groups being the largest. Other groups include native Hawaiians and part Hawaiians, Chinese, Filipinos, Koreans, Puerto Ricans and Samoans.

History.—The Hawaiian Islands has been a territory of the United States since 1900. Since that date the territory has repeatedly sought to become a state. A statehood bill was shelved by the second session of the 82nd congress of the United States during 1952.

On April 1, 1952, a bill of the 82nd congress was approved permitting women to serve on juries in the territory.

Gov. Oren E. Long, who began the second year of his term in May 1952, was appointed for four years by Pres. Harry S. Truman. Joseph R. Farrington filled the office of Hawaii's delegate to the United States congress in 1952. The delegate is elected every two years.

Education.—During the school year 1951-52 there were 194 public and 106 private schools, including kindergartens and schools through the 12th grade. Of the 121,638 students enrolled in the 12th grade and below, 97,240 attended public schools. The number of teachers in the public schools was 3,952, and in the private schools, 1,122.

The public schools of the territory below university level are all under the department of public instruction. The sum of \$12,895,450 was appropriated by the territory for public instruction for 1951-52.

There were 3 prisons and 3 reformatories, 1951-52. The average number of inmates of the prisons was 582; reformatories, 180. Expenditures were \$856,241 for the former and \$599,837 for the latter.

Public Assistance.—The following table shows the average number of persons assisted monthly and the expenditures during the fiscal year 1951-52 by the department of public welfare of the territory, excluding administrative costs:

Type of assistance	Average number of persons assisted monthly during fiscal year 1951-52	Expenditures for fiscal year 1951-52
Old age	2,255	\$ 894,603.69
Blind	114	53,334.11
Dependent children and their parents	12,623	3,169,088.97
Children under foster care	1,082	496,530.33
Disabled persons	1,140	535,654.10
General assistance	2,001	1,320,799.33
Total public welfare expenditures		\$6,470,010.53

Unemployment benefit payments totalled \$1,970,836 during the fiscal year 1951-52; total claims amounted to 161,384, a decrease of 5.1% from the previous year when the total was 170,017.

Transportation and Communications.—There were 155,605 motor vehicles in the territory, Dec. 31, 1951. Public roads including both rural and urban paved highways and streets approximated 2,180 mi.

During the fiscal year 1951, 941 overseas vessels arrived and departed from Honolulu harbour. Overseas incoming freight was 2,338,093 tons; overseas outgoing freight, 660,671 tons.

Sixteen airports were in operation during 1952.

On Dec. 31, 1951, 109,329 telephones were in use in the territory. Of the 12 commercial radio stations in the territory, 6 were in operation in Honolulu.

Banking and Finance.—In 1951 bank clearings amounted to \$2,081,698.82. Forty-four banks, including branches, were in operation in the territory. Combined deposits totalled \$376,329,868.97, while assets totalled \$411,938,043.43. Territorial government cost payments for the fiscal year 1951-52 amounted to \$75,889,017.22; the bonded indebtedness of the territory was \$42,800,000.

The net assessed valuation of real property was \$630,491,607 for the calendar year 1952; the average rate of real property tax was \$18.00. For the fiscal year 1951-52 total collections by the territorial tax office were \$76,683,076. Federal internal revenue collections amounted to \$13,608,839.73, an increase of \$3,697,801.58 over that of the previous year.

Production.—Sugar is Hawaii's principal industry and the value of 995,759 tons produced in 1951 was approximately \$136,052,000. About 221,210 ac. of land were utilized for sugar cane production. Pineapples were grown on 73,600 ac. of land to produce a pack of 26,075,606 cases of fruit and juice which was valued at \$100,000,000. The coffee crop in 1951-52 was approximately 6,000,000 lb. valued at \$2,800,000. The catch of fish totalled 19,219,884 lb. valued at \$3,963,614.09. The value of other fruits, vegetables and miscellaneous crops was approximately \$10,400,000, while the value of livestock, poultry and bee products was \$24,700,000. (O. E. L.)

Mineral Production.—Hawaii has little in the way of mineral production outside of building materials. In 1949 the output included 8,404 short tons of lime (\$226,926), 653,890 tons of stone (\$718,705), and other nonmetallics valued at \$42,896; total value \$988,457. In 1950 lime production was 8,141 tons (\$219,861) and stone 696,310 tons (\$1,544,966); total value \$1,774,767. Data for 1951 were not yet available.

Hay. The U.S. hay crop of 1952 consisted of 103,858,000 tons of all hays, slightly above the 101,072,000-ton average for 1941-50, but about 5% smaller than the record crop of 1951. The 75,400,000 ac. of hay meadow was about average and 1% above 1951, but the yield was 1.38 tons per acre, compared with 1.45 tons in 1951 and a 1.36-ton average for 1941-50. Wisconsin was the leading producer with 8,883,000 tons, followed by Iowa, Minnesota and Nebraska.

Alfalfa hay acreage increased to 19,075,000 compared with an average of 15,562,000 ac. for the previous decade. The yield of 2.2 tons per acre was less than the 2.26 tons of 1951. The crop amounted to 42,040,000 tons, whereas 1951 gave 42,937,000 tons. Wisconsin was the leading alfalfa hay state, closely followed by California and Minnesota. About one-third of the hay crop was clover and timothy. Wild hay constituted fully 10% of the total. Lespedeza, mostly produced in the southern drought area, was 5,895,000 tons, compared with 7,479,000 tons in 1951.

Hay prices averaged \$25 per ton to farmers in September, nearly \$4 more per ton than a year earlier. Prices, ranging between \$28 and \$36 per ton for specific kinds of hay were declared to be fair prices for hay in the deficit drought areas. Beyond those amounts the government would subsidize the cost.

Hay and Pasture Seeds.—Production in 1952 of 23 legume and grass seeds was indicated at 596,000,000 lb., 21% higher than in 1951 and 4% more than the average for 1941-50. Clover seed production (152,000,000 lb.) was about average, but 10% less than in 1951. Carryover stocks of old seed were above average, but one-eighth below 1951. (J. K. R.)

Hayden, Carl (Trumbull) (1877-), U.S. senator. He was born on Oct. 2 at Hayden's Ferry (later renamed Tempe), Ariz. He graduated from the Normal School of Arizona at Tempe and later attended Stanford university, Stanford, Calif. (1896-1900). After occupying various local and county offices in Arizona, he was elected to the U.S. house of representatives upon admission of Arizona to the union, serving consecutively from 1912 to 1927 as congressman at large from his state. He was elected U.S. senator from Arizona on the Democratic ticket in 1926 for the term 1927-33 and was re-elected four times, the last time in 1950 for the term 1951-57. In the senate he became known for his advocacy of federal aid to highways and irrigation projects, and he generally supported the administration policies of Franklin D. Roosevelt and Harry S. Truman. Hayden also became known for his taciturnity as a senator, having made only three speeches in the senate during

his quarter-century of tenure of office up to 1952.

Health, Industrial: see INDUSTRIAL HEALTH.

Hearing. In 1952 there were millions of people in the United States with some degree of hearing impairment, but it was impossible to estimate accurately the number with significant disability. It was estimated that there were about 100,000 individuals who were totally deaf, of whom about 51.3% were males and 48.7% were females. Negroes constituted only about 7.4% of the deaf population, with whites comprising 91.4%.

The fact that Negroes constituted 9.7% of the general population and whites 88.77% indicated that there was relatively less deafness among Negroes than in the white population.

It was thought that there were in 1952 between 3,000,000 and 5,000,000 school children with significant hearing disability. Various surveys revealed that in every schoolroom there were from two to five children with hearing loss. In 1950-51 there were 75 public residential schools for the deaf which had a total enrolment of 13,795. Of this number, 7,464 were males and 6,331 were females. The total number of educational staff members in these schools was 2,209. The number of public day schools for the deaf was 178, with a total enrolment of 5,884. Males numbered 3,141 and females 2,743. The educational staffs included 714 persons. There were 48 denominational and private schools for the deaf with a total enrolment of 1,802 and staffs numbering 346.

Many states, counties and cities had instituted testing programs in the schools. The Committee on the Conservation of Hearing of the American Academy of Ophthalmology and Otolaryngology suggested two types of testing. The first advocated the testing of each school child every third year. These tests were given in the primary, third, sixth and ninth grades. In addition, tests were given to children from other grades who were being given otological treatment, or whose previous tests showed borderline hearing impairment.

Additional tests were administered to children with speech defects, and to those whose teachers suspected hearing losses since the last examination.

Another method consisted of testing each pupil in all grades every three years.

Testing the hearing of the preschool child is a very important but extremely difficult task. Testing with the pure tone audiometer, standard for adults, is not appropriate for the preschool child. It requires a subjective response concerning the sounds he hears. He may, however, be taught to respond to noisemakers of various pitch and loudness levels.

Another method of testing his hearing is the development of the conditioned reflex which records changes in skin resistance, following mild electric shock. A sound is presented followed a few seconds later by an electric shock. The child is conditioned to develop skin resistance changes, in response to the sound, in anticipation of the coming shock. When he begins to respond with regularity to the sound, its loudness is reduced until the threshold is reached.

Psychogalvanic skin response audiometry, to be successful, must be administered by a thoroughly trained and experienced testing team. The interpretation of the results of such tests must be read by trained and experienced clinicians. This test was still in the early stages of development and had to undergo more investigation clinically and experimentally before it could be placed in general use.

The Committee on the Conservation of Hearing had been doing a great deal of work in the field of industry, endeavouring to determine the incidence and prevention of "occupational deaf-

OUTPATIENT WORK in the Clinic and Research centre opened in 1952 as part of the Central Institute for the Deaf in St. Louis, Mo. A child was being given speech lessons as his mother watched and learned how to continue the work at home (in foreground are student teachers observing)

ness." There was general acceptance of the fact that high-level noise to which human ears are exposed for certain lengths of time can produce a loss of hearing acuity. This phenomenon is encountered for the most part in the field of general industry, and is a problem of such stature as to affect a great many people.

The following three aspects of the problem were receiving attention: (1) the determination of onset and rate of progression in hearing loss resulting from industrial noise; (2) the study of the characteristics of efficient ear protectors; (3) the detection of the individual who is hypersusceptible to noise-induced hearing loss.

A great deal had been done in the past few years to aid patients with otosclerosis. The fenestration operation had completely rehabilitated great numbers of those whose hearing loss was caused by clinical otosclerosis. The operation had developed into a delicate procedure to create a new window through which sound passes from the outer ear to the hearing nerve. Until the operation became a safe, practical and effective technique, medical science had no successful treatment for this type of hearing loss, and could only prescribe a hearing aid.

In most cases the patient's hearing improved to a level of practical serviceability after a fenestration operation, making a hearing aid unnecessary. In a few cases the hearing returned to the preoperative level, and in others hearing retrogressed according to the ravages of age on the ear tissues, and the natural, predestinate degeneration of the hearing nerve.

It had been learned that individuals with impairments resulting from pathology of the middle ear usually obtain excellent results with hearing aids. Some individuals with cochlear pathology and many with neural pathology also obtain gratifying results. (See also EAR, NOSE AND THROAT, DISEASES OF.)

(D. LE.)

TEAM OF DOCTORS, social worker and job analyst discussing a cardiac case at the Work Classification clinic of the Cleveland Area Heart society in 1952. The clinic helped to return patients to work that was safe for them, without total loss of their work experience to employers

Heart and Heart Diseases. In the fall of 1952, the Fourth Inter-American Cardiology congress was held in Buenos Aires, Arg. There were 319 papers presented, many of them showing the active research taking place in Latin America. Cardiac conditions peculiar to these countries were extensively studied, such as the effects of Chagas disease in Brazil and of living at high altitudes in the Andes, as well as the fundamental mechanisms of atherosclerosis and hypertension. The first congress of the European Society of Cardiology was held in London.

In the United States, from 1920 to 1947 the death rate of white males from cardiovascular disease in the age period from 35 to 65 years had approximately doubled, while that of the white female had declined. This unexplained rise in the death rate of the male at the most productive age raised serious economic and social questions.

Basic research in the fields of biochemistry, nutrition and pathology contributed to cardiovascular knowledge, as in the report of the vitamin factors necessary for the utilization of foodstuffs by the heart—niacin, folic acid, pantothenic acid, biotin and pyridoxine.

The relief of sufferers from cyanotic congenital heart disease by surgery began to show interesting results, such as the ability of women so treated to bear normal children, even after they had had congenitally deformed children from pregnancies occurring when they were cyanotic prior to operation.

R. C. Brock of London, Eng., reported an impressive series of 240 operations for congenital pulmonic stenosis, and repair of interauricular septal defects was successfully accomplished by a new technique.

Rheumatic heart disease became related once more to an allergic status by the finding of analogous leucocyte-platelet thrombi in the small blood vessels in active rheumatic fever, similar to those in the skin lesions in the Arthus and Schwartzman phenomena.

The influence of the steroid hormones on the rheumatic state

was intensively investigated. Some reports indicated that they were no more valuable than salicylates, and it was also suggested that the salicylates work through the pituitary adrenal mechanism.

Surgical opening of the stenosed mitral valve of chronic rheumatic heart disease became widely employed throughout the world with improved mortality figures, as well as less danger from operative embolism by such procedures as allowing free bleeding from the auricle and intermittent occlusion of the circulation to the brain during manipulation of the auricle and mitral valve.

Hypertension was studied in many centres throughout the world. The major therapy was medical, with such drugs as protervatrine, hexamethonium, pentamethonium, 1-hydrazinophthalazine and Rauwolfia Serpentina.

Coronary artery disease, the most common manifestation of atherosclerosis, was investigated with increasing vigour. Previous observations on the ability of heparin to clear the milkiness of blood plasma occurring after a fat meal led to the therapeutic use of this substance in patients with angina pectoris with inconsistent results. However, it was shown that it takes part in the complex action of a "tissue factor," which acting with heparin produces a "clearing factor," which in turn acts with a coprotein to reduce the turbidity of plasma and the concentration of the special lipoproteins considered significant in the production of atherosclerosis. It was of interest to note that the rat, the animal notably free from atheroma, was the most responsive of experimental animals in the ability to produce this "clearing factor" with heparin.

Emphasis remained on abnormal fat metabolism as the cause of human atherosclerosis, although the significance of ingestion versus synthesis of fats remained unsolved. A. Keys and his co-workers in a study in Italy added more information about the influence of diet. In several groups surveyed in the United States, England and Denmark it had been shown that in 1949 fat in the diet supplied 38%, 32% and 34% of calories, respectively, and that serum cholesterol rose steadily with age. In Naples, where fat furnished only 20% of total calories, the serum cholesterol in a group of normal men rose with age to

a level in the 30s comparable with that in the previous groups, but thereafter remained at the same height and did not reach the levels characteristic of those in the age periods of greatest incidence of coronary disease in the other countries mentioned. Italy was said to be relatively freer of coronary disease.

Another contribution of importance was the observation in chickens that estrogens had a protective influence against coronary atherosclerosis produced by high cholesterol feedings.

Hobby, Oveta Culp (1905-), U.S. lawyer and newspaper executive, was born on Jan. 19 in Killeen, Tex. She was a graduate of the University of Texas law school, a member of the Texas legislature, assistant city attorney of Houston and a bank director. She helped codify Texas banking laws and was the author of a text on parliamentary law. In 1931 she married William Pettus Hobby, former governor of Texas, and took an active interest in his newspaper, the *Houston Post*, becoming executive vice-president.

She was called to Washington, D.C., on a dollar-a-year job as chief of the women's interests section of the war department's public relations bureau (1941), drafted plans for a women's army and on May 16, 1942, was sworn in as director of the first force of this kind in U.S. history, with a rank equivalent to that of major. In July 1943, the women's army corps (WAC) became an integral part of the army. Mrs. Hobby, as colonel, continued in command.

She resigned her army commission in 1945 and returned to her position as director and executive vice-president with the *Houston Post*. On Nov. 25 she was selected as administrator of the Federal Security agency by President-elect Dwight D. Eisenhower.

Hockey, Field. The sport showed a distinct gain in popularity among United States women in 1952, a number of schools and colleges adding the game to their extra-curricular programs. Gains also were made by club teams, with the Pacific southwest and midwest groups leading in the upswing reported by the U.S. Field Hockey association. The outstanding contest of the year among feminine competitors took place at the Wembley stadium in London on March 8, when an English team turned back Scotland 9-2, before 45,000 spectators. Stadium officials said it was a world record attendance for field hockey.

India continued its domination of men's competition and captured its fifth straight Olympic games championship by routing a team representing the Netherlands, 6-1, in the final round at Helsinki, Fin. Great Britain beat Pakistan 2-1, in a hard-fought battle for third place in the standings. The U.S. was not represented in the Olympic contests. (T. V. H.)

Hockey, Ice Detroit's Red Wings, after winning the 1952 championship of the National Hockey league in easy fashion, set a blistering pace to capture eight straight play-offs and annex the Stanley cup, symbol of world supremacy. The Wings yielded only three goals in all as they eliminated Toronto, the cup defenders, in the semifinal round, 3-0, 1-0, 6-2 and 3-1. Meanwhile, the Montreal Canadiens and the Boston Bruins were locked in a torrid semifinal series, which went to a seventh game before Montreal won the right to battle the Wings in the ultimate round.

In the Stanley cup play, Detroit triumphed in the opening cup battle, 3-1, as Tony Leswick scored twice and Ted Lindsay once, and annexed the second contest, 2-1, on a tie-breaking shot by Lindsay. Goalie Terry Sawchuk was at his best in the third engagement and the Wings triumphed by 3-0, Gordie Howe counting twice and Lindsay once. Detroit then became the first team in history to win eight straight games in a Stanley cup series when they shut out the Canadiens, 3-0, to take the trophy. Sawchuk equalled the Stanley cup record with his fourth shut-out of the series. Metro Prystai tallied two goals and Glen Skov one to bring victory to the Wings.

Gordie Howe, with 86 points, tied his own National league record to lead that circuit in scoring for the second straight year and to win the Hart trophy as the most valuable player for the 1951-52 campaign. Sid Smith of Toronto received the Lady Byng Memorial trophy for good sportsmanship combined with playing ability. Sawchuk captured the Vezina trophy as the goalie allowing the fewest goals and Bernie Geoffrion of Montreal won the Calder trophy as the season's outstanding rookie.

The annual game between the first and second All Star teams, played at Detroit's Olympia, resulted in a 1-1 tie, with Maurice Richard of Montreal and Marty Pavelich of Detroit accounting for the tallies.

The Pittsburgh (Pa.) Hornets won laurels in the American league and the Saskatoon Quakers finished first in the Pacific Coast league. The Johnstown (Pa.) Jets were double title winners, triumphing in the senior division of the Amateur Hockey association of the United States and the Eastern league, while

OLYMPIC HOCKEY MATCH between the Canadian and Czechoslovak teams, played at Oslo, Nor., in Feb. 1952. Goalie Ralph Hansch of the Canadian team (right foreground) is shown trying to block the puck

the Toledo (O.) Mercurys carried off the International league championship. The Hibbing (Minn.) sextet took national Amateur Athletic union laurels and Canada came through on top in the world amateur tourney.

England won the Churchill cup at Wembley, Eng., by defeating Canada and the United States in triangular competition among Olympic teams of those three countries.

The University of Michigan retained its title in the National Collegiate Athletic association contests at Colorado Springs, Colo., by defeating Colorado college, 4-1, in the final round. Yale set back St. Lawrence, 4-1, in a battle between the beaten semifinalists for third place in the tournament. (T. V. H.)

Hoffman, Paul Gray (1891-), president of the Ford foundation, was born on April 26 in Chicago, Ill., and studied at The University of Chicago. In 1911 he became a salesman for a Studebaker dealer in Los Angeles, Calif., and later was sales manager and then district branch manager for Studebaker in that city. After serving in World War I he purchased the Studebaker retail branch in Los Angeles, and in 1925 he went to South Bend, Ind., as vice-president of the Studebaker company. In 1933 he and Harold Vance, another vice-president, as receivers successfully reorganized the company and Hoffman served as Studebaker president from 1935 to 1948. He was an organizer of the Committee for Economic Development and chairman of its board of trustees from 1942 to 1948. On April 5, 1948, Pres. Harry S. Truman appointed Hoffman administrator of the Economic Cooperation administration. He supervised the European Recovery program (ERP) until his resignation on Sept. 30, 1950.

His book, *Peace Can Be Won*, inspired by his experience as ECA administrator and the success of the recovery program, expressed his conviction that the U.S. could defeat communism by waging the peace on the military, economic, political and informational fronts.

The appointment of Hoffman as president of the Ford foundation, the largest public trust in the world, was announced on Nov. 6, 1950, and became effective on Jan. 1, 1951. He was enabled to continue his efforts for peace in his new post, since the foundation planned to concentrate initially on activities directed toward its primary objective, world peace.

One of the earliest supporters of Dwight D. Eisenhower for the Republican presidential nomination, Hoffman devoted much of his time in 1952 prior to the Chicago convention advancing the general's candidacy.

Home Economics. Membership in the American Home Economics association in 1952 included 19,643 professional memberships, 432 college clubs, 72 home-maker groups and 3 affiliated foreign associations.

During the year the association conducted a special American Home Economics association project in family life education supported by funds from the Grant Foundation, Inc.

The association granted two fellowships for graduate study and eight fellowships and scholarships to assist students from abroad to study home economics at United States colleges and universities. The association also co-operated in orientation programs for visitors from abroad.

Plans were made for participation in the eighth International Congress of Home Economics to be held in Edinburgh, Scot., Aug. 12 to 18, 1953.

Bureau of Human Nutrition and Home Economics.—Be-

cause diets are frequently low in calcium, the bureau analyzed 402 commercial white bread samples from 41 states to learn calcium content, and found a wide variation. An individual eating the city dweller's average amount of baker's white bread—1.44 lb. a week—could get as little as 1% of his recommended calcium allowance from bread or as much as 16%.

In experiments with rats the bureau sought information as to whether diet deficiencies worked greater hardship on one sex than on the other. Protein deficiency caused greater retardation in growth of young male rats than of female. However, when young rats received diets adequate in all respects, male rats gained more rapidly than female.

Six expansible farmhouse plans were designed by the bureau in co-operation with the bureau of plant industry, soils and agricultural engineering, to show relatively low-cost ways of building a basic living unit to which bedrooms might be added as the family grew or the budget permitted.

A *Food Guide for Older Folks* was issued as a much-requested addition to the series in which the bureau endeavored to apply the latest nutrition knowledge to everyday food management at different stages of the family life cycle.

Experiment Stations.—Research in home economics in the land-grant colleges is largely conducted as part of the research programs of the agricultural experiment stations established in connection with the colleges. These researches are supported in part by state and special funds and in part by federal grants administered through the office of experiment stations of the U.S. department of agriculture. During 1952 investigations were continued in the fields of family economics, family relationships, foods and nutrition, housing, home management, textiles and clothing and certain aspects of marketing.

Some of these investigations were fundamental in character others were applied. Certain researches concerned with farm housing problems and with consumption and nutritional status of selected population groups were conducted on the regional co-operative basis made possible through provisions of the Research and Marketing act of 1946.

Home Economics Extension Service.—More than 1,600,000 women reported that they had improved their families' diets by better selection, preparation and preservation of food through participation in the home demonstration program of their counties.

In addition, 13,400 schools were assisted in establishing and maintaining hot-lunch programs. About 300,000 families received help on housing improvements. About 287,000 women and 45,000 men participated in child development and family relations programs. Through 4-H club programs the service reached 1,000,000 girls. Approximately 3,400 white and 400 Negro home economists directed these county and community programs, with help from 600,000 volunteer local leaders.

Land Grant Colleges.—The home economics division in the Association of Land Grant Colleges and Universities directed its efforts during 1952 to the co-ordination of programs of resident instruction, extension and research. The resident instruction section was concerned with problems of enrolment, quality of instruction at the college level and counselling students in personal and professional development.

The extension section directed its efforts to the need of sensitizing farm women to their obligations as producers of food for the world. The research section was interested in promoting research that would improve the family and family life, in stating out areas of research in which home economics should assume leadership and in preparing these analyses in printed form.

Public Schools and Colleges.—Total enrolment in home economics in junior and senior high schools remained at about 1,750,000, with an increase in the number of classes in which

boys and girls together considered homemaking and family living problems. Adult enrolments in homemaking education classes continued high as homemakers sought help with meeting the high cost of living.

An increase of more than 10% in membership in the Future Homemakers of America and New Homemakers of America, national organizations of high school home economics students, brought the total number of members to 390,046 in 9,395 local chapters. National meetings of both organizations emphasized leadership training with special attention given to getting more member participation in decisions of the national organization.

Focusing homemaking teaching on the needs and problems of families was emphasized in home economics education at both the public school and college level during 1952. State curriculum planning groups made up of supervisors and teachers of homemaking worked on ways of making classroom activities, guided home experiences, and work of the Future and New Homemakers of America all contribute to better family living.

There were approximately 80,000 students enrolled in home economics at the college level with about 8,500 receiving bachelor's degrees during the year. A total of approximately 1,000 master's degrees and 90 doctor's degrees in home economics and home economics education were granted.

Home Rule, City: see MUNICIPAL GOVERNMENT.

Honduras. A republic of Central America, Honduras is bounded by Guatemala, El Salvador and Nicaragua. Area: 59,160 sq.mi. Pop. (1950 census of the Americas): 1,505,405, including approximately 35,000 tribal Indians. Capital: Tegucigalpa (pop. 62,263 in 1949). Other principal cities are San Pedro Sula (24,425), Comayagua (16,907), La Ceiba (13,456), Tela (11,544) and Puerto Cortés (8,837). Language: Spanish. Religion: predominantly Roman Catholic. President in 1952: Juan Manuel Gálvez.

History.—The political scene was relatively quiet in 1952. A \$10,000,000 bond issue for highway construction was approved by the congress in May. On June 1 it was announced that U.S. nationals travelling in Honduras would no longer be required to carry passports. Representatives of Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua met at Tegucigalpa on Aug. 23 to discuss ways and means of developing agricultural and industrial production, improving transportation and integrating the economies of the Central American republics. (G. I. B.)

Education.—In 1951 there were 2,061 primary schools with 106,438 pupils enrolled, 21 secondary schools with 1,107 students, 24 normal schools with 1,746 students and 14 commercial schools with 2,386 students. The National university at Tegucigalpa had 796 students in 5 faculties. The 1952-53 budget allocated 4,533,647 lempiras for education.

Finance.—The monetary unit is the lempira, officially valued at 49.5 cents U.S. currency in 1952. Governmental expenditures in the fiscal year 1950-51 totalled 35,220,982 lempiras; net revenue was 40,005,264 lempiras. The 1952-53 budget balanced revenue and expenditure at 34,509,434 lempiras. The internal debt amounted to 8,281,549 lempiras on June 30, 1951, of which 7,584,927 lempiras represented the floating debt. The external debt was 723,875 lempiras. Money in circulation on July 31, 1952 included 26,510,000 lempiras in Honduran notes and coin and \$1,227,775 in U.S. coin. The cost-of-living index (Tegucigalpa) stood at 133 on Aug. 31, 1952 (1948=100).

Trade and Communications.—Exports during the fiscal year 1950-51 amounted to 56,128,578 lempiras, which figure was unadjusted for banana undervaluation estimated at 101,400,000 lempiras by the International Monetary fund. Imports were valued at 78,895,337 lempiras. Chief exports were bananas (29%), coffee (21%) and pine lumber (9%). Chief customers were the U.S. (72%), El Salvador (13%), Cuba (5%) and Canada (3%); leading suppliers, the U.S. (74%), El Salvador (5%), the Netherlands Antilles (4%) and Mexico (3%).

In 1947 there were 922 mi. of railroad, confined to the northern banana area, 1,201 mi. of highway and 63 airfields. Motor vehicles on Jan. 1, 1951, included 1,733 cars and 1,583 trucks. There were 6 broadcasting stations and about 16,500 radio sets in 1950. On June 30, 1951, 152 vessels (100 tons and over) aggregating 508,172 gross tons were registered under the Honduran flag.

Agriculture.—Coffee production in the 1950-51 season totalled about 27,000,000 lb. Banana exports in the 1950-51 fiscal year totalled 12,727,926 stems, of which 11,029,034 stems went to the U.S., 1,547,000 to Canada and 151,692 to the Netherlands. Other exports in 1950-51 were coffee, 14,893,282 lb., and coconuts, 8,847,557 nuts. Forest exports included 1,784,722 bd.ft. of mahogany lumber and logs and 41,091,633 bd.ft. of pine.

Minerals.—In the fiscal year 1950-51, 31,137 troy ounces of gold amalgam and bars and 2,814,006 oz. of silver amalgam and bars were exported. (J. W. Mw.)

Honduras, British: see BRITISH HONDURAS.

Honey: see SUGAR.

Hong Kong. This British colony on the southeast coast of China consists of Hong Kong Island and the ceded territory of Kowloon and Stonecutter's Island. The New Territories (the rest of Kowloon peninsula and numerous islands) were leased from China in 1898 for 99 years. Area: colony 35.5 sq.mi., New Territories 355 sq.mi. Pop.: (1931 census) 849,751; (1951 est.) 2,013,000. Language: Chinese (Cantonese); about 5% speak English. Cities: Victoria (cap.; pop. c. 438,000); Kowloon (pop. 1931, 264,675). Governor in 1952: Sir Alexander Grantham.

History.—Hong Kong's trade fell month by month in the first half of 1952 to about 50% of the peak figure of March 1951. An upswing began in July, coinciding with the end of the Chinese government's campaign against the so-called "five evils" of private industrialists and merchants, and the efforts by that government to restore life to the country's industry and commerce. Another difficulty had been the U.S. customs' detention of consignments of local handicrafts on suspicion that they were made from materials from the Chinese mainland. In June Hong Kong's trade figures were the lowest since April 1950 and were nearly 38% below the 1951 monthly figure; but in July there was an increase of nearly 18% over June. The colony's trade with China, which fell from \$ 155,000,000 (Hong Kong dollars) in Aug. 1951 to \$ 68,000,000 in March 1952, recovered to \$ 123,000,000 in July. Up to the end of August total imports into Hong Kong were \$ 2,441,000,000 and exports \$ 1,800,000,000.

Following the judgment of the judicial committee of the privy council in favour of the U.S. air line Civil Air Transport, Inc., 40 of the aircraft grounded at Kaitak airport were handed over to that corporation. Chinese Communist caretakers, who had been permitted to take charge of them following the judgment of the local courts (set aside on appeal), staged a sit-down demonstration when the aircraft were removed. The remaining 31 aircraft, still the subject of litigation in the local courts, remained under control of the authorities.

CONTRABAND SHIPMENT of diesel oil and iron plates confiscated by British harbour police in Hong Kong. Junks were searched regularly for strategic materials being smuggled to Communist China in 1952

A special committee was set up to report to the government on the needs of technical and vocational education; another sent to the government its recommendations on additional higher-educational facilities, involving considerable expansion, including the provision of degree courses through the Chinese medium at Hong Kong university.

Education.—Registered schools (1952) 1,039; pupils c. 200,000. University of Hong Kong: students (1951-52) c. 700.

Finance and Trade.—Monetary unit: Hong Kong dollar, valued in 1952 at 17.5 cents U.S. Budget, 1951 (in Hong Kong dollars): revenue \$291,326,400, expenditure \$228,404,796. Estimated budget, 1952: revenue \$285,162,200, expenditure \$286,000,000. Foreign trade, 1951: imports \$4,892,000,000, including from China \$863,000,000, Macao \$103,600,000; exports \$4,460,000,000, including to China \$1,603,900,000, Macao \$228,350,000. (W. V. PL.)

Horse Racing. Hill Gail, three-year-old colt from Mrs. Warren Wright's Calumet farm, raced to a two-length victory in the Kentucky Derby at Louisville, Ky., on May 3, 1952, to earn \$96,300 of the gross purse of \$124,350. Following his score in the Santa Anita Derby in February, when he won \$92,900, Hill Gail was made favourite by the crowd of more than 100,000 that jammed Churchill Downs for the 78th running of the blue ribbon event of the U.S. turf. With Eddie Arcaro up, he led most of the way to defeat Sub Fleet, with Blue Man a distant third in the field of 16. The winner returned \$4.20, \$4.00 and \$3.20.

An ailing leg kept Hill Gail out of the Preakness Stakes at Pimlico in Baltimore, Md., on May 17 and that \$113,270 test was captured by Blue Man, owned by Arthur W. Abbott of Rye, N.Y. Ridden by Conn McCreary, the colt, after coming from

last place in a field of ten, added \$86,135 to the money he had earned since being bought for \$10,000 in January 1951. Blue Man returned \$5.20, \$3.40 and \$2.60.

One Count, with Arcaro riding, scored a surprise in the '84th and richest Belmont Stakes at Belmont park, L.I., June 7. The winner gained \$82,400 of the \$118,500 purse for Mrs. Walter M. Jeffords' stable. One Count, which paid bettors \$27.60, \$4.60 and \$2.80, finished with two and one-half lengths to spare over Blue Man, while Armageddon from the Cain Hoy stable was third. One Count added to his earnings with victories in the Jockey Club Gold Cup race at Belmont, Oct. 4, and the Empire Gold Cup race at Jamaica, Oct. 25. Dave Gorman was aboard the winner on both occasions.

Arcaro reached a new riding mark on Sept. 24 when he booted in the Calumet farm's Mark-Ye-Well in the Lawrence Realization at Belmont, being the first jockey to ride horses winning \$2,000,000 in a single year. Two other victorious rides and a fourth position the same day brought the total purses of his mounts to \$2,023,896.

The Arlington Classic on July 19 grossed \$150,450, making it the richest race ever held for three-year-olds, and again Arcaro was first with Mark-Ye-Well. The victor earned \$105,375 and it was the 26th stakes score of 1952 for Arcaro, tying Eddie's own record for the most stakes victories in one year. Mark-Ye-Well and Arcaro returned to Chicago on Aug. 9 and combined to annex the top purse of \$103,325 in the 42nd running of the American Derby at Washington park. Sub Fleet was second.

Crafty Admiral from the Charfran stable carried off the winning purse of \$119,900 in the Washington Park Handicap as the King Ranch's To Market finished two lengths behind. Crafty Admiral, with Arcaro up, also took the Whirlaway Handicap at Washington park, while Mr. Paradise, owned by Mrs. Ada L. Rice of Chicago, was first in the Washington Park Futurity when he was ridden by Arcaro. To Market from the King Ranch ran away with the Arlington Handicap on July 26, finishing ten lengths ahead of Oil Capitol. Calumet Farm's Two Lea triumphed in the \$137,100 Hollywood Gold Cup classic at Inglewood, Calif., July 12, beating Cyclotron by half a length.

Native Dancer stood out among the two-year-olds in a year that saw attendance and betting totals swing sharply upward at most tracks. Alfred Gwynne Vanderbilt retired the colt late in October after Native Dancer had won nine straight races, bringing his earnings to \$230,495 to surpass the juvenile record of \$219,000 set by Top Flight. One of the colt's outstanding victories came in the \$107,545 Futurity at Belmont park Sept. 27 when he equalled the world mark for six and one-half furlongs over a straight course, being clocked in 1 min. 14.4 sec.

Tony DeSpirito, an apprentice from Lawrence, Mass., was well ahead in the competition for most winners piloted in one year. DeSpirito went into November with a total of 316.

Trotting and pacing continued to grow in popularity, with attendance and betting figures soaring. William H. Cane's Good Time, the record money winner of harness racing, was retired in October after bringing his earnings for five years to \$318,792.86. Sharp Note, owned by C. W. Clark of Dearborn, Mich., triumphed in the 27th Hambletonian Stakes at Goshen, N.Y., Aug. 7. Driven by 74-year-old Bi Shively, Sharp Note finished tenth, then trotted two winning heats to annex \$47,236.64, victor's share of the \$87,637.55 purse. Hit Song, driven by H. Pownall, was runner-up with a first, third and second. Sharp Note later clinched the three-year-old trotting title for 1952 by taking the Kentucky Futurity at Lexington, Ky., Oct. 2, sending his 1952 earnings to \$101,175.70, a record for one year. Pronto Don of the Hayes Fair Acres stable, DuQuoin, Ill., became the third trotter ever to pass \$200,000 by annexing the Adelphi free-for-all mile at Roosevelt raceway June 14. Chris Spencer,

owned by Dunbar Bostwick, captured the \$50,000 Roosevelt two-mile trot on Sept. 11. Meadow Rice, property of W. G. Reynolds of Louisville, scored in the seventh annual Little Brown Jug racing at Delaware, Ohio, earning \$30,231.66 of the total purse of \$60,463.35. (T. V. H.)

Canada.—An amendment to the federal criminal code changed the graduated scale of percentages, ranging from 9% to 5%, that were retained by a racing association to a fixed rate of 9% of the total amount wagered on each race (thus conforming with the fixed-rate practice in the United States). Ontario reduced its pari-mutuel tax on race horse wagering from 19% to 17% in an attempt to curb illegal betting, and the cut applied to 1952 racing. For the first time a jockey club stock offering was made available to the general public when 900,000 shares of the Ontario Jockey club were put on the market. (C. Cy.)

Great Britain.—The Grand National at Aintree was won in 1952 by H. Lane's ten-year-old gelding Teal. Miss D. Paget's Mont Tremblant, a six-year-old, won the Cheltenham gold cup. Sir Ken, a year younger, owned by M. Kingsley, won the Champion Hurdle.

The keen rivalry between English and French owners for once went in favour of England. The Aga Khan and his English-trained three-year-old colt Tulyar broke all British records for stake money won in a season. Tulyar won all the seven races he contested and proved himself the best horse of his age in Europe. Among his successes were the Derby, the Eclipse stakes, the St. Leger and the King George VI and Queen Elizabeth stakes. The last-named was again the most valuable race in the calendar, worth £23,302 10s. in 1952. Tulyar's seven victories were worth £75,173 10s. in stake money, easily the most earned by a single horse in the history of racing in the British Isles.

M. E. Constant's Thunderhead II won the Two Thousand Guineas easily in an exceptionally large field for this race of 26.

The three-year-old fillies in England proved considerably

inferior to the colts.

Sir M. McAlpine's Zabara won the One Thousand Guineas, and Capt. A. M. Keith's Frieze took second place in the Oaks a month later. In France the corresponding races for fillies were won by G. Courtois's Pomare and by R. B. Strassburger's Seria. The best of the French three-year-old colts were A. Cutler's Orfeo, who won the Grand Prix de Paris; M. Boussac's Auriban, who had won the Prix du Jockey Club two weeks previously and was second two lengths behind Orfeo in the Grand Prix de Paris; and P. Duboscq's Feu de Diable, who in September won the Prix Royal Oak by eight lengths.

Though the three-year-old fillies in England were inferior to the colts, the two-year-old fillies were undoubtedly superior. The best was Bebe Grande, who won seven of her eight races.

A French-bred four-year-old, Aquino II, trained at Newmarket by F. Armstrong, won the Ascot gold cup and the Doncaster cup.

During the year racing in England found its tax reduced by about 15%. Entrance fees were cut by about the same amount, and the result was a general rise in attendances. (M. A. Md.)

Horses: see LIVESTOCK.

Horse Shows: see SHOWS.

Horticulture. Twenty-nine countries were represented at the International Horticultural congress, which opened in London, Eng., Sept. 9, 1952. The most important business was the provisional acceptance of a report on a code of nomenclature of cultivated plants as applied internationally. Action on the international registration of cultivated plants was deferred to the next congress, to be held in the Netherlands in 1955 or 1956. A report on conditions in England showed that yields from commercial horticulture had doubled since 1939, with but little increase in cultivated areas.

Announcement was made of an international gardening and flower show to be held in Hamburg, Ger., from May to October 1953.

The Netherlands had the best bulb crop since World War II, as a result of a long period of good weather. A sampling of reports from retail dealers in the U.S. indicated an expected bulb business of \$25,000,000. Oregon had a bumper crop of daffodils, but with a shrinking area resulting from foreign competition. Lily bulbs continued to be received from Japan in increasing numbers.

Northern Ireland lifted a ban on vegetables from the Netherlands and Spain, imposed because of foot-and-mouth disease. Yugoslavia and adjoining countries suffered heavy loss from drought, especially in vineyards. Argentina also suffered severely from drought, as did areas in central and south Africa. Rain came barely in time to save crops in Italy and parts of India. Locusts from east Africa threatened a complete loss of crops from Israel to India, but the plague finally was overcome through the use of aeroplanes and power sprayers from Great Britain and the U.S.

New England and other eastern states of the United States suffered the worst drought in 25 years, with heavy loss to market gardeners and amateurs, but the operators of irrigated farms got top prices. Because of the drought the apple crop was sharply reduced in the east, particularly in New England, with few apples for shipment abroad. Peach production was 10% below average for the U.S. as a whole, but slightly above average in the northeast. The pear crop was average, and grape production was 5% above average. The cranberry crop of 908,200 bbl. was slightly smaller than in 1951, but 18% above average. Only in the state of Washington was production below average. Pickers were hard to find and some Puerto Ricans were brought in for this work.

START OF THE 1952 Kentucky Derby at Churchill Downs, Louisville, Ky., won by Hill Gail (farthest from camera) on May 3

PRACTICE DAY in flower arranging for women of the Dorchester Floral Decoration society as they prepared for the first English "flower academy," held in London in the summer of 1952

The gold medal of the National Association of Gardeners was awarded Henry F. du Pont of Wilmington, Del., for outstanding contributions to horticulture. This award is made rarely.

The Society of American Florists voted to spend \$1,000,000 for a national marketing program.

The Dutch elm disease continued to spread rapidly in New England, with many communities finding it difficult to keep up with the needed removal of dying trees. It finally invaded the campus at Harvard university, Cambridge, Mass., where two fine old trees had to be removed. However, it was announced that the gypsy moth had been practically eliminated from Massachusetts where it had done great damage to evergreen trees. This was accomplished by spraying from planes, and other states were expected to follow this plan.

Nurserymen in the U.S. reported widespread interest in the planting of home grounds because of the great increase in home building. This followed a continuing reduction in the amount of landscape work being done on large estates.

In Australia the prices of some food stuffs went down during the year, but fruit and canned goods were higher and the announcement came that the country needed more fruit production. This was in spite of the fact that Australia's canned fruit production was 500,000 cases greater than the previous season's pack of 3,500,000 cases. Only pineapples were in short supply for canning. The summer crop of this fruit in the state of Queensland was one of the smallest on record.

Fruit growers in Africa and France reported success in dispersing hail clouds by the use of rockets.

A new ammonium sulphate factory was completed at Sindri, India, and plans made for modernizing horticultural practices in that country. Panama disease, a fungoid growth which destroys banana plantations, appeared in east Africa, where bananas are among the most important food crops. The movement of bananas from Tanganyika was forbidden, and a search for immune varieties was started.

In the United States, new soil conditioning materials appeared on the market. While these were not fertilizers, it was claimed that they would improve the condition of many soils and make possible the production of greatly increased crops. Much controversial advertising was published, but reports from

gardeners indicated that some of these materials were valuable where clay soil existed but not when used in sandy soils. (See also CHEMISTRY; FRUIT; VEGETABLES.) (E. I. F.)

Hospitalization Insurance: see INSURANCE.

Hospitals. In 1952 the hospitals and the medical profession of the United States and Canada voluntarily assumed the responsibility for maintaining high standards of hospital operation. To the Joint Commission on Accreditation of Hospitals, composed of hospital administrators, physicians and surgeons, went the assignment of surveying hospitals and accrediting them. At a special ceremony, responsibility for accreditation was transferred to the new commission from the American College of Surgeons which, until 1951, carried on this program alone.

Of great importance to hospitals, and to the 19,000,000 patients cared for during the year, was the continued increase in hospital costs. The annual survey of the American Hospital Association found that the cost of operating general, nonprofit hospitals in the United States neared \$1,700,000,000 in 1951. The average cost for each patient each day in these hospitals amounted to \$18.01, an increase of \$1.12 over the previous year, and more than double that of 1946. However, the average patient spent only slightly more than eight days in the hospital, a low reached in 1947 and maintained each year thereafter.

Inflation was only partly responsible for the increased expense of caring for hospital patients. The very nature of hospital care had undergone a transformation in recent years. Revolutionary methods of diagnosis and treatment had been adopted, and while they resulted in tremendous savings of lives, they also required more expensive equipment and medication and highly skilled personnel. Salaries paid to hospital personnel in 1951 represented 56% of total expense, and in many hospitals this figure rose to as high as 75% of total costs.

Despite the rise in expenses, hospitals reached a more favorable financial position during the year. Patient income fell short of meeting expenses by \$137,000,000, but this was compensated for by voluntary contributions from individuals, foundations and industry, as well as by city, county and state allotments for the care of indigent patients.

The Commission on Financing Hospital Care, an independent commission set up by hospitals to study the best means of providing high quality hospital care at the lowest possible cost to the public, began its second year of intensive research. Concentrated studies were undertaken in three areas: the first was a survey of hospital income and hospital costs and an attempt to determine what proportion of his income the average person pays for hospital care; the second sought to establish the extent of coverage of hospitalization insurance and its cost; the third concerned possible methods of financing hospital care for those who were unable to pay for it themselves.

U.S. hospital construction during the year kept pace with the need for more facilities, although there was still a shortage of nurses, internes and other hospital personnel. By Oct. 1, 1952, more than 1,900 projects had been approved since passage of the Hill-Burton Hospital Survey and Construction act which provided for hospitals to be built, remodelled or enlarged with community funds supplemented by federal appropriations. Of approved projects, 1,055 were completed and in operation, 731 were under construction and 137 were in earlier stages of development. The total cost was estimated at nearly \$1,500,000,000, of which the federal share was \$525,000,000. The program provided for 92,128 hospital beds and 306 health centres, in addition to 63 health centres combined with general hospitals.

The "book value" of hospitals in the United States had grown more than 40% since 1947, the first year for which estimates were available, and in 1951 totalled nearly \$8,250,000,000. This put hospitals in the position of fifth largest industry in the country from the standpoint of plant assets. (See also VETERANS ADMINISTRATION, U.S.)

Canada.—The cost of operating short-term hospitals in Canada continued on the rise, averaging \$10.25 for each patient per day during 1951 as compared with \$9.88 the year before. The average length of patient stay remained at about ten days.

Federal grants in 1952 encouraged continued hospital construction and expansion, increased the number of outpatient departments and travelling tuberculosis detection services and set up new rural health units.

During the year, surveys were made of health facilities and requirements in two provinces which did not have compulsory prepayment plans. In Quebec it was noted that hospital facilities were not available in all regions of the province, and it was recommended that the provincial department of health continue to favour the opening of hospitals in strategic locations. In Manitoba the study supported the principles of a health insurance plan for Canada, but suggested that priority be given to the preventive medical services now being set up under the province's own health plan.

BIBLIOGRAPHY.—"Administrators Guide," *Hospitals*, Journal of the American Hospital Association, pt. 2 (June 1952). (GE. BU.)

International.—The second postwar study tour organized by the International Hospital federation took place in Italy from May 24 to June 7, 1952, at the invitation of the Italian Hospital federation. Approximately 130 members of the federation from 15 countries, including 30 representatives from Great Britain, took part in the tour, which in a fortnight covered the principal hospitals in and near Milan, Bologna, Florence, Rome and Genoa.

The eighth International Hospital congress was to be held in Great Britain from May 25 to 30, 1953. A hospitals exhibition was planned to take place at the same time as the congress in London, which would give hospital workers from all over the world an opportunity of seeing for themselves the latest developments in hospital equipment.

Great Britain.—The financial position of the country called for the utmost economy in the social services, and the government announced that expenditure on the national health service would be limited to £400,000,000. It was widely recognized that some increase in the cost of the hospitals was inevitable, and when the health estimates were published in March 1952 the figure for the hospital and specialist service was increased by about £20,000,000, the comparative figures being £285,000,000 in 1951-52 and £304,000,000 for 1952-53. In May H. C. F. Crookshank resigned his appointment as minister of health and was succeeded by Iain Macleod.

The first detailed costing returns for hospitals in the national health service in England and Wales were published by the ministry of health early in June. These covered about 2,750 hospitals and were for the year ending March 31, 1951. They were a first interim measure, in a tentative form, to enable hospital authorities to compare the average costs of individual hospitals, and those costs and the regional and national average figures.

The investigation into hospital costing undertaken by King Edward's Hospital fund for London and the Nuffield Provincial Hospitals trust at the invitation of the ministry of health was concluded during the year and their reports were published.

There was also published in June the first volume of a new series of statistics (*National Health Service; Hospital and Specialist Services, England and Wales, Statistics for the Year Ended*

31st December, 1949, H.M.S.O., London) showing the beds, patients and medical, nursing and other staff by categories of all the hospitals in the state service in England and Wales. (A. G. L. I.)

Hotels. The U.S. hotel industry, after six years of gradually declining room occupancy, reached a levelling-off point in 1952, and occupancy remained constant at approximately 79%. Sales volume, however, increased about 7% as a consequence of the shrinking value of the dollar. Room sales were up 7% to 8% and both food sales and beverage sales rose about 6%. Net income before taxes remained virtually unchanged.

Hotels continued to benefit from two trends which had been noted in previous years. One was a gradual increase in convention and other group business, as businessmen found it more and more necessary to meet and discuss mutual problems. The other was a continual lengthening of resort seasons, winter as well as summer, enabling resort operators to make greater use of their facilities by spreading their operations over a greater portion of the year.

The second trend was advantageous to vacationists as well as to hotels, since it had the effect of making resort facilities available to a greater number of people in the course of a year, and also made possible significant economies in off-season vacationing.

A nation-wide survey made for the American Hotel association during 1952 revealed that transient hotels, large and small, had created many new services and facilities to appeal especially to motorists and travelling family groups. For the convenience of the motor travellers, some hotels had built motor entrances, with special registration desks and stairs or elevators, to make it possible for the motorist to check in at this entrance and go directly to his room, without passing through the lobby. Many hotels had added storage garages or parking lots and sometimes both. Others, unable to provide conveniently for motorists because of their congested downtown locations, had built motor annexes on the outskirts of their cities to make hotel comfort and convenience more readily available to the motoring public.

Special services and facilities for travelling family groups were keyed to the fact that increasing proportions of business and pleasure travellers were accompanied by children. To serve these guests, hotels created playground areas and special dining facilities for guests with children. Many provided children's menus, with half-portion prices. Cots, cribs and double-decked bunks were available in a large number of transient hotels, and some also provided nursery facilities and baby-sitting service. (See also TOURIST TRAVEL.) (C. A. HH.)

Great Britain.—As in recent years, hotels, restaurants and inns were affected in 1952 by the fact that, on the one hand, costs of operation were rising and, on the other, there was in most countries a curtailment in the spending power of the public, resulting from increased taxation and the rising cost of living.

As regards residential establishments, another change which had been developing before World War II showed itself again in 1952. This was that bookings generally were for shorter periods than formerly. Reasons for this were the improvement of travel facilities by land, sea and air, and the fact that if possible many people would rather move on from place to place than remain in one centre for a whole holiday.

Hotels, restaurants and inns continued to benefit from the encouragement given to tourists by governments and local authorities everywhere. Continual propaganda by means of leaflets, posters and motion pictures, combined with the staging of special attractions on a national and local scale, made the tourist

feel that he was a much-sought-after person. In Great Britain the success of the campaign for attracting tourists was reflected in another new record in the number of visitors from abroad reported by the British Travel and Holiday association. Already in the summer of 1952 plans were being made for the reception of the vast crowds expected to attend the coronation of Queen Elizabeth II in 1953, and a coronation accommodation service was established by the British Travel and Holiday association and the British Hotels and Restaurants association.

During the year, further consideration was given to amending the wages orders, under the Catering Wages act, 1943, to which had been attributed many of the difficulties which British establishments had had to face in postwar years. By the end of the year little had been achieved that materially altered the position, and unlicensed residential establishments were still not subject to a wages order, although licensed establishments had been regulated since 1948.

There was no decrease in the number of United States visitors to continental resorts, while the flow of British visitors to the continent was not appreciably affected by the reduced currency allowance available to them. In Great Britain management still suffered from the strict rationing of some foods, though tea was derationed in October.

Marked attention was paid to the technical training of entrants into the hotel and catering industry. In Great Britain a national apprenticeship council was set up which was expected to have a beneficial effect on catering standards. (H. C. CE.)

Housing. For the second consecutive year the number of new nonfarm dwelling units started in the United States during the first half of the year showed a decline. During the months of January-June 1952, 565,700 housing units were placed under construction, an amount 4.1% lower than for the comparable period of the previous year and almost 20% below the first six months of 1950.

During the first half of 1952, 55% of total new residential construction occurred in cities and other urban places, contrasted with a proportion of 58% in these areas during the first half of 1951. Continuing to compare these two periods: dwellings in one-family structures constituted 81% as against 80% of total, and privately owned construction rose from 90% to 92% of total. The average estimated construction cost per unit remained virtually unchanged from the previous year, but stood 10% higher than 1950 and 20% larger than 1949.

Indications of softening in the market for new residential construction began to appear in various sections of the nation early in the year. It was first observed among the higher priced units in both apartment and single-family houses. Whereas, previously, units had been snapped up upon completion, or even earlier, vacancies in new units were beginning to appear and many new houses remained on the market for weeks without as much as an inquiry. Several large apartment houses were forced into foreclosure and prices for single-family houses over \$15,000 began to sag. Builders who had constructed 100 houses at a time began to limit their current volume to 30 or 40. Although in some areas housing shortages were still acute, by and large the intense housing pressure of the postwar years appeared to have been relieved. People were becoming more discriminating—refusing to consider residences that were too far removed from places of work or recreation and insisting upon a higher standard of construction. The amount of housing required to accommodate new families had also declined, reflecting a marriage rate in 1951 that was 30% below 1946.

A large part of the tightening of demand, it was claimed, was the result of factors related to housing finance: mortgage lenders were becoming more cautious, mortgage interest rates were

considered to be too low, and regulation X kept many potential buyers out of the market by the down-payment requirement.

Mortgages.—The dip from high levels of construction caused many mortgage lenders to pause and consider the possibility of another long-term decline in the residential construction cycle. Recent research studies of mortgage investment experience undertaken by John Lintner of Harvard university and by Raymond J. Saulnier for the National Bureau of Economic Research, indicated that mortgage loans made close to the peak of the real estate cycle in the 1920s showed a higher rate of foreclosure and delinquency in payments than loans made during other periods. Many lending institutions, accepting these facts, began to reshape their policies in accordance with them. Loans which had previously been made or purchased in block were now examined individually and the whole process of mortgage selection tightened.

The low prevailing rate of interest on mortgage loans was another reason for the tightening of mortgage credit. Lenders maintained that the interest rate was no longer commensurate with the increasing risk. Moreover, the interest rate on government bonds had risen, so that new mortgage loans could no longer compete favorably with government bonds as an outlet for institutional investment. The mortgage money contraction was felt most severely in the Federal Housing administration and Veterans administration loan programs. FHA loans (4½% and VA loans (4%) net about 3¼% and 3½% respectively to the lenders. In the first half of 1952, both FHA one- to four-family house mortgage insurance written and VA-guaranteed and insured home loans closed had declined 22% from the same months of 1951. During this period the total amount of nonfarm mortgages (of \$20,000 or less) recorded rose 4%. As a consequence, government insured and guaranteed home mortgages equalled 27% of total recordings as against 36% in the first half of the previous year.

In order to secure a higher return on G.I. loans, the interest rates on which are fixed by the government, some lenders entered into "warehousing" agreements with builders. Under this arrangement lending institutions agreed to purchase all the builders' mortgages at 95% of face value. The builder had to absorb the 5% loss which reduced his profit or pass all or part of this amount on to the purchaser in the form of higher prices. This practice was in sharp contrast to the 3% to 5% premiums that lenders were paying for mortgage loans five years before.

Early in the year the senate banking and currency committee held a round table on mortgage money problems. At this time increases in interest rate were suggested, but Sen. Burnet R. Maybank, committee chairman, as well as other experts did not believe that a small rise in interest rate would bring out the necessary amount of mortgage money. A large increase in interest would raise mortgage payments too much.

A suggestion emerged from these conferences that was later incorporated into the Housing act of 1952. It was pointed out that mortgage money would be more readily forthcoming, particularly for loans in critical defense housing areas, if the Federal National Mortgage association (a government agency) were to make prior commitments to purchase such loans from the original lender. Although this procedure was tried for a short while during the veterans emergency housing program, the FNMA functioned primarily as a secondary mortgage market to acquire from primary lenders mortgages that could not be sold to other institutions. The Housing act of 1952 authorized \$900,000,000 for mortgage purchases and commitments by FNMA. These purchases were limited, however, to government insured or guaranteed mortgages on defense housing, and on houses made available to victims of catastrophe which the president had declared a major disaster.

Credit Controls.—The major issue in home finance in 1952 centered around regulation X. Home builders were caught between cautious lenders on the one hand and contracting demand on the other. By midyear it was estimated that 250,000 new houses were unsold, an amount equivalent to more than 40% of total production during the first six months of the year. The builders felt that if purchasers could be secured mortgage money would somehow or other find its way into the market. They therefore focused their attention on regulation X which they felt excluded a sector of potential purchasers from the market because of the equity requirement that went up to 50% on homes in the higher price brackets. In mid-June the federal reserve board relaxed regulation X slightly, and by the end of June a formula had been written into law providing for its complete removal.

An amendment to the Defense Production act stipulated that if housing starts for any consecutive three-month period should fall below an annual rate of 1,200,000 dwellings, down-payment requirements should not exceed 5% of the sale price. The amendment further provided that the relaxation of credit controls be put into effect not later than one month after the expiration of the consecutive three-month period during which starts fell below the annual rate of 1,200,000. The formula provided that the housing to be counted in the monthly estimates should consist of permanent (public as well as private units), nonfarm, family dwelling units.

During the months of June, July and August, housing starts fell below the annual rate of 1,200,000. In mid-September the two-year-old curbs on mortgage credit were suspended and conventional mortgage loans made by banks, savings and loan associations and other private sources were no longer subject to federal restrictions on this score. Regulation X might be reimposed, however, whenever new housing starts climbed above the 1,200,000 rate for three consecutive months. Builders were thus in the position of never being quite certain that the credit conditions prevailing when a group of houses were placed under construction would be the same at the time the completed structures were placed on sale.

Rent Control.—Another step in the direction of the removal of rent control, one of the most controversial issues in U.S. housing, was taken in 1952. A federal act provided that unless a city or town specifically indicated its desire to continue these controls, they would lapse as of Oct. 1, 1952. According to the Office of Rent Stabilization, of the 2,400 communities under rent control prior to Sept. 29, approximately 1,500 voted to continue under the law while the remaining 900 permitted the law to lapse. In noncritical defense areas the number of persons covered by federal rent control was reduced from 20,000,000 to 12,500,000, and the number of dwelling units from 6,000,000 to 4,000,000. Even in these areas controls, along with the price and wage stipulations of the Defense Production act, were due to expire on April 30, 1953, unless congress should act to extend these sections of the law beyond that date.

It must be remembered, however, that rent control was still mandatory in several states that had their own statutes. In New York state alone rents were regulated on close to 3,000,000 individual housing accommodations, and in Wisconsin dwellings in the cities of Milwaukee and Madison were similarly covered. In addition, federal rent controls were in force in 118 critical defense housing areas and another 28 areas were in the process of being certified into this group.

Continuing under federal rent control were 36 of the 51 cities with population of 100,000 or more. These included Baltimore, Md., Boston, Mass., Chicago, Ill., Cincinnati, O., Cleveland, O., Minneapolis, Minn., Newark, N.J., Philadelphia, Pa., Pittsburgh, Pa., St. Louis, Mo., and San Francisco, Calif. In addi-

CAVE DWELLING in Matera, It., where farmers and their families still shared living quarters with their domestic animals in 1952. Near by, a model village was being built by the government to house them

tion, controls were retained by 78 out of 116 cities with populations from 50,000 to 100,000 and by 1,350 smaller communities. Among the major cities that failed to act in time to continue controls were Akron, O., Atlanta, Ga., Denver, Colo., Detroit, Mich., New Orleans, La., Seattle, Wash., and Toledo, O.

Federal Public Housing Program.—A ceiling of 35,000 was established by congress on public housing units to be constructed during the fiscal year 1953, or in any subsequent year. This action substituted a fixed annual maximum of 35,000 units for the variable ceiling established by the Housing act of 1949. The 1949 act authorized construction of new public housing units at a rate not to exceed 135,000 per year for the six fiscal years, July 1, 1949, through June 30, 1955. The 135,000 figure could be increased or decreased in any one year upon presidential recommendation, but a limitation of 810,000 was stipulated for the entire six-year program. The program in the 1951 fiscal year was cut back to 30,000 for the last six months of 1950, and in fiscal 1952 the ceiling was 50,000.

Despite legislative setbacks, by the end of Aug. 1952, 144,272 new dwelling units had been started under the low-rent housing program established by the Housing act of 1949. About one-third of these units (45,532) had been completed and made available for the occupancy of families whose income was insufficient to allow them to rent or purchase adequate living quarters, and households displaced by slum clearance and redevelopment projects. As of Aug. 31, 1952, there were 246,504 dwelling units in low-rent housing under the management of the Public Housing authority. An additional 101,891 were under construction and 67,207 were in various preconstruction stages. The PHA had more than 730,000 units in its total work load, but 307,000 of these were units in the process of disposition. (See also ARCHITECTURE; BUDGET, NATIONAL; BUILDING AND CONSTRUCTION INDUSTRY; BUSINESS REVIEW; MUNICIPAL GOVERNMENT; TOWN AND REGIONAL PLANNING.) (CH. RA.)

Canada.—Housing continued throughout 1952 to be Canada's foremost economic and social problem. In midyear, it was estimated that Canada could use 700,000 new housing units immediately. The situation sparked many spirited attacks upon the federal government for its housing policy; social agencies blamed housing shortages for marital troubles and juvenile delinquency; members of parliament demanded more federal government lending at lower interest rates and more loans with smaller down payments; labour unions demanded more vigorous federal construction of low-rental housing projects and criticized government policy that funnelled investment funds into debentures and bonds instead of into housing. Replying to its critics, the federal government blamed the house-building slump on the lack of land serviced with roads, water, sewers and schools, and ignored demands for a federal-provincial conference on the housing problem. However, the federal government used the National Housing act to give the provinces and municipalities greater encouragement to initiate slum-clearance projects and extended government-backed loans into areas where there were no regular financing facilities.

Ontario was among the provinces taking separate steps to increase housing. It set up a crown company to make loans to prospective homebuilders in villages and hamlets, and on farms where private lending institutions were less willing to take mortgages. It gave the department of planning and development powers of expropriation to facilitate assembly of land for housing and also to make possible industrial participation with governments in housing projects.

Some of the housing problems of 1952 were directly related to housing costs. A house that had cost \$7,000 to build in 1950 cost \$9,000 in 1952, according to figures released by the federal crown company, Central Mortgage and Housing corporation. On the average, it cost Canadians \$10,211 to buy a house in 1951, which was 16% higher than in 1950. The down payment in 1951 was \$3,188, compared with a down payment of \$1,928 in 1950. There was much evidence that these mounting costs rose still higher in 1952. Approximately 150,000 building tradesmen sought and generally received higher wages, and where such pay increases were not quickly won, strikes were called. The first legal employers' strike came when the general contractors of Vancouver, B.C., in a provincially supervised move locked out 1,500 striking carpenters (wanting a 90-cent per hour pay boost) and 6,000 other nonstriking construction workers.

In the first four months of 1952, 18,391 houses were completed, compared with 25,209 in the corresponding period of 1951.

(C. Cv.)

Great Britain.—By July 31, 1952, 1,600,230 new houses, flats and other units of accommodation had been provided in the United Kingdom since 1945. The total number of new dwellings completed under the post-World War II program was 1,304,444 (1,147,298 permanent and 157,146 temporary). This represented a formidable rehousing achievement carried out in seven years when costs were high, materials scarce and manpower not readily available.

Harold Macmillan, minister of housing and local government, determined that under him the government would produce more houses than the 200,000 a year which his Labour predecessor had regarded as the maximum figure, considering other demands on the building industry—the defense program, the need for new factories, etc. Macmillan's program also included a reduction in housing standards. The postwar house of the Labour government had, on the average 1,000 sq.ft. of floor area. Macmillan calculated that by adopting the terrace house as the norm, there would be a saving in capital cost of at least £150 on each house. He took the view also that by skilful interior planning room sizes could be maintained—by reducing circulation space, by

combining the hall and the dining room and by producing "large living-room" house, new to the United Kingdom but already popular in Canada and the United States, in which the stairs rose from the living room and the whole house was heated from a central heating system.

The scheme had the further advantage of enabling more houses to be built with the same material and the same manpower. The ministry's publication *Houses 1952*, the second supplement to the *Housing Manual 1949*, claimed that the new plans retained the minimum room sizes of the 1949 manual.

The net house floor areas ranged from 679 sq.ft. for a semi-detached house for four persons to 854 sq.ft. for a terrace house for five persons. At the best it represented a drop in postwar standards of more than 150 sq.ft. of living area and at the worst a drop of more than 400 sq.ft. The best was a slight improvement on the Tudor-Walters standards of 1918–31 housing, and the worst fell considerably below that standard. The homeless, the young couples living with their in-laws, and the wives who shared a kitchen regarded a small house of their own as infinitely better than no house at all, and the minister's policy slightly enhanced their prospects of securing a house of their own.

The minister did not carry his zeal for economy into the field of housing finance, and he perpetuated the high, uneconomical subsidies for multistory development in the centre of cities which had been incorporated by Aneurin Bevan in his 1946 Housing act. Gordon Stephenson, head of the Liverpool university school of architecture, in an address to the Town and Country Planning Summer school, said of these subsidies: "On normal houses the value of the 1952 subsidy at 4½% is £76. On flats with lifts on land at £10,000 to £12,000 an acre, the subsidy is £2,094." When it is remembered that the floor area of a flat was generally about two-thirds the floor area of a subsidized house, the discrepancy was even more marked. It meant that, with or without Macmillan's saving in space, it was possible to build a family house for a total cost of £500 to £700 less than the subsidy alone on a small flat. It was felt by many that the policy of flat development, wholly alien to the English tradition and character, had been, and was being, imposed upon the people against their will.

Belgium.—The number of private houses built in Belgium in 1951 was 26,747, compared with 33,794 in 1950. The total number of houses of all kinds built in 1951 was 33,612. On Dec. 31, 1951, 11,143 houses were under construction, compared with 14,759 on Dec. 31, 1950. About 96% of the total building work in Belgium was devoted to house building.

France.—From the liberation to Dec. 31, 1951, 249,820 houses had been built in France and at that date 219,880 further houses were in course of construction. In 1951, 44,345 new houses were built and 30,575 war-damaged houses were restored.

The Netherlands.—In 1951 the number of new houses finished in the Netherlands was 58,666 (1950, 47,300). At the end of July 1952, 29,095 houses had been completed.

Norway.—In 1951 Norway's housing program was stepped up enormously and 21,000 houses were completed. In the first six months of 1952, 15,000 houses were built, compared with 7,800 in the first half of 1951.

Sweden.—It had taken Sweden until 1946–47 to bring its housing output up to the prewar rate. In these two years 116,000 were built, the total exceeding the two immediate prewar years by 3,500 houses. Since 1947 there had been a sharp decline descending to 41,551 in 1949 and rising slightly to 43,935 in 1950. Sweden continued to occupy an outstanding place in housing design. In the matter of family living space its record was not so good. More than half the houses built in 1949 and 1950 had two rooms and a kitchen, or less, and 5,198 houses, although

equipped with central heating, were without a private bath or toilet or both.

U.S.S.R.—It was reported that in the first postwar five-year plan 120,000,000 sq.yd. of living floor space had been built in the U.S.S.R. Taking the average in the postwar U.K. house at 1,000 sq.ft., this represented the construction of 1,080,000 comparable houses. The figures issued by the U.S.S.R. corresponded closely with statistics used by E. M. Chossudovsky in the *Housing and Town and Country Planning Bulletin No. 5*, published by the United Nations. The first postwar five-year plan aimed at producing the equivalent of 129,000 United Kingdom houses. This target was reported to have been passed.

Humour of 1952. The United States public stayed with its old favourites in the comedy field during 1952, and comedians who had claimed their interest briefly in 1951 for the first time faded a bit. Perhaps because this was an election year, there was entertainment enough in the political field.

Television.—Television continued to be the first target of all comics in 1952. Performers who were successful in the newest of the entertainment media could write their own ticket in allied fields of vaudeville, movies, night clubs and radio.

However, the general direction of TV comedy seemed to be changing, with about 15 weekly shows being based on situation comedy. In this form, the actions of the characters are plotted out in a story form. Most notable and popular of these shows was "I Love Lucy," with Lucille Ball and Desi Arnaz, a show that utilized slapstick along with the story. Many old radio favourites were in television: Amos and Andy, George Burns and Gracie Allen, "My Friend Irma," "Life with Luigi" and "I Married Joan" with Joan Davis.

In the slapstick and fast-talking kind of comedy, Red Skelton's sketches seriously threatened Milton Berle's long occupancy on the throne of TV comics. When Berle returned to television in the fall, he changed his format from that of a variety show to a show with theme and continuity.

Other comedians of the Skelton-Berle genre, primarily vaudevillians, continued in high popularity, such as Eddie Cantor, Bob Hope, Jimmy Durante and Dean Martin and Jerry Lewis.

Widely hailed as the freshest comedian of the year was Jackie Gleason, whom some critics labelled "chaplinesque."

In the lighter field of humour, many stars disappeared from the weekly scene, made only occasional appearances, appeared in panel shows or changed their format completely. Arthur Godfrey continued to hold his tremendous audiences, but Dave Garroway began to do a news show, Herb Shriner got a job as a quizmaster, and Robert Q. Lewis, Ken Murray and Sam Levinson all were without shows of their own. However, the satirical humourists, Sid Caesar and Imogene Coca, held fast to large and appreciative audiences.

Radio.—There was little significant change in the field of radio. "Big Show," which starred Tallulah Bankhead, went off the air, and Miss Bankhead made her television debut.

Stage.—One of Broadway's top hits was "Top Banana," starring Phil Silvers, who did a take-off on Milton Berle. "New Faces of 1952," another Broadway production, brought fresh talent to the stage in some extremely amusing satirical sketches. Among the members of the cast were Robert Clary, Alice Ghostly and Eartha Kitt. Plays such as "The Fourposter,"

"Mrs. McThing," "Guys and Dolls" and "The Moon Is Blue" continued to enjoy long runs. There was a revival of "The Male Animal." Other new shows included "Wish You Were Here" and "An Evening with Beatrice Lillie."

Movies.—Hollywood continued to produce the same sort of comedy films it had for years, with nothing particularly notable in the field. Martin and Lewis were probably the most popular comedy team appearing, Bob Hope made another film and Abbott and Costello continued with their usual success.

Supper Clubs.—The New York supper club continued to be the cradle of American humour, replacing vaudeville. Places such as the Village Vanguard, the Blue Angel and La Ruban Bleu hired fresh and new talent, some of which was destined for stardom.

Books.—Edward Shepherd Meade's *How to Succeed in Business Without Really Trying* was a top best seller. Other popular works were Bennet Cerf's anecdotal *Good for a Laugh*, Louis Untermeyer's *Best Humor Annual*, the *James Thurber Album*, Ira Jan Wallach's *Hopalong-Freud Rides Again*, S. J. Perelman's *The Ill Tempered Clavichord*, Ludwig Bemelmans' *How to Travel Incognito* and P. G. Wodehouse's *Angel Cake*.

General.—Possibly because the Korean war continued to drag on and possibly because of the election year, people seemed to be laughing less than usual. There was little humour arising from the Korean conflict, even bitter humour. Bill Mauldin, whose "Willie and Joe" kept the G.I.'s of World War II laughing at themselves, did a book on Korea, but he seemed to be trying to tell people about the war rather than satirizing it.

The seriousness of the presidential campaign precluded many jokes about it. Little parodying of the candidates was done by comedians, little satire and few imitations. (D. C. G.)

Humphrey, George Magoffin (1890—), U.S. government official, was born on March 8 at Cheboygan, Mich., and received his law degree from the University of Michigan, Ann Arbor, in 1912. Until 1918 he practised law with his father's firm in Saginaw, Mich., and in that year he was appointed general counsel of the M. A. Hanna company, steel and coal manufacturers, at Cleveland, O. In 1925 he was named vice-president and in 1929 president of the company, which he expanded into a large and profitable industrial enterprise. He became chairman of the board in May 1952. During the administration of Pres. Harry S. Truman, Humphrey accepted two quasi-federal posts—chairman of the U.S. department of commerce's business advisory council in 1946, and head of a survey of German industrial plants conducted by the Economic Cooperation administration in 1948–49. A supporter of Sen. Robert A. Taft for president prior to the Republican convention of 1952, Humphrey was selected by Dwight D. Eisenhower on Nov. 21, 1952, to be U.S. secretary of commerce in the new administration.

Humphrey, Hubert Horatio, Jr. (1911—), U.S. senator, was born on May 27 at Wallace, S.D. He studied at the University of Minnesota, Minneapolis, and Louisiana State University and Agricultural and Mechanical college, Baton Rouge, and taught political science at both of these universities. In 1941 he joined the Work Projects administration, and specialized during World War II in re-employment training for veterans. He was mayor of Minneapolis from 1945 to 1948 and was elected U.S. senator from Minnesota on the Democratic ticket in 1948 for the term 1949–55. A member of the "liberal" wing of the party, Humphrey was national chairman of the Americans for Democratic Action in 1949–50. He was credited with having secured acceptance of the civil rights plank in the 1948 Democratic party plat-

form that resulted in the States' Rights Democrats split. He also took a prominent role in the 1952 Democratic convention at Chicago, Ill., and was himself a "favourite son" candidate from Minnesota. With Sen. Blair Moody of Michigan and Sen. Herbert H. Lehman of New York he unsuccessfully opposed the seating of Virginia, South Carolina and Louisiana after these southern states had refused to take the convention's "loyalty pledge." At the convention, Humphrey was a leader in the temporary coalition between Sen. Estes Kefauver and Averell Harriman which sought to stop the nomination of Adlai E. Stevenson.

Hungary. A people's republic of southeastern Europe, Hungary is bounded west by Austria, north by Czechoslovakia, east by Rumania and south by Yugoslavia. Area: 35,893 sq.mi. Pop.: (Dec. 31, 1948, census) 9,201,158; (1951 est.) 9,390,000. Language (1947 est.): Hungarian 92.9%, German 5.1%. Religion (1947 est.): Roman Catholic 65.6%, Greek Catholic 2.5%, Calvinist 20.8%, Lutheran 6%, Greek Orthodox 4%, Jewish 4.3%. Chief towns (1941 census): Budapest (cap., 1,164,963; 1948, 1,058,288); Szeged (136,752); Debrecen (125,933); Miskolc (109,433). Chairman of the presidium of the national assembly in 1952, Sandor Ronai and (from Aug. 14) Istvan Dobi; prime ministers, Istvan Dobi and (from Aug. 14) Matyas Rakosi.

History.—At the session of the national assembly on Aug. 14, 1952, Dobi, the prime minister, resigned and Rakosi, a vice-premier and leader of the Workers' (Communist) party, became premier. Dobi was promoted to the presidency of the republic, while President Ronai was made chairman of the national assembly. This was a demotion for Ronai, the last former Social Democrat to occupy a position of decorative importance. When in 1951 the extreme left wing of the Socialists was purged from its positions in the state and in the Workers' party, Ronai alone remained. The appointment of Rakosi, following by two months the appointment of G. Gheorghiu-Dej as premier in Rumania, removed the last "peasant" premier of a satellite country.

The personality of Rakosi received more than usual publicity during 1952. His 60th birthday celebrations were marked by fulsome flattery. The little Stalin of Hungary was copying his genial prototype even in small details. Among these was the falsification of history to the advantage of his own reputation. In the Soviet Union it had become sacred dogma that Trotsky did nothing for the Bolshevik cause in the revolution, and that the civil war was won by Stalin's defense of Tsaritsyn. In Hungary the name of Bela Kun, leader of the Communist regime of 1919, was erased from all history books, and now the greatest exploit of the revolutionary war was an alleged victory at Salgotarjan, won by the courage and organizing genius of Rakosi. One difference between the two cases was that Stalin in 1917–20 really was a person of some importance, even if a lesser figure than Trotsky, whereas Rakosi in 1919 played a minor political role and no military role at all.

The most publicized industrial exploit of the year was the opening of the new blast furnace at Diosgyör on May 11. Official commentary claimed that it had been built in eight and one-half months, and that the success was largely the result of Soviet aid. In an article in *Pravda* of March 1, Erno Gero, Hungarian chief planner, stated that coal, iron, steel, electric power and crude oil production were lagging behind the development of the machine industry.

Various steps were taken to coerce industrial labour. The trade unions acquired new leadership on Jan. 17, when Antal Apro, the general secretary, was replaced by Istvan Kristof. On May 1, a system of employment cards was introduced to stop movement of workers from one job to another. No worker might be taken on by any enterprise if his employment card was

not in order. Heavy fines were introduced in June for absenteeism in the mines. Socialist competition and Stakhanovism were to be developed more than ever. *Szabad Nep*, the Communist party's daily organ, complained on July 13 that managers remained satisfied with the achievements of individual Stakhanovites without taking adequate steps to ensure that the working methods of these Stakhanovites were accepted and applied by every worker. The aim behind this criticism was that exceptional outputs achieved by Stakhanovites should as quickly as possible be made the "norm," that is, the minimum standard expected of every worker, by which his wage was calculated.

At the beginning of the year collective and state farms together had nearly 25% of the arable land. The pace of collectivization was slow until August, when, as in previous years, it was once more speeded up. Meanwhile the organization of the "Socialist sector" of agriculture was made stricter. On May 20 a ministry of state farms was set up. Just previously, on April 23, a government resolution had laid down precise recommendations for tightening labour discipline in collective farms. The system of permanent brigades, specialized work teams led by foreman and working together for three years or more, was introduced. It was laid down that every adult member of a collective farm must perform at least 120 "labour days" a year on the collective land, and mothers of young children at least 80. A "labour day" was a standard amount of work, which might involve more or less than a whole day's work, depending on the degree of skill involved. The minimum amount was designed to prevent peasants from spending a large part of their time in working on their private plots, to the detriment of the collective lands. It was based on the experience of the Soviet Union, where similar rules were introduced in 1939 and later years.

Great efforts were made to popularize courses in the Russian language for Hungarian workers. In 1951 it was claimed that 25,000 had attended. In 1952 the aim was 60,000. (H. S-W.)

Education.—Schools (1951–52): elementary 6,185, pupils c. 1,200,000; teachers 36,800; secondary 405, pupils c. 120,000; technical, pupils 57,000; institutions of higher education 21, students c. 45,000, professors and lecturers 7,200.

Finance.—Budget (1951 est.) revenue 29,623,000,000 forints, expenditure 29,516,000,000 forints; (1952 est.) revenue 42,770,000,000 forints expenditure 42,481,000,000 forints. Monetary unit: forint with official exchange rates of 2.935 forints to the rouble, 33.15 forints to the pound and 11.74 forints to the U.S. dollar.

Foreign Trade.—(1950): Imports U.S. \$265,000,000; exports U.S. \$257,000,000. Main sources of imports (1950): Poland, Czechoslovakia, Rumania and Bulgaria 35.4%; U.S.S.R. 22.7%. Main destinations of exports: four eastern European countries 36.6%; U.S.S.R. 25.7%.

Transport and Communications.—Roads (1951): 15,976 mi. Licensee motor vehicles (Dec. 1950): cars 16,000; commercial 15,500. Railway (1951): 7,100 mi. Air transport (1948): flights 4,447; miles flown 625,800; passengers carried 36,111. Danube shipping (Dec. 1947): merchant vessels 514; gross tonnage 118,717. Telephones (1950): 115,000. Radio receiving set licences (1949): 525,000.

Agriculture.—Main crops (metric tons, 1950): wheat 2,040,000; barley 640,000; oats 220,000; rye 790,000; maize (1948) 2,862,000; potatoes 1,224,000. Sugar, raw value 255,000. Livestock: cattle (1951) 1,700,000; pigs (1951) 4,500,000; sheep (1949) 650,000; horses (1949) 569,000. Food production (metric tons, 1949): milk 1,100,000; butter (1934–38 average) 9,800; factory cheese (1934–38 average) 9,600; meat (export only, 1950) 1,600. Wine production: (1938) 3,259,000 hl. (1951) 3,678,000 hl.

Industry.—Persons employed in all industries: (1950) 600,538; (1951 est.) 989,000. Fuel and power (1950): coal 1,200,000 metric tons; lignite 9,500,000 metric tons; crude oil 490,000 metric tons; electricity 2,360,000,000 kw.hr. Raw materials (metric tons, 1950) pig iron 473,000 steel ingots and castings 1,023,000; bauxite 594,000; aluminum 16,100 cement 923,000.

Hutchins, Robert Maynard (1899–), U.S. educator. was born on Jan. 17 in Brooklyn, N.Y. He left Oberlin college, Oberlin, O., in 1917 to enlist in the U.S. ambulance corps. Entering Yale university, New Haven, Conn., in 1919, he received his A.B. in 1921 and his LL.B. (*magna cum laude*) in 1925. In 1923 he was appointed

cretary of Yale university and in 1927 dean of its law school. In 1929, at the age of 30, he became the fifth president and, in 1945, the first chancellor) of The University of Chicago.

Hutchins resigned in 1950 as chancellor of the university and a member of its board of trustees to join the Ford foundation as an associate director. His resignation became effective at the end of the university's academic year, June 30, 1951, at which time he was granted a leave of absence from Jan. 1, 1951, to participate in the formulation of the foundation's policies. Lawrence A. Kimpton (*q.v.*) was appointed his successor at the university. Hutchins continued as chairman of the board of editors of Encyclopædia Britannica, Inc.

Hutchins' time was devoted during the year to planning, with the other officers, the policies and programs of the Ford foundation. He gave the Marfleet lectures at the University of Toronto, Can., in March.

Ibáñez del Campo, Carlos (1877-), president of Chile, was born on Nov. 3 in Linares, Chile. He was educated at the Chilean military school and at the Academy of War. In 1905 he was appointed rector of the national military school of El Salvador. Returning to Chile in 1908, he was successively staff officer and division commander, director of a carabineer school, section chief of the ministry of war and military attaché at Paris. From 1925 to 1927 he was minister of war with the rank of general; in 1927 he became minister of the interior and later that year vice-president of Chile. By this time Ibáñez was *de facto* chief executive of the nation, and elections held in July 1927 confirmed him as president with virtually no limitation on his power. His administration was a mixture of military dictatorship and welfare state, and until 1929 Chile enjoyed great economic prosperity. Ibáñez eventually was forced out of office in a bloodless uprising (July 1931) and went into exile in Argentina. He was an unsuccessful candidate for president in 1938 and in September of that year was arrested for suspected complicity in a *nacista* (nazi) revolt in Santiago. He was sentenced to 20 years in prison but was released within a few weeks and left the country. Later he returned and was elected senator from Santiago. In 1952 he once more announced his candidacy for president on the Nationalist ticket, reputedly with the backing of his long-time friend, Pres. Juan Perón of Argentina. (Chile officially protested on July 26 that the Argentine foreign ministry was intervening in the campaign.) Ibáñez was elected president on Sept. 4, 1952, by a large majority, for the term ending in 1958. He was inaugurated on Nov. 3.

Iceland. An island republic of the north Atlantic, Iceland has an area of 39,768 sq.mi., and a population (1951) of about 145,000. The capital, Reykjavik, is the only large town (pop.: about 60,000). Religion: Lutheran Christian.

President in 1952: Sveinn Björnsson to his death on Jan. 25; Ásgeir Ásgeirsson after Aug. 1 (elected June 29).

History.—An epoch came to an end in Iceland when, on Jan. 25, 1952, Sveinn Björnsson died, at the age of 71. He had headed the island state since 1941, for three years as regent,

then after assumption of legal independence, as president. After a first one-year term he was re-elected by acclamation in 1945 for a four-year term, and again in 1949, the unopposed leader of the nation.

The first real presidential campaign in modern Iceland had no precedent to follow. Not only must a man be chosen, but the country had to decide what the presidency should be—an honorary or an active post, partisan or above party. The issues had not been faced before, and in 1952 they were discussed but not resolved. On June 29, by a dramatically close vote, Ásgeir Ásgeirsson was elected. Although he was director of the Maritime bank in Reykjavik, he was a Social Democrat, a former president of the *althing*, and prime minister from 1932 to 1934. Second in the balloting was Bishop Bjarni Jonsson.

Iceland had become increasingly worried over the problem of controlling its vital fishing waters. It eagerly watched the international court proceedings in the Norwegian-British case about territorial limits at sea and as soon as that case was decided in favour of Norway, Iceland proceeded to act. The government declared a four-mile limit, with the line running across the mouths of bays. The British and other countries interested in these rich fishing areas protested to no avail.

Reforestation continued with the planting of about 700,000 trees and the exchange of forest personnel with Norway. The fishing fleet counted 57,700 tons, and this together with the merchant fleet passed the 100,000-ton figure. One of the worst difficulties was the continuing inflation—the cost of living index was up 55% in two years. (See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.) (F. D. S.)

Education.—Schools (1951-52): elementary 213, pupils 15,116, teachers 692; secondary 55, pupils 4,574, teachers 326; grammar 2, pupils 764, teachers 51; other schools 58, pupils 4,397, teachers 399. University of Iceland: students 680; professors and lecturers 60.

Finance and Banking.—Budget: (1951 actual) revenue 414,500,000 krónur, expenditure 305,100,000 krónur; (1952 est.) revenue 396,200,000 krónur, expenditure 332,400,000 krónur. Public debt (Jan. 1952): 450,900,000 krónur, including foreign debt 197,800,000 krónur. Note circulation (Dec. 1951): 198,000,000 krónur. Monetary unit: króna (plural krónur), with exchange rates of 45.70 Kr. to the pound sterling and 16.32 Kr. to the U.S. dollar.

Foreign Trade.—(1951) Imports 922,100,000 krónur; exports 726,600,000 krónur. Main sources of imports (1951): U.K. 28.8%; U.S. 13.0%; Netherlands possessions in America 9.9%; Denmark 5.4%; Sweden 4.8%; Federal Republic of Germany 4.7%; Spain 4.5%. Main destinations of exports (1951): U.K. 23.4%; U.S. 18.3%; Netherlands 11.5%; Italy 6.2%; Spain 5.4%; Poland 5.2%.

Transport and Communications.—Roads (1951): 7,185 km. Licensed motor vehicles (Jan. 1952): cars 6,420, commercial vehicles 4,214. Shipping (Oct. 1951): vessels of 100 gross tonnage and over 143, total tonnage 83,448; other registered vessels 530, total tonnage 16,786. Fishing fleet: 631 vessels; gross tonnage 57,733. Telephones (Jan. 1952): 21,368. Radio receiving sets (Jan. 1952): 35,882.

Livestock and Fisheries.—Livestock (Jan. 1951): sheep 415,544; cattle 44,535; horses 42,280; poultry 97,219. Fisheries: total catch (1951) 370,655 metric tons. (G. TN.)

Ice Shows: see SHOWS.

Ice Skating. Dick Button, 22-year-old Harvard student from Englewood, N.J., climaxed a brilliant amateur career in 1952 with a sweep of the national, world and Olympic figure-skating championships, and then, on Aug. 28, turned professional. The two-time Olympic winner signed a contract for \$150,000 with the "Ice Capades of 1953" and made his debut at New York's Madison Square Garden on Sept. 11.

After retaining his Olympic laurels and taking world honours for the fifth consecutive time, Button captured the national senior men's championship at Colorado Springs, Colo., in March and in winning that title for the seventh time in a row equalled the record set by Roger F. Turner of Boston, 1928-34.

Tenley Albright, 16-year-old star from Newton Center, Mass., skated off with the women's senior crown. Other United States champions were Lois Waring and Mike McGein, Baltimore, Md., gold dance; Mr. and Mrs. Rogers Chambers, Buffalo,

DICK BUTTON, who retained his world title for men's figure skating at the 1952 winter olympics, shown during the school figures section of the event at Oslo, Nor.

N.Y., silver dance; Carol and Peter Kennedy, Seattle, Wash., senior pair; Ronnie Robertson, Colorado Springs, junior men; Carol Heiss, New York, senior women; Mary Ann Dorsey, St. Paul, Minn., women's novice; Tim Brown, Baltimore, men's novice, and the Broadmoor club, Colorado Springs, senior team.

Ken Bartholomew of Minneapolis shone among American speed skaters, winning national outdoor senior honours for the seventh time and third year in a row at St. Paul. In capturing the trophy, Bartholomew won the 220-yd., 440-yd., three-quarter-mile and two-mile races and scored 160 points. Arthur Longsjö of Pittsfield, Mass., finished as runner-up with 90 points. Longsjö defeated Bartholomew in the 880 and mile tests and also captured the five-mile race in which the champion did not compete.

Barbara Marchetti, Detroit, Mich., repeated as women's senior champion, scoring 120 points compared with 70 for Jeanne Robinson, Detroit, her closest rival. Other national winners were Dick Pelter, West Allis, Wis., intermediate boys; Jean Simon, Chicago, intermediate girls; Jerry Fusek, West Allis, junior boys; Mary Maland, Minneapolis, junior girls; Al Olsen, Chicago, and Ted Miller, Minneapolis (tied), juvenile boys; Mary Novak, Chicago, juvenile girls; David Kahn, Minneapolis, midget boys; Marge Molthen, West Allis, midget girls.

Longsjö and Ray Blum, Nutley, N.J., each tallied 80 points to tie for men's honours in the North American championships at Alpena, Mich., while Barbara Marchetti and Doreen McLeod of Edmonton, Alta., the Canadian champion, shared the women's laurels with 120 markers each. Other victors were Dick Pelter, intermediate boys; Jean Simon, intermediate girls; Gary Lewis, Bay City, Mich., junior boys; Jean Renshaw, Saginaw, Mich., junior girls; Al Olsen, juvenile boys; Mary Novak, juvenile girls; Terry McDermott, Bay City, and Ken Patterson, Detroit (tied), midget boys; and Audrey Ames, Chicago, midget girls. Blum added to his triumphs by annexing the North American indoor speed title at East Lansing, Mich., and Janet Backman of Wilmington, Mass., won the women's award. (See also OLYMPIC GAMES.)

(T. V. H.)

Idaho. A state in northwestern United States, one of the carved from the old Oregon territory, Idaho was admitted as a territory by Pres. Abraham Lincoln in 1863 and became a state on July 3, 1890. Idaho has an area of 83,557 sq. mi. and is known as the "Gem state." Pop. (1950 census) 588,631, a gain of 12.1% over the 1940 census. Under the new urban definition, 42.9% of the total population was classified as urban and 57.1% as rural. Boise, the capital city, with a population of 34,393, is the largest city in the state. Other cities with populations in excess of 10,000 are: Pocatello 26,131; Idaho Falls 19,218; Twin Falls 17,600; Nampa 16,185; Lewiston 12,983; Coeur d'Alene 12,198; Moscow 10,593; and Caldwell 10,487.

History.—State elective officials assumed their offices in Jan. 1951 for four-year terms and all were Republicans except the secretary of state, Ira Masters, a Democrat. Len Jordan was governor; Edson Deal, lieutenant governor; Robert J. Smylie, attorney general; and N. P. Nielson, auditor. Mr. Margaret Gilbert (Rep.) was appointed treasurer in 1952 to fill the term of Mrs. Lela D. Painter, deceased.

An extraordinary session of the Idaho legislature was held Jan. 15-16, 1952, to enact a motor vehicle reciprocity act made necessary to implement features of the ton-mile tax law enacted in the regular session in 1951.

Idaho's largest hydroelectric development went into operation early in Oct. 1952 when the first of four generators began producing electrical energy at Cabinet gorge on the Clark Fork river, a few miles from the Montana state line. Built by the Washington Water Power Co., at a cost of approximately \$460,000,000, this plant would produce more than 200,000 kw.

Education.—Idaho is served by the state university and agricultural college located at Moscow and the Idaho State college at Pocatello. Junior colleges maintained by junior college districts are located at Boise and Coeur d'Alene. Private colleges are College of Idaho at Caldwell, Ricks college at Rexburg and the Northwest Nazarene college at Nampa. Public school enrolment for 1951-52 was 128,192, an increase of 8.5% in three years; 4,812 teachers were employed in them. The superintendent of public instruction in 1952 was Alton Jones.

Social Insurance and Assistance, Public Welfare and Related Programs.—Idaho has two institutions for the mentally ill—one at Orofino and one at Blackfoot; a home for the feeble-minded at Nampa; a school for the deaf and blind at Gooding; an industrial school at St. Anthony; a tuberculosis hospital at Gooding; and a recreational centre at Lava Hot Springs. The state penitentiary erected a new administration building and increased its facilities by the addition of a new cell block, which allowed for 670 inmates. As of Oct. 15, 1952, there were 461 inmates. As of June 1952 there were 10,603 households receiving public assistance in an amount of \$764,748 monthly with an average payment per household of \$72.13. Old-age assistance payments of an average amount of \$50.82 went to 9,247 recipients in June; a total of 5,381 children, 2,107 families received an average payment of \$43.88; 199 blind recipients were paid an average of \$54.68 in that month, and 807 permanent and totally disabled recipients were paid an average of \$52.55.

Communications.—Idaho had in 1952 a total of 40,577.5 mi. of highway with 4,750.2 mi. under the state highway system. The state was served by four transcontinental railroads with a mileage of 2,732. Water transportation to Lewiston was being expanded on the Columbia and Snake rivers. United and Western air lines maintained scheduled east-west and north-south, while West Coast air lines served southern and northern Idaho.

Banking and Finance.—As of Sept. 5, 1952, 37 state banks and their branches had total deposits of \$121,497,798.15 and 64 national banks and their branches had total deposits of \$359,308,394.79.

The state budget appropriation for the biennium 1951-52 was \$38,921,000 from the general fund. Of this amount 41.80% was to go for humanitarian purposes, 46.40% for education and 11.80% for administration and all other expenses.

Idaho is one of the few states that is debt free. On Dec. 15, 1951, the last obligation of \$4,000 was retired.

Agriculture.—Idaho cash farm marketings for 1951 included \$174,260,000 worth of livestock and livestock products; \$64,134,000 of wheat; \$30,608,000 of Idaho potatoes; \$15,590,000 of beans; \$15,100,250 of

Table I.—Principal Crops of Idaho

Crop	Indicated 1952	1951	Average 1941-50
Wheat, bu. (all)	42,352,000	37,968,000	32,160,000
Corn, bu.	2,520,000	1,962,000	1,592,000
Oats, bu.	9,062,000	8,022,000	7,704,000
Barley, bu.	12,654,000	10,432,000	12,058,000
Sugar beets, short tons	1,062,000	1,227,000	1,082,000
Beans, dry, cwt.	2,183,000	2,502,000	2,300,000
All hay, tons	2,604,000	2,281,000	2,372,000
Potatoes, bu.	45,120,000	37,520,000	39,312,000
Apples, bu.	1,596,000	1,610,000	1,673,000

Source: U.S. Department of Agriculture.

sugar beets; \$12,314,000 of hay and \$8,799,000 of alfalfa and clover seed. The total value of all crops sold was \$177,557,000, making a total of \$351,817,000 for both crop and livestock marketings.

Manufacturing.—In 1941, the Idaho Employment Security agency reported 841 employers engaged in manufacturing in Idaho who paid unemployment compensation taxes on an average of 14,905 employees with an annual pay roll of \$20,304,400. For 1951, the agency's report showed 1,036 employers in that same classification with 24,998 employees who were paid \$85,717,012. For 1951 also, the lumber-products industries continued to top the list of manufacturers with an average of 13,200 wage earners and an annual pay roll of \$49,463,288.

In 1950, of \$109,694,000 total values added by manufacture within the state, the lumber-products industry produced \$43,396,000.

(L. B. J.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Idaho in 1949 and 1950, listing all

Table II.—Mineral Production of Idaho, 1949–1950

(Short tons, except as noted)

Mineral	Quantity 1950	Value 1950	Quantity 1949	Value 1949
Antimony ore	7,000	\$ 876,000	5,000	\$ 1,053,000
Copper	2,000	876,000	1,000	566,000
Gold (oz.)	80,000	2,788,000	78,000	2,724,000
Lead	100,000	27,007,000	79,000	25,058,000
Pumice and pumicite	94,000	121,000	71,000	105,000
Sand and gravel	4,282,000	3,044,000	3,271,000	2,287,000
Silver (oz.)	16,095,000	14,567,000	10,049,000	9,095,000
Stone	644,000	861,000	1,441,000	1,879,000
Zinc	88,000	24,961,000	77,000	18,986,000
Other minerals	4,852,000	...	2,539,000
Total		\$79,077,000		\$64,292,000

†Value included with other minerals.

items whose value exceeded \$100,000. Data for 1951 were not yet available. Idaho ranks 1st among the states in the production of silver and zinc, 2nd in lead and 3rd in phosphate rock, and stands 27th in value of output, with 0.67% of the U.S. total.

Illinois. A north central state of the United States, admitted to the union in 1818, nicknamed the "Sucker state," Illinois is sometimes called the "Prairie state." Total area: 56,400 sq.mi., of which 55,935 sq.mi. are land. Pop. (1950 census): 8,712,176. The population increased 10.3% or 814,935 over 1940, when the official census showed 3,957,149 males and 3,940,092 females; 7,504,202 white, 393,039 nonwhite.

Population classed as urban in 1950 was 6,759,271 or 77.6%; rural was 1,952,905 or 22.4%.

Chicago (pop., 1950, 3,620,962) is the largest Illinois city, followed by Peoria (111,856); Rockford (92,927); East St. Louis (82,295) and Springfield (81,628).

History.—The principal offices in the state government were occupied in 1952 by Adlai E. Stevenson, governor; Sherwood Dixon, lieutenant governor; Edward J. Barrett, secretary of state; Ivan A. Elliott, attorney general; William G. Stratton, treasurer; and Benjamin O. Cooper, auditor.

By direction of the Illinois legislature, four proposed amendments to the state constitution of 1870 were submitted to the voters in the November election. Amendments to revise the revenue article to permit classification of property for taxation, but prohibit a graduated state income tax, and to allow sheriffs and county treasurers to succeed themselves failed. Amendments to repeal a limitation on the salaries of certain county officers and permit the general assembly to fix their compensation, and to remove double liability on stockholders of state banks passed.

Education.—The 2,313 public elementary schools employed 33,273 teachers to instruct 947,032 pupils enrolled for the 1952 fall term. In the 685 public secondary schools enrolment reached 320,744 and the faculty totalled 15,171. State aid to schools for the biennium ending June 30, 1953, aggregated \$151,038,000, nearly twice the amount appropriated for the preceding biennium. With the opening of the 1952 fall term, a new state law went into effect fixing minimum annual salaries for teachers in public schools. The scale ranged from \$1,800 for those with less than 60 semester hours of teacher training to \$2,600 for 150 or more semester hours and the master's degree. Vernon L. Nickell was superintendent of public instruction.

Social Insurance and Assistance, Public Welfare and Related Programs.—Gross expenditures under the state's public assistance programs totalled \$133,851,000 in the fiscal year ended June 30, 1952, an increase of \$6,848,000 over the preceding year. The number of persons dependent upon public aid declined from 290,910 to 266,131 in the same period. In the fiscal year closing June 30, 1952, the Illinois public aid commission reported the following number of average monthly recipients of public assistance and average payments to each (preceding year's figures in parentheses): old-age pensions, 115,751, \$49.85 (121,511, \$46.24); aid to dependent children, 82,853, \$31 (84,508, \$27.09); blind assistance,

Table I.—Principal Crops of Illinois

Leather and leather products	110,845,000	111,149,000

4,119, \$55.12 (4,296, \$49.26); disability assistance, 2,446, \$57.02 (700, \$47.75); general assistance, 60,988, \$35.65 (80,232, \$30.11). In addition, the state expended \$3,294,000 in the 1951–52 fiscal year for burials of public assistance recipients and aid to medically indigent.

Under the stimulus of defense activities the rise in the level of employment, which had taken place in 1951, continued through the first five months of 1952. The weekly number of unemployment compensation claimants in Illinois during these five months varied from a high of 94,400 to a low of 61,900.

In the state's four penal institutions the average daily population during July 1952 was 8,505, an increase of 156 over the same month of 1951. On July 1, 1952, there were 1,065 inmates of the four correctional institutions compared with 940 on that date in 1951. Thirteen state mental hospitals were treating 46,716 patients on July 1, 1952, while a year prior there were 46,127 under treatment.

Communications.—Exceeding all previous years, \$60,739,000 in highway construction work was placed under contract during the first eight months of 1952 as the state launched its biggest highway restoration program in history. Rehabilitation of 7,400 mi. of the state's 12,000-mi. primary highway system was planned in the ten-year program. All roads combined in the state totalled 125,000 mi., of which 104,000 mi. were rural.

Sixty-nine railroads (62 steam and 7 electric) operated over 15,740 mi. of main track to serve 80% of the communities of the state. More than 100,000,000 mi. were travelled by 122 bus companies certificated in Illinois. Fourteen scheduled air lines served the state. Aeroplane facilities were provided by 165 commercial airports and 401 private-use airports.

Banking and Finance.—There were 894 banks operating in the state on June 30, 1952, 3 more than on the same date of the preceding year. Of this number, 508 were state banks and 386 national banks. State banks on June 30, 1952, showed total deposits of \$3,694,959,916 and total resources of \$3,944,964,838. National banks on the same date had total deposits of \$9,641,504,000 and total resources of \$10,378,469,000.

For the biennium ending June 30, 1953, the legislature voted a budget of \$1,464,401,033 to operate the state government. During the first year of the biennium, receipts amounted to \$578,000,000 while expenditures totalled \$522,000,000. An unencumbered surplus of \$71,000,000 remained in the general revenue fund on June 30, 1952, and the finance department expected a gross surplus in the general revenue fund of \$60,000,000 at the close of the biennium. In the first eight months of 1952, the six major tax sources produced the following amounts (1951 comparative figures in parentheses): sales tax, \$129,066,273 (\$128,286,338); cigarette

tax, \$19,915,796 (\$18,701,074); liquor tax, \$13,705,606 (\$15,828,996); motor fuel tax, \$64,843,087 (\$47,105,216); petroleum inspection tax, \$529,979 (\$517,664); public utility tax, \$15,825,886 (\$14,666,095).

Agriculture.—Corn, the state's biggest crop, was expected to yield 515,816,000 bu. in 1952, an increase over both the 1951 total production and the ten-year average from 1941–50. Estimated production of leading crops for 1952, the total for 1951, and the ten-year average, 1941–50, are shown in Table I.

Manufacturing.—The value added by manufacture to products in Illinois in 1950 was \$7,929,910,000, more than \$1,000,000,000 greater than the 1949 total of \$6,898,999,000. Manufacturing establishments employed an average of 1,154,365 workers during 1950, an increase of 50,392 over the preceding year. Salaries and wages of these employees totalled \$4,037,748,000 in 1950, compared with \$3,697,953,000 in 1949.

The value added by manufacture in major industries in the state in 1950 and 1949 is shown in Table II.

(Ad. B.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Illinois in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Illinois ranks first among the states in the production of fluorspar, and stands seventh in value of mineral output, with 4.12% of the U.S. total.

Illiteracy. By 1952, more than half of mankind still could not read and write. The United Nations Educational, Scientific and Cultural organization continued to prove its usefulness in marshalling available resources to combat the problem of illiteracy throughout the world. This was being undertaken through a two-pronged drive which tried to establish universal, compulsory, free education for all children, at least of elementary school age, and attacked illiteracy among adults on as wide a scale as possible. These two activities were being increased simultaneously.

U.N.E.S.C.O.'s most outstanding efforts in this connection were being made through its regional fundamental education centres. These centres were designed to train teachers and leaders in the best methods of combating illiteracy and its related problems. A centre at Patzcuaro, Mex., served the Latin-American region. Another at Cairo, Egy., was to serve the near east area, and other centres were to be established in the far east and in southeast Asia.

The Chinese Communist government was reported to have formulated plans for a mass education program aimed at wiping out illiteracy in China within ten years. The program called for the eradication of illiteracy in state organs within two years; among industrial workers within three to four years; and among younger peasants within six to seven years. An anti-illiteracy drive had already been launched by the Chinese army. Illiterate soldiers were being taught to read by means of a short-cut phonetics teaching method worked out by an army instructor.

A project for the production of materials for the literacy training of adults was undertaken during the year by the government of Jamaica with the co-operation of U.N.E.S.C.O. It delayed its island-wide attack on illiteracy until the end of the year when the entire graded series of teaching materials was complete and had been adequately tested through experimental use. These materials were then made available for classes of adult preliterate throughout the island.

The efforts which had been made after World War II toward raising the level of literacy in South America were beginning to show results. Typical of the frequent reports of progress in this direction was one from Venezuela which stated that in that country 107,000 men and women had been taught to read and write in the past seven years.

In various places throughout the United States and Canada opportunity for literacy education was made available to adults. Through its special training units, the U.S. department of the army continued its practice of compelling functionally illiterate recruits to learn to read and write up to an acceptable standard.

India's battle against its tremendous problem of illiteracy—a rate still quoted as being between 80% and 90% of its population—was being attacked on a national scale in connection with

a five-year plan. This was augmented by technical assistance through the U.S. Point Four program. Frank Laubach was drafted for work in the huge project to demonstrate that grown people can learn to read and write in a reasonably short time. The Indian army continued its work of teaching illiterate soldiers to read and write.

In western Europe, special measures were being taken to wipe out illiteracy. In Portugal about 60% of the population was reported illiterate, one of the highest percentages on the continent. The ministry of education began to enforce existing laws governing primary school attendance. Where necessary it furnished clothing and warm midday meals. Later, efforts were to be made to provide transportation for school children. It was recognized that the percentage of illiteracy could not be reduced by these steps alone, for much of the illiteracy fell within the adult segment of the population. Older persons were to be taught at least how to read and write. The army began the literacy training of young recruits. Cultural and sports leaders as well as commercial and agricultural corporations were asked to co-operate in the literacy program. To help in preventing a relapse into illiteracy, the ministry of education of the Portuguese government also planned to create more libraries in rural districts. (See also ISLAM.) (E. W. GN.)

I.L.O.: see INTERNATIONAL LABOUR ORGANIZATION.

Immigration and Emigration. Since the end of World War II, the number of entries of aliens and citizens into the United States had grown each year. More than doubling the World War II figure, the volume during the fiscal year ending June 30, 1952, for the first time passed the 100,000,000 mark to reach 107,000,000. Of these entries 97% were alien and citizen border crossers who may have made numerous entries across the Canadian and

Mexican borders. The other were crewmen, immigrants and other aliens admitted as visitors, students, government officials and others admitted for temporary periods.

United States Immigrants.—In the fiscal year 1952, the number of aliens admitted for legal permanent residence rose to 265,520, which represented the highest figure since 1929. In the fiscal year 1951 the number admitted was 205,715. The increase was chiefly the result of the admission of 42,786 ethnic Germans under section 12 of the Displaced Persons act of 1948, as amended, and a 45% increase in nonquota immigration of immigrants from western hemisphere countries, alien wives of citizens and others.

When congress limited immigration by means of quotas, it also provided for certain classes of aliens who could be admitted without regard to quotas. The nonquota immigrants may be roughly divided into three groups: (1) geographic (natives of the independent countries of the western hemisphere); (2) professional (ministers and teachers); and (3) wives, children and, in some instances, husbands of United States citizens.

There were 77,196 displaced persons charged to quotas, and 1,982 nonquota displaced persons (chiefly orphans), who were admitted to the United States in the fiscal year 1952. This brought the total number of displaced persons admissions under the Displaced Persons act of 1948 (exclusive of ethnic Germans) to 340,094. Other quota immigrants, including 42,786 ethnic Germans, numbered 117,051. The Displaced Persons act provided that quotas of future years could be mortgaged in order to permit the admission of displaced persons from countries with small quotas. The mortgaging provisions served to bring quota immigration to 194,247, or 39,970 in excess of the established annual quota.

The 71,273 nonquota immigrants were chiefly natives of the independent countries of the western hemisphere and wives of United States citizens. More than one-half of the wives of citizens came from three countries where United States troops were stationed: Germany, Italy and Japan.

Table II.—Nonimmigrants Admitted to the United States, Years Ended June 30, 1950-52

	1952	1951	1950
Total nonimmigrants admitted	516,082	465,106	426,837
Government officials	22,267	20,881	13,975
Members of international organizations	5,137	5,526	5,010
Temporary visitors for business	86,745	83,995	67,984

MIXED REACTIONS of a group of displaced children from Europe, who were resettled in the U.S. in 1952. They are shown at pier 60 in New York harbour, straining for a glimpse of things beyond the restricting fence

The principal countries of birth of immigrants and their class of admission under immigration laws are reported in Table I.

Nonimmigrants.—Nonimmigrants are aliens who enter the United States for temporary periods, or resident aliens of the United States returning from a temporary stay abroad. The figures in Table II do not include such special groups as agricultural labourers, border crossers and crewmen.

Emigrants and Nonemigrants.—Emigrants are, by definition, aliens who depart from the United States after residence of a year or more in the United States, with the intention of remaining abroad. During the fiscal year 1952, there were 21,880 emigrants, including 9,691 who returned to Europe, 2,441 to Asia, 2,760 to Canada, 2,227 to the West Indies and 1,984 to South America.

Nonemigrants are temporary visitors leaving the country after a stay of less than a year, or resident aliens who are leaving for a temporary visit abroad.

During the year ended June 30, 1952, 487,617 nonemigrants departed from the United States. There were 49,972 alien residents who departed for temporary residence abroad. Two treaty traders had return permits. The remainder, 437,643, entered as tourists, transients, government officials, and others who were leaving the United States after stays of a few days to a year's duration. (See also ALIENS; CENSUS DATA, U.S.; LAW.)

(A. R. Mv.)

Other Countries.—During Dec. 1951 and early 1952, there was a general review of migration in various countries and organizations. In Great Britain the Empire Settlement bill was opposed in parliament as inadequate, though the proposed amendment was withdrawn. The bill extended the British contribution (up to £1,500,000 a year toward settlement schemes)

to the end of May 1957. The expenditure in 1951-52 was estimated at £560,000. A Gallup poll taken in Dec. 1951 revealed that 31% of persons questioned wished to emigrate, mainly to commonwealth countries. The average decrease of the British population by emigration over the previous 20 years was 200,000 a year. The Intergovernmental Refugee organization went officially out of existence on Dec. 31, 1951. Since Jan. 1947 the organization had assisted 1,446,700 refugees, of whom 706,177 were resettled: 155,529 in the United States, 117,085 in Palestine and Israel and 113,986 in Australia. A Provisional Intergovernmental committee was set up at the end of 1951 to arrange for the movement of migrants from Europe. Seventeen nations were represented and it was planned to move about 137,500 persons. Of these 90,000 were to be Germans, including 35,000 ethnic Germans (*Volksdeutsche*).

Canada.—There were 194,391 immigrants in 1951. Legislative provision was made to assist the immigration in 1952 of 100,000 to 150,000 persons. At the end of 1951 there were about 20,000 persons in the U.K. awaiting passage to Canada.

Australia.—Since the end of World War II 600,000 immigrants, including 180,000 displaced persons, had been accepted into the country. Nevertheless, only 0.6% of the working population was unemployed during the first quarter of 1952. The immigration quota for 1952 was reduced to 80,000, or one-third of the total average over the previous four years. Within the new quota 25% would be immigrants from the U.K. paying their own passages and 25% from the U.K. on assisted passages, with a similar division of immigrants from other countries.

Germany.—The pressure toward emigration from western Germany was greatly increased by a constant influx from eastern Germany: official figures for May, June and July 1952 were 5,318, 8,541 and 13,000, but the normal average was 200 a day (73,000 a year). Inquiries at the West German Emigration office totalled 52,412 covering 81,031 persons. The main receiving countries were the United States, Canada, Venezuela, Brazil and Chile.

Israel.—David Ben-Gurion stated that he aimed to build up the population of Israel to 2,000,000 by the end of 1953. Because of the state of trade, distress in the work villages and difficulties with untrained and unsuitable settlers, plans for 1952 restricted immigration to 120,000 on a selective basis according to the productive capacity of applicants. (B. L. B.)

Income, Distribution of: see WEALTH AND INCOME, DISTRIBUTION OF.

Income and Product, U.S. According to preliminary estimates, the U.S. national income in 1952 amounted to \$290,500,000,000 and the gross national product to \$344,500,000,000. Both of these comprehensive measures of the value of the nation's output were almost 5% above their previous highs established in 1951.

Higher prices and increased volume each accounted for roughly one-half of the 1951-52 rise in the dollar value of national output. The further increase in real production enabled the nation not only to add to its military strength but to sustain the flow of consumer products at the high 1951 level. The volume of goods and services produced in the United States in 1952 was larger than in any other year—significantly higher than in the peak war year 1944 and twice as high as in 1929. On a per capita basis (that is, after allowance for population increase over the period), real national output in 1952 was more than 50% greater than in 1929.

Increased production, employment and earnings in 1952

raised the level of personal incomes. As indicated by preliminary data, personal incomes aggregated \$267,600,000,000 for the year, 5% more than in 1951.

Quarterly estimates revealed a gradual uptrend in national income and product during 1952 in the setting of a generally stable economic situation. Essentially, this was a continuation of the relative steadiness in over-all production and prices that had characterized the economy since the spring of 1951.

Some exception to this generalization was afforded by the several weeks' work stoppage in the steel industry during mid-summer. Its effects on the over-all business situation were principally manifest in statistics for the third quarter. These showed some unevenness in the flow of economic activity (as measured by monthly personal income) and dampened sales of hard goods throughout the economy. National defense outlays, business expenditures for new plant and equipment and consumer spending for durables, mainly automobiles, were all affected. Business activity recovered quickly, however, and by September stood well above the quarterly average, with producers operating against a substantially increased backlog of unfilled orders.

The strength and achievement of the economy in 1952 were evident not only from national income and product measures but in the improved relationship between supply and demand as the year progressed. Despite the growth in national defense outlays, the relaxation or elimination of numerous anti-inflationary controls was found possible. These included, among others, regulation X (housing credit), regulation W (consumer credit) and National Production authority controls on a long and expanding list of critical materials.

Meaning of Income and Product Measures.—National income, as measured by the U.S. department of commerce, is the sum of the net earnings of labour and property arising from the current production of goods and services by the nation's economy. It measures, therefore, the total factor cost of the goods and services produced by the economy. It includes income in kind as well as money income, but such receipts as relief, unemployment benefits and capital gains are excluded since they do not represent earnings derived from current productive activity. The national income consists of compensation of employees, the net income of unincorporated businesses, corporate profits, net interest and the rental income of persons.

Personal income is the current income received by persons from all sources, including transfers from government and business but excluding transfers among persons. Not only individuals (including owners of unincorporated enterprises) but non-profit institutions and private trust and welfare funds are classified as persons. Personal income differs from national income by the inclusion of transfers (such as relief, veterans' pensions and government interest disbursements) which are not in return for current productive services, and by the exclusion of earnings (social insurance contributions, undistributed corporate income and corporate income taxes) which are not actually received by persons in the current period.

Gross national product or expenditure is the market value of goods and services produced by the nation's economy, before deduction of depreciation charges and other allowances for business and institutional consumption of durable capital goods. Other business products used up by business in the accounting period are excluded. The gross national product consists of consumers' purchases of goods and services; the gross output of capital goods retained by private business, including the change in inventories; net foreign investment; and the goods and services purchased by governmental entities.

Gross National Product.—Purchases of goods and services by federal, state and local governments in 1952 totalled \$77,-

900,000,000, exceeding the 1951 total by more than \$15,000,000,000. (See Table I.) Nearly all of this large increase was accounted for by federal purchases for national defense. These amounted to about \$47,000,000,000 in 1952, two-fifths larger than in 1951. The share of gross national product absorbed by defense purchases in 1952 was 14%, compared with 10% in 1951 and 4½% in the second quarter of 1950, just prior to the attack on Korea.

The bulk of the expansion in national defense expenditures in 1952 occurred in hard goods—planes, tanks and other military equipment—and in military construction. Military and defense-related civilian pay rolls, together with the closely associated expenditures for food, clothing and other soft goods, showed relatively small increases and stabilized over the course of the year.

Personal consumption expenditures for goods and services totalled \$215,500,000,000 in 1952, about \$7,500,000,000 more than in 1951. Although much of this rise reflected higher prices, it is nonetheless significant that the actual flow of consumer products matched—in fact, slightly exceeded—the high 1951 volume despite expanding rearmament and the diversion of productive resources to national defense.

Consumer spending was substantially firm throughout 1952. Outlays for nondurable goods and for services changed little from quarter to quarter, and for the year as a whole registered moderate increases. Outlays for durable goods, at \$25,600,000,000 in 1952, were \$1,500,000,000 below the 1951 total; but, apart from some irregularity of movement in the latter half of 1952 occasioned by the effects of the steel strike on expenditures for automobiles, the aggregate of such outlays was relatively stable after the spring of 1951.

Among the major elements of gross national product, the only decline occurred in the area of private investment. Gross private domestic investment in 1952 amounted to \$51,000,000,000, down sharply from the 1951 record total of \$58,500,000,000.

The drop was centred in inventory accumulation as fixed investment was maintained at the high 1951 level. The value of

new private construction was stable, with both residential and the aggregate of other types of construction virtually unchanged from 1951. Producers' purchases of durable equipment increased slightly. On an industrial basis, business outlays for new plant and equipment rose markedly from 1951 to 1952 in the defense and defense-supporting sectors but declined in most others, such as food manufacturing, textile mill products, mining and trade and service.

Concentrated in the latter part of the year, business inventory accumulation in 1952 amounted to \$1,800,000,000, contrasted with \$10,300,000,000 in 1951. From the abnormally high rate of \$16,300,000,000 reached in the second quarter of 1951, inventory accumulation fell off sharply in the last two quarters of 1951, and was reduced to negligible proportions in the first half of 1952. Although other factors also were operative, this decline was mainly a voluntary and systematic downward adjustment. Stimulated by a slack in the rate of consumer spending following the buying waves which occurred after the outbreak of war in Korea, it was a key factor in the easing of inflationary pressures in the economy.

Distributive Shares of National Income.—Almost all of the increase in national income from 1951 to 1952 occurred in wages and salaries. (See Table II.) Advances in rental income of persons and net interest—two of the smaller components—also exceeded the over-all rate, but were not large in absolute amount.

On the other hand, both corporate earnings (corporate profits and inventory valuation adjustment) and noncorporate business earnings declined in relative importance. For nonfarm unincorporated business in the aggregate, income rose only slightly from 1951 to 1952, whereas in the corporate sphere and in farming it was about the same as in the previous year. However, as can be seen from the table, corporate profits in 1952 were somewhat lower than in 1951 when adjustment is not made for changing inventory valuation. This adjustment is required for national income purposes to eliminate inventory profit or loss, which is not part of earnings arising in production.

Wages and salaries increased by \$11,000,000,000 or more than 6% from 1951 to 1952, reaching a total of \$181,000,000,000. Almost \$4,000,000,000 of this rise was in government pay rolls (federal civilian and military and state and local combined), which advanced 13% to \$32,400,000,000. The pay-roll rise in the large private industry sector, from \$141,000,000,000 to \$148,000,000,000, amounted to 5%. Higher average hourly earnings, rather than changes in employment or in length of the work week, were mainly responsible for it.

National Income by Industries.—Estimates of national income by industries are shown in Table III. By far the largest income rise among the industries, both in absolute and relative terms, occurred in government. Within the private industry sector, the 1952 income total was little changed in agriculture and mining and moderately higher in the other industries. On balance, there was considerably less divergence in movement among the major industrial sectors in 1952 than in the previous year.

Disposition of Personal Income.—Estimates of personal income and its disposition among taxes, consumer spending and personal saving are provided in Table IV. As already noted, personal income increased 5% from 1951 to 1952. Disposable income—personal income less personal tax payments—totalled \$234,000,000,000 in 1952, 4% above the 1951 total. This rise was closely in line with the relative increases in consumer prices and population, so that real disposable income per capita was about the same in the two years.

With consumers continuing to exercise considerable buying restraint, the rate of personal saving in 1952 remained relatively high. It amounted to roughly 8% of disposable income, about the same as in 1951 but double the average of 4% for the period 1947-49. (See also BUDGET, NATIONAL; BUSINESS REVIEW; DEBT, NATIONAL; WEALTH AND INCOME, DISTRIBUTION OF.) (C. F. Sz.)

Income Tax: see TAXATION.

India. This republican self-governing member of the Commonwealth of Nations in southern Asia is a union of states. Areas and populations of the states are shown in the table.

Language: two main groups, Aryan or northern (including Hindi, used by approximately 47% of the total population; Bengali, 8%; Marathi, 7%; and Gujarati, 5%) and Dravidian or southern (including Telugu, 9%; Tamil, 7.5%; and Kanarese, 4.4%). English is the official language of the union, to be displaced by Hindi in the Devanagari script by 1964. Religion: Hindu (about 80%), Moslem, Christian, Sikh, Buddhist, Parsee, Jewish, etc. Chief towns (pop.: first figure, 1941 census; second figure, 1951 census): New Delhi* (cap., 93,960; 279,063); Delhi* (521,849; 914,634); Calcutta† (2,108,891; 2,549,790); Bombay (1,489,883; 2,840,011); Madras (777,481; 1,429,985); Hyderabad (739,159; 1,085,074); Ahmedabad (591,267; 788,310); Kanpur or Cawnpore (487,324; 704,536); Amritsar (391,010; 320,465); Lucknow (387,177; 497,594); Nagpur (301,957; 449,441). President in 1952: Rajendra Prasad; prime minister: Jawaharlal Nehru (q.v.).

History.—*The Elections.*—The year began with what was perhaps its most outstanding achievement, the successful conduct of elections to the union and state legislatures. Representative assemblies and the principle of election were not new to most parts of India, but the introduction of universal franchise in a country of long distances and, in many places, of difficult terrain, where illiteracy prevailed on such a large scale, was obviously a colossal experiment—and the registration of 176,000,000 voters created the largest electorate in history.

*New Delhi and Delhi are counted as two cities. Together they had in 1951 a total population of 1,193,697 and ranked as the fourth largest urban agglomeration of India.

†Greater Calcutta, including Howrah and suburbs, had in 1951 a total population of 3,490,281.

Source: India Record (London, April 25, 1951); provisional totals for the census held on March 1, 1951. No census was ever taken in Kashmir (q.v.), because of special conditions prevailing there, and in the part B tribal areas of Assam, which were not included in any former census and whose population was estimated as 560,000.

About 225,000 polling stations were established and 56,000 presiding officers supervised the balloting. Voting began in Oct. 1951 and the last results were announced in March 1952. Fourteen all-India parties contested. Opposition to the Indian National Congress, the party in power, proud of its past record and claiming to be a progressive centre party, came mainly from the Socialists and the Communists on the left, and the Jan Sangh and allied groups, the representatives of orthodox Hinduism, on the right. There was also the newly formed Kisan Mazdoor Praja party (merged in August with the Socialist party), composed mainly of former Congressmen who claimed to abide by the ideals which they said Congress had abandoned on assuming office. More than 17,000 candidates contested 4,505 seats. Every available medium of propaganda was used, but on the whole there was moderation and restraint, and 107,580,000 voters went to the booths. Polling averaged 40% in the towns and 60% in the villages, and the women displayed a keen interest. In the house of the people, Congress gained 363 seats, polling 44.85% of the total vote, the Communists 23 seats, the Socialists 12, the K.M.P. 9, the Jan Sangh 3, other splinter groups 39 and independents 40. In all the 22 state assemblies and in the 3 electoral colleges of Kutch, Manipur and Tripura Congress was returned as the largest single party and in every state except the Patiala and East Punjab States Union was able to form a ministry. This success was largely the achievement of Jawaharlal Nehru, who undertook an election tour of more than 25,000 mi. and addressed mammoth open-air meetings in almost every part of the country. The reactionary and communal parties experienced an utter failure. In the council of states, Congress gained 146 seats. Rajendra Prasad was elected president, defeating the other four candidates by a huge majority, and Sarvepalli Radhakrishnan was unanimously elected vice-president. On May 13 the new parliament met and Nehru announced his new cabinet of 15 members.

Food.—The chief problem confronting the government was clearly food. In 1951 there was no increase in production or in procurement, and the new year began with a failure of crops

Above: AGRICULTURAL STUDENTS examining a steel plow head which was helping to modernize Indian agriculture in 1952 by replacing the centuries old wooden plow. The students were being trained at a school in Etawah, United Provinces, to do practical teaching among farmers on how to increase crops and improve livestock

Above: JAWAHARLAL NEHRU speaking at the formal opening of a dye and drug plant at Parnera, India, in 1952. It was a joint Indian-American enterprise, and its products would be used by industries in both nations

Above: RAT TRAPS ready for distribution in Calcutta in 1952. An important part of a campaign to prevent bubonic plague in India was to exterminate rats carrying the flea-borne disease

Below: MOSLEM WOMEN arriving at a polling place in Delhi, India, to vote in the parliamentary elections of 1952. They are shown drawing up in a cycle-ricksha, veiled in their traditional burka

in Uttar Pradesh, Rajasthan, Kutch and the Punjab. There was drought for the fifth successive season in certain districts in Madras, and floods ravaged Bengal, Assam and Bihar. But even so the government decided in February to plan for the future rather than for the immediate present, and to withdraw subsidies for all food grains except milo, which was consumed mainly by the poor. Fortunately India, for the first time, had a large stock of food grains which was continuously increased by imports (from 1,330,000 tons in January to 3,700,000 tons in June). This, along with a good wheat harvest, improved procurement, and heavy rains in south India in May enabled a drastic revision of policy in June. Madras, Bihar, Uttar Pradesh, Saurashtra, Hyderabad and Mysore abolished rationing and price control but established fair-price shops as a precautionary measure. In Bengal free movement of grains between districts was allowed, but the government of India assumed the responsibility for feeding Calcutta.

In August the agricultural situation was literally darkened by an invasion of locusts which infested 60,000 sq.mi. in Rajasthan and slowly moved eastward.

Foreign Aid.—The necessity of increasing agricultural production led to a willingness on the part of India to receive financial assistance from the United States. Pursuant to the general agreement for technical co-operation signed on Dec. 28, 1950, a specific agreement was signed on Jan. 5, 1952. The U.S. agreed to provide \$50,000,000 to be jointly administered by the two governments and used for the execution of agreed projects, the government of India making supplementary funds available. During the year 11 operational agreements were signed, allocating the money given by the U.S. and providing for the expenditure of \$86,000,000 by the Indian government. The projects covered the supply of fertilizers and iron and steel, locust control, soil and forest research, desert control, development of marine fisheries and ground-water irrigation, malaria control, training of village-level workers, development of community projects and assistance in the execution of river valley schemes. Particular emphasis was laid on the community development projects to which the government of India allocated nearly 85% of its expenditure. Fifty-five project areas were chosen, each containing about 300 villages. The objective was to develop, within three years, the material and human resources of the area through the co-operative endeavour of the inhabitants with active assistance from the state. Work began in June in 44 project areas. An extensive survey was carried out and field operations commenced in October. To hasten these projects the Ford foundation gave \$1,200,000 for a program of rural extension service and a further \$1,873,485 for training centres for community development. Five such centres were started and a community project covering 100 villages begun in Pepsu. India and the U.S. together undertook the largest rural development program in the world.

Foreign Policy.—This co-operation had no obvious political implications, but it decreased Indian suspicions of the United States and fostered an appreciation of U.S. motives. Relations with the other powers continued to be cordial. The Chinese government sold 100,000 metric tons of rice to India. An Indian cultural delegation reached China in April and during their tour of six weeks were received everywhere with enthusiasm. In January, the U.S.S.R.'s sudden intervention—for the first time in four years—in the Kashmir dispute before the U.N. Security council awakened curiosity in India as to Soviet motives, but there was no sequel. The Soviet Union offered to sell industrial equipment to India, and in April Joseph Stalin accorded the retiring ambassador, Sarvepalli Radhakrishnan, the unusual courtesy of an interview. On June 9 India, which had refused to sign the multilateral treaty concluded at San Francisco,

signed a bilateral peace treaty with Japan, waiving all reparation claims and restoring Japanese property located in India. Japan was to be accorded "most favoured nation" treatment among countries not in the commonwealth, and an agreement regulating fishing rights was to be reached later. Trade agreements were signed with western Germany, Italy, Norway, Austria and Finland, and a loan, the amount to be settled later, was offered to Nepal.

India continued to be an active member of the United Nations. It persevered in its efforts to evolve a lasting settlement in Korea, supported the moves to bring the Tunisian problem before the Security council and to summon a special session of the general assembly for consideration of the problem and, when these efforts failed, raised the matter at the annual session of the general assembly in October. Regarding the treatment of Indians in South Africa, India suggested in January the appointment of a commission of three members to help India and Pakistan reach an agreement with the South African government. The general assembly accepted the suggestion, but the South African government refused to act on it and no advance was made. In October India brought before the general assembly, as an independent issue, the agitation of the non-Europeans in South Africa.

In Ceylon, the general elections in May revived the issue of the voting rights of the 800,000 Indian residents. Many of them were disenfranchised by the decision of the government of Ceylon that only those Indians who had registered themselves as citizens and taken the oath of allegiance could vote. The government of India refused to raise the question before the U.N. but requested the government of Ceylon to mitigate the injustice done to those taken unaware by the suddenness of the elections. The government of Ceylon refused to amend the law but relaxed the rules pertaining to registration.

Relations with Pakistan formed the chief source of concern. In May the International Bank for Reconstruction and Development sponsored talks in Washington, D.C., between engineers of the two countries about the utilization of the waters of the Indus, but with no result. In June India complained to the International Civil Aviation organization about Pakistan's refusal to grant direct air access to Afghanistan. Pakistan insisted on restricting the free movement of persons between East Bengal and India, and a passport system came into effect on Oct. 15. In August a trade pact was signed, but it was more an assurance that trade would not be discontinued than any advance on the existing position. Coal and jute, the two most important commodities of trade between the two countries, were beyond its purview.

Kashmir.—Above all there was the question of Kashmir. In January Frank Graham, the U.N. mediator, reported to the Security council that India had agreed to withdraw an additional 7,000 troops and Pakistan had accepted a proportionate reduction: the points still at issue were the time and scope of demilitarization and the quantum of forces to remain thereafter, and the time for the formal introduction of the plebiscite administrator. Graham suggested that the most practical means of demilitarization would be a continuous co-ordinated process leaving at the end on both sides the smallest possible number proportionate to the number at the time of the cease-fire. This proposal, however, granting equal status and military parity to Pakistan, was unacceptable to India. That country was ready to withdraw the bulk of its forces, but insisted on keeping a sufficient number to safeguard Kashmir from foreign invasion and internal disturbances. The U.N. extended the period of Graham's mission and he visited Delhi and Karachi in March. He said he had found a general lessening of tension, and both countries had withdrawn their troops from the border.

But he reported that he could make no further headway without the help of the plebiscite administrator, as further demilitarization would affect the prerequisites of a plebiscite. India agreed to withdraw unconditionally one division of 18,000 men, but Pakistan contended that even then India's forces would greatly exceed her own. In May Graham resumed negotiations and after preliminary discussions with the delegates of the two countries at Lake Success convened a conference of ministers at Geneva, Switz., in August. The discussions lasted two weeks but led to no agreement.

The dispute with Pakistan and the pledges given to the U.N. gave Kashmir a special—and somewhat anomalous—position among the states of India. Alone among the member states a national movement grew up there, and in July the government of India allowed it to elect its head, to fly its own flag alongside and subordinate to the national flag, to impose restrictions on Indian citizenship and the fundamental rights guaranteed by the constitution and to give restricted application to the powers of the president and the supreme court. Foreign affairs, communications and defense were the responsibility of the union government; residuary powers were vested in the state.

Home Affairs.—The duty of the government to maintain law and order was emphasized by some of the events of the year. Communal animosity was always beneath the surface and ready to show its angry face at the slightest provocation. Minor riots broke out in Delhi in May and in Uttar Pradesh in August. In Saurashtra and Rajasthan some of the dispossessed princes and estate-holders gave tacit encouragement to violence and robbery, and throughout India the Communist party encouraged discontent and agitation. In the elections they had polled only 4,712,009 votes (4.45% of the total), but they made up in organizational efficiency what they lacked in numerical strength. Now avowedly wedded to parliamentary methods, they yet had a long record of terrorist endeavour and, on their own confession, were still in possession of arms. To curb all these elements the government secured from the new parliament a renewal of the Preventive Detention act till the end of 1954.

Planning and Production.—In July 1951 was published the draft five-year plan, envisaging a development expenditure on public account of Rs. 17,930,000,000, with emphasis on irrigation and power projects and an increase in agricultural productivity. In March 1952 it was revised to become a six-year plan, with a public expenditure of Rs. 23,337,000,000, of which more than a quarter was allocated to agriculture and irrigation and power projects and another quarter to the development of communications. (See also PAKISTAN; TIBET; UNITED NATIONS.) (S. GL.)

Education.—Recognized schools (1949-50): primary 206,270, pupils 17,450,000, teachers 517,585; secondary 19,705, pupils 4,718,000, teachers 195,820; vocational 48,730, pupils 1,395,000, teachers 24,413. Unrecognized schools 8,947, pupils 362,000, teachers 10,553. Universities 28, students 351,000, professors and lecturers 18,730.

Finance and Banking.—Budget (1951-52 est.) revenue Rs. 4,011,400,000, expenditure Rs. 3,754,300,000; (1952-53 est.) revenue Rs. 4,250,000,000, expenditure Rs. 4,062,000,000. National debt (March 1952) Rs. 25,874,000,000. Currency circulation (Aug. 1952) Rs. 11,008,000,000. Scheduled bank deposits (Aug. 1952) Rs. 615,000,000. Gold and foreign exchange (Aug. 1952) U.S. \$1,984,000,000. Monetary unit: rupee, with an exchange rate of Rs. 13.33 to the pound sterling and Rs. 4.775 to the U.S. dollar.

Foreign Trade.—(1951) Imports Rs. 8,648,000,000, exports Rs. 7,840,000,000. Main sources of imports (1951-52): U.S. 30%; U.K. 16%; Pakistan 12%; Iran 3%. Main destinations of exports: U.K. 26%; U.S. 18%; Pakistan 6%; Australia 6%. Main imports: grains, pulses and flour 27%; raw cotton 16%; machinery and vehicles 17%. Main exports: cotton yarns and manufactures 8%; jute manufactures 39%; tea 13%.

Transport and Communications.—Roads (1950): 245,000 mi. Licensed motor vehicles (Dec. 1951): cars 145,290; commercial vehicles 125,383. Railways (1952): 33,343 mi. Traffic, first-class railway (April 1, 1951, to March 31, 1952): passenger-miles 39,030,200,000; freight ton-miles 28,965,900,000. Shipping: merchant vessels, 100 gross tons and over (July 1951) 183; total tonnage 455,329; vessels with cargo in external trade (net registered tons, 1951) clearances 7,682,000. Air transport (1951): passenger-miles 264,658,000; cargo ton-miles 12,459,000; mail

carried (tons) 3,206. Telephones (1951): 168,397. Radio licences (1951) 566,500.

Agriculture.—Main crops (metric tons, 1951): barley 2,362,000 (1952 est.) 2,141,000; maize (est.) 2,017,000; rice 20,269,000 (1952 est.) 20,562,000; wheat 6,590,000 (1952 est.) 7,020,000; grain 3,766,000 (1952 est.) 3,919,000; potatoes 1,700,000; sugar (raw value) 5,616,000 (1952 est.) 5,895,000; coffee 200,000; tea 300,000; tobacco 256,000 (1952 est.) 214,000; cottonseed (est.) 1,214,000; peanuts 3,437,000 (1952 est.) 3,037,000; linseed (est.) 380,000 (1952 est.) 300,000; rapeseed (est.) 179,000; sesame seed 500,000; cotton (bales) 2,926,000 (1952 est.) 3,041,000; jute (bales) 3,301,000 (1952 est.) 4,678,000. Livestock (1951): buffaloes 42,854,000; other domestic cattle 130,298,000; sheep 39,975,000; pigs 4,173,000; goats 47,121,000; chickens 65,625,000; other domestic animals 3,478,000. Fisheries: total catch (1949) 513,764 metric tons.

Industry.—Index of industrial production, June 1952 (1946=100), was 118, compared with 116.7 in June 1951. Fuel and power (1951): coal 34,858,000 metric tons; electricity 5,870,000,000 kw.hr.; crude oil (1950) 252,000 metric tons. Raw materials (metric tons, 1951): pig iron 1,853,000; copper (refined) 7,190; lead (refined) 900; aluminum (smelter) 3,900; manganese ore (1949) 656,000; rubber 17,400; salt (1950) 2,600,000; gold (1950) 188,000 fine oz. Manufactured goods (1951): cement 3,251,000 metric tons; cotton yarn 588,500,000 yd.; cotton fabric 3,811,000,000 m.; (1950) jute manufactures 850,000 metric tons; sheet glass 9,600,000 sq.ft.; paper and board 111,000 metric tons; cars and trucks 14,600; bicycles 104,000; radio receivers 44,500.

Indiana. An east north central state of the United States, popular name, "Hoosier," Indiana was admitted to the union Dec. 11, 1816, as the 19th state. Total area of the state is 36,291 sq.mi., including 86 sq.mi. of inland lakes and rivers. The population of the state according to the 1950 census was 3,934,224, a gain of 14.8% from 1940; 59.9% of the population was defined as urban. Capital: Indianapolis (pop. 1950 census, 427,173), the largest city. Other cities: Gary (133,911); Fort Wayne (133,607); Evansville (128,636); South Bend (115,911); Hammond (87,594); Terre Haute (64,214); Muncie (58,479); East Chicago (54,263); Anderson (46,820).

History.—The general assembly did not meet in 1952. Demands for a special one-day session to simplify voting procedures for servicemen were refused by Gov. Henry F. Schricker. Other state officers for the year remained the same as in 1951: John A. Watkins, lieutenant governor; Leland L. Smith, secretary of state; William L. Fortune, treasurer; Frank T. Millis, auditor; J. Emmett McManamon, attorney general; and Wilbur Young, superintendent of public instruction. Party conventions in June chose for gubernatorial candidates Democrat John A. Watkins and Republican George N. Craig. Henry F. Schricker, Democrat, entered the race for U.S. senator against William E. Jenner, Republican. The centennial of the Indiana state fair was celebrated Aug. 28 to Sept. 6 and enjoyed an unusually prosperous ten-day session, establishing new attendance records. On Sept. 28, 1952, the Larue D. Carter Memorial hospital, the state's first specialized institution for screening of mental illnesses, was dedicated. Construction of the \$5,000,000 unit of the Indiana University Medical centre was begun in 1948.

Education.—The number of public schools in the state in 1952 was approximately 2,550. Enrolment in the elementary schools was 409,712, with 14,595 teachers. Enrolment in the junior high schools was 111,108, with 1,858 teachers. Enrolment in the high schools (grades 9-12) was 173,607, with 10,084 teachers. Parochial schools had an enrolment of 71,702. For the year 1951-52 the state appropriated \$58,000,000 for the support of schools, in addition to the sums provided by local units of government. The state provided \$22,033,500 for the operating expenses of the four state colleges. There were 64,599 enrolled in 38 Indiana colleges and universities in 1951-52.

Social Insurance and Assistance, Public Welfare and Related Programs.—In 1951-52 the state's welfare program cost \$39,261,347.71 of which \$19,236,045.53 was furnished by federal funds, \$9,586,226.04 by state funds and \$10,439,076.14 by county funds. Old-age assistance cost \$22,505,972.94, blind assistance \$926,697.84 and aid to dependent children \$7,562,510.68. In addition, child welfare cost \$2,368,145.02 from state and county funds. Receipts of the state for unemployment insurance for the year ending June 30, 1952, were \$30,386,498.52. Benefits paid out were \$18,714,453.24.

In 1952 the state maintained nine institutions for mental patients including an epileptic village; ten homes, hospitals and schools; and four penal and correctional institutions. As of June 30, 1952, inmates of mental institutions totalled 14,323 and of penal correctional institutions, 6,926.

Communications.—The total mileage of state highways in 1952 was

Table I.—Principal Crops of Indiana

	Indicated 1952	1951	Average 1941-50
Corn, bu.	227,750,000	241,415,000	215,425,000
Wheat, bu.	39,470,000	23,529,000	29,828,000
Oats, bu.	50,698,000	50,875,000	47,212,000
Soybeans, bu.	33,322,000	36,448,000	27,718,000
Potatoes, bu.	2,600,000	3,360,000	4,348,000

Table II.—Manufacturing in Indiana

	Employees 1952	1951	Wages 1951 (in thousands of dollars)	Value added by manufacture 1951
Total manufactures	568,300	557,208	\$1,935,641	\$3,832,892
Food	43,900	40,052	113,264	336,179
Apparel	16,900	17,817	35,764	56,223
Furniture	23,700	24,232	69,546	114,776
Printing	18,000	17,537	59,211	104,087
Chemicals	19,300	17,231	72,211	268,653
Petroleum and coal products	17,200	17,733	69,681	167,695
Rubber	17,300	14,733	49,033	83,056
Stone	22,500	20,180	62,989	136,673
Transportation equipment	108,600	92,609	365,791	619,922
Primary metal industries	92,500	86,061	326,947	627,491

10,616, with county roads totalling 74,769 mi. The state highway expenditure for roads amounted to \$26,831,870.66 during the fiscal year 1951-52. Steam railroad first-line trackage measured approximately 6,600 mi. There were 90 mi. of electric railways. The estimated number of telephones in the state on Dec. 1, 1951, was 1,062,346. There were 113 commercial airports, 4 military airports, 98 personal landing fields and 2 seaplane bases in the state as of Oct. 1, 1952.

Banking and Finance.—On Oct. 1, 1952, there were 360 state banks and trust companies with 77 branches. On June 30, 1952, the total resources of these banks were \$1,673,308,699.53. Deposits totalled \$1,557,904,067.90. There were 125 national banks and 42 branches on June 30, 1952. Their midyear resources amounted to \$2,073,962,000 and deposits totalled \$1,941,767,000. State savings and loan companies numbered 161 and their assets were \$254,974,945.54 as of Dec. 31, 1951. The state's 71 federal savings and loan associations listed assets amounting to \$362,135,000 as of Dec. 31, 1951.

Agriculture.—The year 1952 was a better than average year for corn, wheat, oats, soybeans and tobacco, although in some cases the 1952 estimates fell below the figures for 1951.

Manufacturing.—Since 1950 census figures were released only limited manufacturing statistics had been compiled by state agencies. Total wages and value added by manufacturing figures were not available for 1952. The first column in Table II represents estimates of all persons gainfully employed as of June 1952. (E. Dr.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Indiana in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Indiana ranks 17th among the states in the value of its mineral output, with 1.41% of the U.S. total.

Table III.—Mineral Production of Indiana

Mineral	1950 (Short tons, except as noted)		1949	
	Quantity	Value	Quantity	Value
Clays	1,159,000	\$ 1,396,000	1,023,000	\$ 1,198,000
Coal	19,957,000	79,302,000	16,550,000	66,988,000
Coke*	8,256,000	138,881,000	7,533,000	122,528,000
Iron, pig*	7,013,000	297,569,000	6,028,000	248,700,000
Petroleum (bbl.)	10,699,000	29,530,000	9,696,000	26,860,000
Sand and gravel	9,723,000	7,516,000	8,887,000	6,695,000
Stone	6,995,000	20,686,000	6,332,000	15,228,000
Other minerals	28,202,000	24,056,000
Total	\$166,632,000	\$141,025,000

*Values for processed materials are not included in the totals.

Indians, American. No official estimate of the Indian population in the United States was compiled in 1952. The figures of 400,000 Indians in the United States and 35,000 Indians, Eskimos and Aleuts in Alaska had been used in official documents of the bureau of Indian affairs for several years.

The year 1952 saw a continuing effort in the administration of Indian affairs to find ways by which the responsibility of the federal government for the protection and welfare of the Indian people could be reduced. The effort was not designed to diminish the protective legal devices set forth in treaty and statutory provisions or to lessen the welfare services provided for Indians. Rather, the purpose was to seek adequate substitute federal or state agencies or Indian community organizations to which these responsibilities might be transferred.

WATER COLOUR of an Indian tribal dance painted by Merton Numkena, a Hopi Indian, aged 16. It was exhibited at the San Francisco Museum of Art in 1952, with a collection of art work by Hopi, Navaho, Havasupai and Apache Indian children, aged 6 to 18

As a principal means of exploring this objective of reducing the federal function in Indian affairs administration, a division of program was established within the bureau of Indian affairs. This division would work with Indian leaders in their communities and with bureau personnel in the formulation of plans designed to improve the economic status of the Indians and a step-by-step withdrawal of the bureau from the supervisory role which it had played in the management of their affairs.

In the case of the Indians of the state of California and the numerous small bands under the former Grand Ronde-Siletz agency of western Oregon, planning for federal withdrawal advanced to the point of introducing legislation to provide necessary authority. The California bills (S. 3005, H.R. 7490 and H.R. 7491) would accomplish complete federal withdrawal in from three to five years, while the legislation for the Oregon Indians would complete the same process within one year. Hearings were held on these bills in the 82nd congress, but action was not completed.

Transfer of Indian children to public schools and the turning over of federal school plants to public-school districts continued to be emphasized. Plans for transferring about 25 federal Indian schools had advanced to the stage where it was expected that formal action could be completed during fiscal year 1953. In Alaska, where the bureau operated 92 day schools and 3 boarding schools, a long-term plan was developed by which all of these schools would be transferred to the territorial school system by 1960.

None of the 62 hospitals and 10 outpatient dispensaries operated by the bureau was transferred out of its jurisdiction during the year, but public law 291 (approved April 3, 1952) authorized such transfers, and it also authorized the admittance of non-Indian patients in Indian service hospitals in areas where other hospital facilities were not available. The bureau

also obtained an increase of funds for contracting with hospitals outside the Indian service for the health care of Indians.

Law enforcement was another field in which the bureau sought, through consultations with Indian tribes and state authorities, to lessen its administrative responsibility. Bills were introduced in congress, with bureau sponsorship, to transfer civil and criminal jurisdiction on Indian reservations to the states of California, Minnesota, Nebraska, Oregon, Washington and Wisconsin. Final action was deferred.

An important modification of a long-standing regulation governing Indian trust property was effected during the year. The modification would permit Indians to mortgage lands held in trusteeship by the secretary of the interior, and thus for the first time to become eligible for loans from the Farmers Home administration, the Veterans administration and other lending agencies which require the holding of land as security. It was estimated that Indians were obtaining credit at the rate of \$20,000,000 per year from sources other than the bureau of Indian affairs. The loan program conducted by the bureau during the year 1952 had outstanding loans of \$21,000,000, an amount approximately equal to the nonbureau credit volume.

In an important decision affecting Indians prosecuting claims against the United States, the court of claims reversed the Indian Claims commission (in *Ernest Risling et al. as the Representative and on the Relation of the Indians of California v. United States*) and held that it was the intention of congress in passing the Indian Claims Commission act to permit groups of Indians other than tribes or bands to present claims under the act. (D'A. Mc.)

Indochina. A country of southeast Asia bounded north by China, west by Burma and Thailand and south and east by the South China sea, Indochina is divided into three associated states of the French union. Areas and populations are:

	Area (sq.mi.)	Population (1936 census)	(1948 est.)
Vietnam	126,608	18,972,000	22,663,000
Tonkin (Bac-Ky)	44,660	8,700,000	9,851,000*
Annam (Trung-Ky)	56,974	5,656,000	7,184,000*
Cochin-China (Nam-Ky)	24,974	4,616,000	5,628,000
Cambodia	69,866	3,046,000	3,748,000
Laos	89,320	1,012,000	1,169,000†
Total	285,794	23,030,000‡	27,580,000

*1943 estimate. †1947 estimate. ‡Including 326,000 Chinese and 42,000 Europeans; in 1946 there were only 26,000 Europeans, including 23,000 French and *assimilés* (Eurasians with French citizenship).

Population: Vietnam, mainly Annamites; Cambodia, Cambodians or Khmers; Laos, Thais; southern highlands of Annam and Laos, Mois (backward Indonesians akin to Bornean Dayaks); northern highlands of Laos and Tonkin, tribes of various origins (Man, Meo, Kha); 75% of the Indochinese population lives on the coastal plain; i.e., on 10% of the total area, the Red river delta (Tonkin) and the Mekong delta (Cochin-China) being among the world's most densely populated areas. Language: Vietnam, mainly Annamese; Laotians speak a Thai dialect different from that of Siamese proper. Religion: Vietnam, mainly Confucian; Cambodians are Buddhist; Mois, pagan. Chief towns (pop., 1949 est.): Saigon, capital of Vietnam, with seaport of Cholon (1,700,000); Hanoi (166,000); Haiphong (92,000); Phnom-Penh, capital of Cambodia (128,950); Vientiane or Vientchan, capital of Laos (13,700). Rulers and commissioners in 1952: Vietnam: ruler, Bao Dai; high commissioner, Jean Letourneau; Cambodia: ruler, King Norodom Sihanouk; commissioner, Pierre Risterrucci; Laos: ruler, King Sisavang Vong; commissioner, Miguel de Pereira.

History.—On Jan. 11, 1952, Gen. Jean de Lattre de Tassigny, to whose energetic year of leadership the Franco-Vietnamese forces owed their recovery after the reverses of 1950, died at

Neuilly, near Paris, after a short illness. During Jan.-Feb. 1952 the battle for Hoabinh continued. The Viet Minh harassed the Franco-Vietnamese supply line to Hoabinh so that 18 battalions had to be used to protect them, and the Viet Minh were able meanwhile to reinfiltate into the Red river delta with three divisions. The Franco-Vietnamese troops withdrew from Hoabinh (Feb. 22) and engaged the Viet Minh forces in the delta. Fighting and mopping up there lasted three months.

On Jan. 23 Jean Letourneau, the French minister in charge of relations with Indochina, left for Saigon on a visit of friendship to the associated states. On April 1 he was made high commissioner in succession to General de Lattre, remaining a member of the French cabinet. Gen. Raoul Salan was appointed commander in chief of the armed forces in Indochina. The new high commissioner visited Washington, D.C., in June and reported, on his return to Paris, that deliveries of U.S. aid to Indochina were to be accelerated, that by the beginning of 1953 all material allocated for that year would have been assured and that, because of the expansion of the Vietnamese army, some French units would be withdrawn from Indochina in 1952. Gen. Nguyen van Hinh was appointed chief of staff of the Vietnamese army by Bao Dai (March 8). In the early months of 1952 the strength of the French expeditionary army in Indochina was estimated at 173,000 and that of the Vietnamese forces (regulars and irregulars) at 112,000. The Viet Minh were estimated to have 350,000 troops in the field, nearly half of whom were in regular formations including five organized divisions. Aid from China was being furnished to the Viet Minh through technical advisers, arms and training facilities in south China.

Political developments inside Vietnam in 1952 were marked by the resignation of the prime minister, Tran Van Huu, in June, and the formation by his successor, Nguyen van Tam, a former chief of police and minister of the interior, of a "national coalition" of 12 ministers (6 from north Vietnam, 5 from south Vietnam and 1 from central Vietnam). The new prime minister announced a political program, the principal features of which were: the formulation of a budget (the first since the creation of the Vietnam state); an agricultural reform project; the formation of a provisional national council as an interim step prior to the holding of elections for a parliament; the introduction of a labour code; and a proposed law to allow the formation of trade unions. The budget envisaged an expenditure of 8,600,000,000 piastres in 1952 of which nearly 60% was to be on the armed forces. The relative economic weakness of Vietnam was clearly illustrated by the fact that the proportion which it would contribute to the total would be about 51%. French financial help and United States economic aid would provide most of the remainder. In addition France was to send aid in kind to Vietnam worth 2,700,000,000 piastres and the United States was to provide military help worth 600,000,000 piastres. Vietnam's contribution to the military budget (1,750,000,000 piastres or 37%) was, however, a considerable increase on its past provision. In July and August a seven-point land reform program was announced which was to fix maximum rents for land; to set up an agricultural bank with a capital of 50,000,000 piastres for financing the purchase of land up to ten hectares per family from landlords by land-starved peasants; to provide for the development of peasant co-operatives; and to institute technical services for agriculture. On Sept. 1 the new national council met for the first time. It consisted of 30 appointed members drawn from the three regions of Vietnam and from among officials, professional men and industrialists, and was to have consultative functions. A month earlier the prime minister had announced that early in 1953 this provisional body would be replaced by a national assembly brought into being

by indirect elections—the elected village councils choosing electoral colleges which, at province level, would elect representatives for the national assembly. (See also *ARMIES OF THE WORLD*.) (D. A. SN.)

Education.—Schools (1947): primary 679, pupils 264,816; secondary 37, teachers 302, pupils 12,105. Technical and higher educational institutions 32, teaching staff 101, students 2,101.

Finance.—Budget (1950 actual): expenditure, excluding cost of military operations, 1,385,000,000 piastres. Monetary unit (common to all three states): piastre = 17 metropolitan francs. U.S. \$1 = 350 metropolitan francs in 1952.

Foreign Trade.—Imports (1951): 6,276,000,000 piastres; exports (1951) 2,784,000,000 piastres. Principal exports: rubber, rice, pepper and pimentos, maize, kapok, coal.

Transport and Communications.—Serviceable roads (1950): 7,000 km. Motor vehicles (1950): 29,700. Ships entered (Saigon-Cholon, 1950): 854. Aircraft landed (1950): 822. Railways (1950): 72,000,000 passenger-kilometres; 130 freight ton-kilometres. Telephones (1949): 9,129. Radio receiving sets (1949): 27,000.

Agriculture.—Main crops (metric tons, 1948, except as indicated): rice (1949) 4,600,000; sugar cane 200,000; sugar (raw) 18,000; cassava 35,000; dry beans 21,000; peanuts 5,000; cottonseed 1,000; coffee 312,000; tea 1,000; tobacco 8,200; cotton ginned 1,000; rubber (1949) 43,700. Livestock (1948-49): horses 13,000; cattle 1,682,000; pigs 2,258,000; sheep 20,000; goats 26,000; buffaloes 1,290,000. Meat production (1948): 42,000 metric tons.

Industry.—Production (metric tons, 1949): coal 499,000; tin concentrates 60,000; salt 114,000.

Indonesia. An Asian republic (former Dutch East Indies, except Dutch New Guinea), Indonesia consists of two groups of islands: (1) Java and Madura; (2) Sumatra, Borneo, Riouw-Lingga archipelago, Banka, Billiton, Celebes, Molucca archipelago and Lesser Sunda Islands. Area (excluding Dutch New Guinea): 583,479 sq.mi. Pop. (mid-1951 est.): 76,500,000; two-thirds live on Java. Language: Bahasa Indonesia, an adaption of Malay, was being propagated as the official language; 25 major languages and c. 250 dialects were spoken. Religion: Moslem c. 90%, Christian 3.4%, Hindu 1.4%. Chief towns (pop., 1951 est.): Jakarta (cap., 2,800,000); Jokjakarta (1,848,886); Surabaya (714,898); Bandung (659,213); Semarang (310,942); Surakarta or Solo (266,365). President in 1952: Achmed Sukarno; prime ministers in 1952: Sukiman Wirjosandjojo and (from April 1) Wilopo.

History.—The general situation in 1952 was marked by impending crises, financial and economic in the first place, but spreading to other sectors of public life as well. In his address on Independence day (Aug. 17) President Sukarno himself mentioned a loss of faith in democracy and in the government, a crisis of internal security and a crisis of morality in the public service.

The first acute difficulties, however, arose over a matter of international policy. In January the minister for foreign affairs and the U.S. ambassador had reached agreement on U.S. assistance to Indonesia on the basis of the Mutual Security act. The news soon set in motion a strong opposition in parliament and in the press, preoccupied by vague fears that such assistance might detract from Indonesia's policy of neutrality between the western democracies and the soviet bloc. On Feb. 23 this opposition forced the Sukiman cabinet to resign.

At that time negotiations between Indonesian and Dutch delegations had been going on for several months at The Hague for a general revision of the 1949 agreements and about the status of Dutch New Guinea, which territory the Indonesian government still desired to annex. The resignation of the cabinet caused an indefinite suspension of these talks. The program of the new Dutch cabinet that took office in September, as reflected in the queen's speech at the opening of the parliamentary sessions, indicated that the Netherlands was no longer prepared to consider Indonesian claims to New Guinea, and this made the success of further negotiations on an amiable settlement of the other questions between the two countries doubtful.

A new Indonesian cabinet formed by Wilopo took office on April 1, based like those before on a coalition of the Moslem

"DIFFICULT FENCE TO WALK," a 1952 cartoon by Sweigert of the *San Francisco Chronicle*

(Masjumi) party and the Nationalists, with a sprinkling of members from smaller groups, including this time the Socialist party. Though the Mutual Security agency deal was replaced by an arrangement for aid via the U.S. Technical Cooperation administration based on the Point Four program, the new minister for foreign affairs inherited from his predecessor another irksome problem, viz., the ratification of the San Francisco peace treaty with Japan, which Indonesia had signed, though other Asian nations indulging in neutrality, like India, had abstained. After a period of many months during which the matter was left dormant, the political mood appeared to change and eventual ratification looked more likely. The news which broke in September that Indonesia had applied for participation in the Colombo plan for southeast Asia sponsored by the British Commonwealth countries was another indication of a more co-operative trend toward the western nations.

It appeared that both the sanguine expectations about a higher standard of life and the suspicions against western influence which accompanied the revolution slowly began to make place for a more realistic outlook in this third year of Indonesian independence. Various unfavourable prospects made such a reorientation urgent. The internal security situation deteriorated in some areas, such as west Java, where armed gangs sometimes operated in strengths of several hundreds, and south Celebes. In other parts the opposite was true, and there martial law was partially withdrawn. Labour unrest in the agricultural and urban industries reappeared, and strikes flared up in spite of the compulsory mediation prescribed by law. Such conflicts were partly promoted by the Communist-led federation of labour unions, though the general tactics of the Communist party for the time being followed a nationalist rather than a revolutionary trend.

The general financial and economic difficulties of the state overshadowed these anxieties. While the "Korea boom" lasted, some reserves in the form of gold and foreign exchange had been laid up and government indebtedness to the central bank had been redeemed to a considerable extent; these reserves proved useful when the recession set in. The foresight thus displayed

by the government had been extended neither to restraint in the purchasing policies abroad of the service departments nor to timely scaling-down of the huge bureaucracy. The bills for these omissions weighed heavily on the financial scales of 1952 and a budgetary deficit of about 4,000,000,000 rupiah was expected on a total expenditure of 12,800,000,000 rupiah.

About 35% of the Indonesian revenue consisted of customs receipts, and customs duties and excise accounted for 65% of tax revenue. These figures indicate the close relation of Indonesia's finances, as of an exporting country of raw materials, to the price levels in world markets. The reduction in values of its main exports (rubber, tin and copra) which began in 1951 consequently upset the balance. Faced with these developments, the government embarked in August on a determined "austerity" policy, by penalizing all but the bare necessities of life through levies of varied severity on imports of luxury goods. Simultaneously a campaign for increased production was launched. The fact that Indonesia was no longer able, as it had been before World War II, to export rice or even to feed its own increasing population led some experts to advocate concentration of the main effort on agriculture. Others, however, put the emphasis on planned industrialization. In between these divergencies, the vital part of western private enterprise in the country's economy inevitably drew more sympathetic attention than hitherto. The necessity of attracting additional foreign investments led the government to consider a firm and liberal investment policy. It remained to be seen to what extent the government could succeed in this program. The willingness of successive Indonesian cabinets to yield in these matters to parliamentary moods and press opinions bordered on weakness; the more so because no elections had ever been held and the parliament consisted of groups of which none was sure of its measure of political support among the people. The growing realization that things were not yet going well in this respect caused the lingering political crisis to which the president alluded, and it looked as if only the general elections, to take place in 1953, could bring about the necessary change.

(W. G. P.)

Education.—Schools (1950): primary 23,700, pupils 4,174,031, teachers 72,891; secondary 1,250, pupils 165,399, teachers 7,500; Chinese 681, pupils 162,315, teachers 3,421. Teachers' training colleges 397, students 21,023. University education: faculties 14, students 3,238.

Finance and Banking.—Budget: (1950 est.) ordinary revenue 6,414,000,000 rupiah, ordinary expenditure 7,798,000,000 rupiah; (1951 est.) ordinary revenue 7,530,000,000 rupiah, ordinary expenditure 7,806,000,000 rupiah. Short-term national debt (Aug. 1952) 2,100,000,000 rupiah. Total national debt (Dec. 1950) 6,086,000,000 rupiah. Currency circulation (March 1952) 3,434,000,000 rupiah. Gold reserves (Aug. 1952) U.S. \$280,000,000. Bank deposits (March 1952) 1,948,000,000 rupiah. Monetary unit: rupiah with a basic selling exchange rate (Oct. 1952) of 10.64 rupiah to the pound sterling and 3.81 to the U.S. dollar.

Foreign Trade.—(1951) Imports 3,064,000,000 rupiah, exports 4,664,000,000 rupiah. Main sources of imports (1951): U.S. 20%; Japan 19%; the Netherlands 12%. Main destinations of exports: Malaya and Singapore 34%; the Netherlands 21%; U.S. 17%; U.K. 6%. Main imports: textiles 34%; rice 9%; machinery 13%; metals and manufactures 8%. Main exports: rubber 42%; petroleum and products 20%; copra 8%; tin 7%. Volume of exports, 1951 (1948=100): rubber 184; tin 95; copra 217.

Transport and Communications.—Main roads (1948): 2,400 mi. Licensed motor vehicles (Dec. 1950): cars 20,000; commercial vehicles 19,000. Railways (1950): 3,960 mi.; passengers 105,000,000; goods carried 5,316,000 metric tons. Shipping regularly serving Indonesia (1947): merchant vessels 154; gross tonnage 757,000. Air transport (1950): passenger-miles 92,000,000; cargo ton-miles 4,000,000. Telephones (1951): 43,000. Radio receiving sets (1951): 150,000.

Agriculture.—Main crops (metric tons, 1951, except as noted): rice, paddy (Java and Madura only) 5,470,000; maize (Java and Madura, 1950) 1,850,000; sweet potatoes (Java and Madura) 1,365,000; cassava (1950) 7,465,000; sugar, raw value (Java and Madura) 427,000; peanuts (1950) 416,000; palm kernels (exports, 1950) 32,400; soya beans 286,000; copra (exports) 303,000; palm oil (exports) 58,100; tobacco (Java and Madura, 1949) 10,000; tea (1950) 35,300; coffee (estates only, 1950) 10,000. Index of agricultural production, 1949 (1934-38=100): 83. Livestock (1950): sheep 2,334,000; cattle 3,618,000; pigs 1,254,000; horses 616,000; buffaloes 2,773,000; goats 7,474,000. Fisheries: total landings (1948) 472,000 metric tons; men employed 258,000; boats 25,000.

Industry.—Fuel and power (metric tons, 1951): coal 861,000; crude petroleum 7,440,000. Raw materials (metric tons, 1951): tin concentrates 31,200; natural rubber 817,000; bauxite (1950) 678,000.

Industrial Health. Small plant health, safety and medical programs attracted unusual attention during 1952. The U.S. department of labour amended and strengthened its manual of health and safety practices with which manufacturers must comply in carrying out the terms of federal contracts. A publication issued by the public health service described successful small plant health programs and was intended to encourage the adoption of similar activity elsewhere. In anticipation of increased demand, medical organizations refined existing methods of short-term training for service as part-time industrial physicians.

The president's Commission on Health Needs of the Nation cited industrial health as defective in certain important aspects, and in panel discussions called for corrective action. Deficiencies were noted in the administration of workmen's compensation, in safety and health legislation, in in-plant preventive medical programs, in the extent of coverage by existing medical care prepayment plans, and in research, and recommendations were made as to how these obstacles could be overcome. The Brookings institution issued a comprehensive report on health resources, sections of which were based on a survey recently completed by the National Association of Manufacturers. Compared with previous findings by this same organization, the record of improvement made by member establishments was regarded as a remarkable example of private initiative in the industrial health field.

Union health and welfare programs continued to develop among hotel, building-maintenance, teamster and laundry workers, following the example previously set by the garment workers and miners. The soft coal miners' health and welfare fund made plans for three memorial hospital associations in Kentucky, West Virginia and Virginia, to comprise ultimately a total capacity of 1,000 beds.

Home and community conditions such as shelter, nutrition, family life and recreation are factors of great importance to the health and well-being of wage earners. Diminution in the number and severity of accidents away from work received accelerated attention by health and safety organizations. Because of the importance of the homemaker to industrial production, utility companies, manufacturers of household appliances and medical authorities joined to consider methods of spreading authentic information to the public, to industry and to professional groups concerning work simplification and energy-saving devices for housewives with cardiac, tuberculous and other disabling diseases. Based on these discussions, it was thought that a jointly sponsored Health Home council could best carry out this type of activity.

The number of mines and mills engaged in the production and processing of uranium ore had doubled in the past several years. A detailed field study was made by several related federal and state governmental units in the western plateau region. Findings indicated that health control measures were essential, and steps were taken to convince operators respecting necessary protective installations and devices. Chromate manufacture was similarly studied because of reputed excessive occurrence of lung cancer in workers in this field, and in order to identify the responsible agent. The Seventh Saranac symposium on diseases of the lungs resulting from dust was held at Saranac lake, N.Y., under the auspices of the Trudeau foundation. Special interest centred about the identification of forms of pneumoconiosis attributable to nonsiliceous material. Calcined diatomaceous earth became the subject of much interest since convincing evidence showed that this agent is responsible for chronic disabling pulmonary fibrosis.

Ethylene diamine tetra acetate was regarded as a most promising advance in the treatment of lead poisoning. Further studies

were being made regarding the dosage and the exact nature of its depressive action on blood forming tissue.

Methods were devised for the satisfactory measurement of environmental noise. A method for the determination of the degree of impaired hearing was proposed which could be employed for medico-legal purposes. (C. M. Pn.)

Canada.—The industrial health division of the federal department of health and welfare conducted many studies during 1952, including researches into industrial dermatitis, lead poisoning and safety measures in the use of radioactive luminous compounds. It also waged an aggressive campaign for more complete and effective first-aid provisions in industry. The first civil defense industrial plant protection course was offered by the civil defense co-ordinator, in co-operation with the industrial health division. The Nova Scotia department of public health conducted an industrial hygiene survey of the printing industry in Halifax. The Quebec division of industrial hygiene issued a report that noted fewer cases of industrial diseases each year and the elimination of silicosis in granite-cutting. The Quebec division also continued its intensive investigation into working conditions within the province's 300 foundries. In Ontario, the Toronto general hospital's scheme of modernization and expansion envisaged a wing that would specialize in industrial medicine (a department of rehabilitation and physical medicine). The University of Manitoba organized an institute in industrial nursing to point up new developments and methods dealing directly with the practical problems of the nurse in industry; in Alberta the provincial health survey recommended creation of an industrial hygiene division. The Canadian dental association, to meet the requests of 843 industries, published *Industrial Dental Services*, giving in detail the information needed by any industry desiring to set up a dental program for its employees. (C. Cy.)

Great Britain.—In the 1950 annual report of the chief inspector of factories (Cmd. 8445, H.M.S.O., London, 1952) details were given of the incidence of industrial diseases reported during the year 1950. While in general the incidence of industrial diseases showed a steady decline, comment was made on the increase in the number of cases of epitheliomatous ulceration reported since 1920. In 1950 there were 195 cases, with 13 deaths, compared with 45 cases and only 1 death in 1920. The substances responsible were pitch, tar and oil, and the largest number of deaths was attributable to oil. Considerable research was being carried out into the carcinogenic properties of the various oils used in industry by the department of experimental pathology in the University of Birmingham.

The most serious, incapacitating and fatal of all industrial diseases was pneumoconiosis occurring among coal miners. In the past few years the number of deaths had been in the region of 1,000 a year. The history of lung diseases of coal miners in Great Britain, perhaps one of the most monumental of the medical histories of disease ever written, had been prepared by A. Meiklejohn (see *Brit. J. Indust. Med.*, 1951, 8, 127; 1952, 9, 93; 1952, 9, 208). It was published in three parts and brought into prominence the significance of the economic and social background of the industry, illustrating the awakening of the national conscience on behalf of those who were responsible for the nation's main primary product. Meiklejohn outlined in the third of these studies the important researches which were being carried out, both by the Medical Research council and the National Coal board.

Apart from those diseases which were prescribed under special regulations, there were, in 1952, 38 prescribed (compensatable) industrial diseases. The last of these to be prescribed as an industrial disease, and one of considerable significance, was tuberculosis in certain occupations involving close and frequent

contact with sources of tubercular infection (see *National Insurance [Industrial Injuries] [Prescribed Diseases]*, H.M.S.O., no. 305, London, 1951). This prescribing specially applied to persons engaged in medical treatment or nursing, to research workers engaged on research in connection with tuberculosis and to laboratory workers, pathologists and post-mortem workers handling tubercular material. While much progress had previously been made in the treatment of tuberculosis and its recognition as a social disease of great importance, this prescribing of the disease represented a step forward of considerable human and economic importance. (See also ACCIDENT PREVENTION; PUBLIC HEALTH ENGINEERING.) (A. J. Ar.)

Industrial Production: see BUSINESS REVIEW.

Infantile Paralysis. Data from the World Health organization, covering the first seven to nine months of 1952, indicated relatively high incidence of poliomyelitis in Belgium, Canada, Ceylon, the German Federal Republic and the Netherlands. In the United States 49,780 cases were reported from Jan. 1 through Oct. 25, with peak incidence during the week ending Sept. 20. The highest total recorded for any entire year previously was 42,033 in 1949, when the epidemic began to subside a month earlier.*

A field trial of gamma globulin as a prophylactic against poliomyelitis, begun in 1951, was completed. Subjects were 54,772 children, of whom half received gamma globulin intramuscularly in an average dosage of 0.14 ml. per pound body weight. The others received an inert, innocuous substitute and served as controls. Preliminary data, covering eight weeks or more from the time of injection, showed 90 cases of poliomyelitis in the entire group and demonstrated a protective action of gamma globulin. The effect on attack rate was most positive through the second to fifth week (6 cases in the gamma globulin group, 38 controls). The severity of the disease appeared to be reduced by gamma globulin in cases that developed during the first week. A final analysis was to be published early in 1953 after follow-up studies had been completed.

The gamma globulin used was prepared from large pools of adult human blood plasma. Donors to such pools always include some who have acquired immunity to poliomyelitis by natural exposure, and antibody in their plasma becomes concentrated in the gamma globulin fraction. In gamma globulin prepared from blood of single donors or small groups, antibody against any one or all three of the virus types might not be present.

This human trial showed that minimal levels of serum antibody, as detectable by the available tests, give significant protection against paralytic poliomyelitis in natural infection of man. Other experiments showed a similar protection by human gamma globulin against paralytic illness in *Cynomolgus* monkeys inoculated with the virus by mouth.

The first experimental inoculation of human subjects by mouth with live poliomyelitis virus was reported. Of 20 to whom the virus (type 2) was fed, 14 became intestinal carriers of virus for a few days or weeks (evidence of subclinical infection) and most developed serum antibody against the type of virus administered. Tests on eight subjects showed no antibody development against type 1, and tests against type 3 were not reported. The virus used had been propagated through numerous passages in cotton rats, leading apparently to a marked reduction of pathogenicity for monkeys. None of the inoculated human subjects suffered any illness in consequence. A reduced virulence of this strain of virus for man could hardly be inferred from this experience, however, since the ratio of inapparent to clinically recognizable type 2 infections, naturally acquired, is quite high.

Chimpanzees and *Cynomolgus* monkeys, infected by mouth with various strains of poliomyelitis virus, become intestinal carriers and develop serum antibody as did the human subjects in the experiment described. Clinical signs of poliomyelitis may or may not supervene. It was found that in these animals appearance of virus in the stool may be followed by a transitory appearance of it in the blood (viremia). In instances where paralytic illness developed, a period of viremia preceded paralysis. Disappearance of virus from the blood is followed immediately by appearance of serum antibody. Viremia preceding paralysis had not yet been demonstrated in man, and it was not clear whether viremia in animals is a prerequisite to paralytic disease or not.

Vaccination of six human subjects, with composite vaccine representing the three known types of virus, was reported. The virus was inactivated by treatment with formalin. Gamma globulin was administered before the vaccine, both as a measure of safety and to observe any interference of it with antibody response to the vaccine. The subjects developed a small though indefinite antibody response to type 2, a better response to type 3 and little or none to type 1. The vaccine was prepared from infected spinal cord tissue of monkeys. It was recognized that vaccines from this source would be unsuitable for general use because of possible allergic reactions. This risk should be avoided by using virus grown in living tissue cultures of non-nervous cells.

Application of tissue cultures to laboratory work with the poliomyelitis viruses continued. Use of such cultures expedited and simplified the identification of virus in suspected materials and determination of its immunologic type. Antigens for complement fixation tests had been prepared from the fluid of infected cultures. Use of a synthetic nutrient medium prolonged the life of infected cultures and markedly increased the total yield of virus.

One strain of poliomyelitis virus was successfully propagated in chick embryos. This was accomplished after a long series of passages in immature hamsters, more direct approaches by numerous investigators having failed. It was believed that this might facilitate laboratory work with the virus, and possibly the development of a live-virus vaccine. Only one of the three types of poliomyelitis virus had as yet been adapted to the embryonated egg. (See also EPIDEMICS AND PUBLIC HEALTH SERVICES; MEDICINE.)

SPECIAL BATHTUB used in hydrotherapy for polio victims being demonstrated to nurses of several nations who were at the Henri Poincaré hospital near Paris to study new treatment methods in 1952

births, just 1% under the rate for the same period of 1951. However, the 1952 infant mortality rate was below that for 1951 only in the first four months of the year, the next three months showing a setback. It was estimated that there were altogether 107,300 deaths under one year of age during the whole of 1951, with a rate of 28.8 per 1,000 live births. This was practically one-half of the rate for 1936, namely 57.1 per 1,000 live births and about one-third of the 1920 rate, which was 85.8 per 1,000. Provisional data covering urban places in England and Wales during the first eight months of 1952 showed an 11% reduction in the rate from the same period of 1951. For the whole of 1951, England and Wales recorded 20,103 deaths under one year of age, and an infant mortality rate of only 29.6 per 1,000 live births. This may be compared with an average annual rate of 50 per 1,000 in the period 1941-45 and 36 per 1,000 in 1946-50. The recent infant mortality rates per 1,000 live births for other English-speaking countries were: Europeans in New Zealand, 23 (1951); Australia, 24 (1950); Europeans in the Union of South Africa, 34 (1951); Northern Ireland, 39 (1950); Scotland, 39 (1950) and Canada 41 (1950).

The infant mortality rates per 1,000 live births for European countries with data for 1951 were: Sweden, 21; the Netherlands, 27; Finland, 35; France, 46; German Federal Republic, 53; Belgium, 58; Austria, 62; Italy, 67; and Spain, 68. In 1951 Jews in Israel had an infant mortality rate of 39 per 1,000.

Results based upon a 10% sample of the vital records for the United States in 1951 showed that deaths under 28 days of life occurred at a rate of 20.2 per 1,000 live births, while deaths from 28 days to 11 months were at a rate of only 8.6 per 1,000 live births. Deaths within the first year of life per 1,000 live births occurred at the following rates for the leading causes: immaturity, 6.7; congenital malformations, 3.8; postnatal asphyxia and atelectasis, 3.8; birth injuries, 3.2; influenza and pneumonia (except pneumonia of newborn), 2.3; gastritis, duodenitis, enteritis and colitis, 1.1; pneumonia of newborn, 0.8; diarrhoea of newborn, 0.1; and all other causes, 7.0. The only causes for which improvements were noted according to provi-

Infant Mortality. The infant mortality rate (deaths under one year of age per 1,000 live births) in the United States continued to move to a new low level in 1952, the rate for the first seven months being 28.9 per 1,000 live

sional records which covered the first six months of 1951 and 1952 were birth injuries and immaturity. Improvement was also recorded in the rate for deaths under 28 days of life, as well as for deaths in the rest of the first year of life.

Infant mortality rates per 1,000 live births according to race and sex for the United States in 1949, the latest year for which complete data were available, were: white males, 32.5; white females, 25.0; nonwhite males, 52.5; nonwhite females, 42.0. Compared with white infants, the nonwhites had a particularly high infant mortality rate from the infective and parasitic diseases, influenza and pneumonia, diseases of the digestive system, and accidents. Among all infant deaths, homicide accounted for about 0.1% for both the whites and the nonwhites. Deaths within the first 28 days of life per 1,000 live births for the leading causes were: immaturity—whites 6.3, nonwhites 9.6; postnatal asphyxia and atelectasis—whites 3.6, nonwhites 4.1; birth injuries—whites 3.4; nonwhites 3.5; congenital malformations—whites 2.8, nonwhites 1.6. For all causes, the rates within the first 28 days were: white males 23.3; white females 17.2; nonwhite males 32.1; nonwhite females 25.0. Of the total deaths within the first year of life, 10% occurred within the first hour of life, 33% within the first day, and 68% within the first 28 days.

Altogether, 81,489 foetal deaths (stillbirths) were reported in the United States during 1949. Of this total 70,584 were at a gestational age of 20 or more weeks, the rate being 19.8 per 1,000 live births. These figures were commonly regarded as gross understatements of the actual situation. A crude estimate was that there were about 500,000 foetal deaths of all gestational ages in the United States annually. The ratios per 1,000 live births for registered foetal deaths where gestation was 20 weeks or more were: whites, 17.5; nonwhites, 34.6. The foetal death ratios were under 15 per 1,000 in Connecticut, South Dakota, Utah and Oregon.

A study of deaths under one month of age, according to birth weight, in New York state for 1945-49 (exclusive of New York city), as reported in the *Statistical Bulletin* of the Metropolitan Life Insurance company for Feb. 1952 showed the following deaths per 1,000 live births: birth weight 1,000 g. or less, 951; 1,001 to 1,500 g., 656; 1,501 to 2,000 g., 238; 2,001 to 2,500 g., 59. Birth weights under 2,500 g. are considered premature. For babies weighing more than 2,500 g. the corresponding rate was only 9 per 1,000. (See also BIRTH STATISTICS; DEATH STATISTICS.) (M. Sp.)

Insurance. **Life Insurance.**—In early 1952, approximately 86,000,000 persons in the United States owned \$253,000,000,000 of life insurance in legal reserve companies, an increase of 8.1% in one year and more than 100% in ten years. This insurance was composed of \$160,000,000,000 ordinary, \$58,000,000,000 group and \$35,000,000,000 industrial. By the middle of 1952 the above total amount of life insurance had increased to \$265,000,000,000. In Canada, at the beginning of 1952, more than 5,000,000 policyholders owned about \$17,200,000,000 of life insurance, made up of \$12,500,000,000 ordinary, \$3,100,000,000 group and \$1,600,000,000 industrial.

In both the United States and Canada the premiums paid for life insurance in 1951 were equal to about 2.5% of the people's income.

Although the amount of legal reserve life insurance owned by policyholders in the United States and Canada was very large, the total was equal to only a little more than one year's personal income of the residents of these countries. Nevertheless, the United States and Canada ranked high above other countries in the ratio of life insurance in force to national income.

During 1951, legal reserve life insurance companies made benefit payments to United States families of almost \$4,000,000,000, which was nearly 60% more than in 1941. Beneficiaries received \$1,700,000,000 of this in the form of death benefits, while living policyholders received \$2,300,000,000 as matured endowments, annuity payments, surrender values, policy dividends and the like. Benefit payments to Canadian families in 1951 amounted to \$249,000,000, of which \$91,000,000 represented payments to beneficiaries and \$158,000,000 payments to living policyholders.

In the United States early in 1952, veterans and servicemen held more than \$50,000,000,000 of National Service and United States government life insurance and, in addition, each man in service had available a gratuitous indemnity of \$10,000 (inclusive of any National Service and United States government life insurance he may have) for death during active military service.

There was also more than \$10,000,000,000 of life insurance in force in fraternal societies, assessment associations, etc. The survivor benefits provided by the Social Security act afforded death benefits to certain members of the families of persons covered by the law and were the equivalent of a substantial amount of life insurance. Liberalizations in these benefits became effective in Sept. 1952.

Life insurance companies in the United States continued to make large investments in corporate securities, mainly industrial bonds and notes. In the first seven months of 1952, holdings of such securities increased by more than \$2,000,000,000. Mortgage holdings increased during this period by more than \$1,000,000,000, while United States government security holdings decreased by \$600,000,000. Stocks represented a small part of corporate security holdings and were mainly in the preferred category, even though life insurance companies were permitted to invest in common stocks in five out of every six states.

As of July 31, 1952, assets of United States and Canadian legal reserve life insurance companies reached \$76,000,000,000, made up of about 40% corporate securities, 30% mortgages, 15% government bonds and 15% other assets.

For 1951 the net interest rate earned on assets of United States companies was 2.98% after federal income taxes. This was virtually unchanged from 1950. (See also SOCIAL SECURITY.)

(L. A. L.)

Property Insurance.—Premiums and losses climbed to astronomical heights in 1951. Net earned premium income of some 746 major companies in the fire insurance industry totalled \$3,390,259,709. This figure was an approximate increase of 8% over the previous year. Losses and expenses kept pace with the premium increase so that the actual gain from the underwriting of fire insurance risks was \$16,561,156 in 1951, compared with \$196,075,919 for 1950.

The volume of fire insurance coverage continued to increase in 1952, but it was believed that net premiums might not be greater. This anomaly was explained by the growth in popularity of the instalment premium plan as opposed to the old single premium payment even for so-called term insurance (policies for more than one year). Profits were expected to be the same or slightly less in 1952 for fire insurance underwriting.

The extended coverage endorsement, which is attached to

many fire insurance policies and which broadens the coverage to include such risks as windstorm, hail, riot, explosion and smoke, produced heavy losses in 1951. A marked improvement was experienced in 1952 under this form. Two influences contributed to this result: Promulgation of higher rates because of the storm losses and a sharp upsurge in the purchase of this coverage, probably flowing from the storm experience.

During 1951 this important coverage was revised and broadened. This was the first important change since this endorsement first appeared in 1938.

Inland marine insurance continued to be a fast-growing segment of the property insurance field. It is an extension inland of the ocean marine coverages. It insures all types of property in transit or related to transportation. Premiums in this area of insurance protection were increasing and the loss experience was satisfactory. The largest line written was the personal property floater with about \$43,000,000 in premiums written in 1951. This coverage with appropriate schedules attached took the place of all insurance on household goods and personal property of an entire family, both within the home and while away from the home.

Casualty insurance premiums increased materially in 1951. There was an approximate 20% growth in earned casualty premiums over 1950. Premium volume was in excess of \$6,000,000,000. Despite the premium increase, loss ratios in accident and sickness, automobile and workmen's compensation insurance made 1951 a dark year in the history of casualty insurance. Substantial investment income, coupled with the enlarged premium income, helped the companies to survive the year without serious surplus impairment.

Rates in most of the casualty insurance lines were revised upward in the majority of states in 1951. But, at least in automobile insurance, further upward rate adjustments loomed on the horizon. Some over-all casualty loss ratios for 1951 were: accident and health, 69.4%; automobile, 67.7%; workmen's compensation, 77.9%; burglary, 44.2%; fidelity, 46.2%; surety, 35.3%; boiler and machinery, 30.3%.

Automobile insurance plagued the companies with severe losses in 1951. Premiums in this field amounted to \$2,882,924,000 in 1951. This was a gain over 1950 of \$364,126,745. The year 1952 with its rate increases and with additional financial responsibility statutes in two or three states portended a premium volume in excess of \$3,000,000,000.

Despite the heavy premium increase in 1951, losses and expenses in automobile insurance exceeded income by more than \$100,000,000. A slight improvement in the situation was noted in the first half of 1952. But the impact of inflation on claim costs, judgments, hospital and medical fees and repair costs, continued to exact a heavy toll on the automobile insurance field. The problem evoked considerable debate and discussion. Many solutions were offered. A few of the curative procedures mentioned were: a system of merit and demerit rating to reward the good driver and penalize the poor one; reduced agents' commissions; yearly revision of rates. Meanwhile, the state legislatures tightened the laws on financial security for the person injured by the negligent motorist. These laws had the net effect of increasing automobile insurance coverage at a time when the market for such insurance was contracting under the pressure of the adverse loss ratio.

Both general liability and workmen's compensation insurance proved troublesome in 1951. The upward rate revisions of 1951 began to reflect themselves, and it did not appear that 1952 would be profitable for these lines.

Accident and sickness insurance continued its speedy growth. Hospital expense coverage experienced a 12% increase in 1951 over 1950; surgical expense, a 20% increase; medical expense,

a 28% increase; cash sickness benefits, a 6% increase (oldest form of accident and sickness insurance). Loss ratios also increased, primarily in the group coverages where competition forced rates below the break-even point. This situation was in the process of revision.

The other casualty lines, such as burglary, glass, boiler and machinery, fidelity and surety produced moderate profits.

During 1951 a program was initiated to standardize the policies known as professional liability coverages. These forms protect against errors and omissions by doctors, dentists, druggists, hospitals, etc. A new druggist liability policy was issued in 1951.

The boiler and machinery policy was also revised and clarified in 1951.

The years 1951 and 1952 were years of turbulence, growth and development in the private property insurance industry.

(L. J. A.)

Hospital, Medical and Surgical.—Voluntary health insurance coverage continued to expand rapidly during 1952, and as more commercial carriers entered the field the problem of duplicate coverage made it increasingly difficult to estimate actual amounts of total coverage held by individuals. However, it appeared that by the end of the year about 90,000,000 persons would hold about 100,000,000 contracts providing some kind of hospital coverage. Nonprofit Blue Cross hospital service plan enrollment amounted to 44,000,000, while 4,000,000 held membership in independent industrial, co-operative or clinic programs; the balance were covered by commercial group and individual contracts.

After allowing for duplication, surgical coverage amounted to about 75,000,000, of whom 31,000,000 held membership in nonprofit Blue Shield or other medically sponsored programs, 3,000,000 in independent programs, and the balance held some type of commercial insurance protection. Medical insurance continued to lag behind, with about 32,000,000 members, 16,000,000 in Blue Shield or medically sponsored coverage, 3,000,000 in independent programs and the remainder covered commercially.

One development that seemed significant in this field was the tremendous interest aroused by scattered offerings of so-called "catastrophic coverage" contracts. With virtually no experience in this field, and few available statistics, nonprofit plans and commercial companies did enrol a number of groups for coverages ranging from specific disease insurance to comprehensive hospital-surgical-medical benefits superimposed on existing benefits and providing as much as \$10,000 added coverage per person. Such contracts normally required both a deductible and coinsurance factor. Toward the end of the year, some commercial insurance companies ceased to offer these policies while studying experience, but there was little doubt that the scope of protection afforded was tremendously popular with many large firms.

(A. G. S.)

Great Britain.—An analysis of British insurance companies' accounts published in 1952 showed further substantial income expansion. The combined fire and accident premium income of 24 representative British offices rose in 1951 by £44,884,000 to £366,115,000. The consolidated underwriting profit was £17,421,000, or 4.7% of the premiums, compared with £23,132,000, or 7.2% in 1950. Marine premiums were £48,493,000, an increase of £8,245,000 over the figure for 1950, and provided a trading surplus higher by £711,000 at £4,565,000. Marine funds at the end of 1951 totalled £69,218,000, an increase in the year of £5,784,000. The increased premium income was in part the result of inflationary pressure, but company chairmen reported much genuine business increase, particularly among overseas connections. The upward surge in premiums required corresponding increases in trading reserves and, with claims enhanced

by the depreciating value of money, a considerable strain was thrown upon the trading accounts.

Including group life and pension business, the total new ordinary life sums assured written in 1951 exceeded £700,000,000, compared with £600,000,000 in the preceding year. New sums assured under industrial life policies, as represented by eight leading industrial life offices, expanded by £15,632,000 to £187,836,000, the average sum assured per policy being £45.2 against £43.8 and £39.5 in the two preceding years. The total industrial premium income was £102,500,000, an increase in the year of £4,205,000, and industrial life funds advanced by £20,220,000 to £699,591,000.

There was a sustained demand during 1952 for life assurances subject to the provisions of the Married Women's Property acts, and for policies based on an income benefit for dependents. New group life and pension schemes were less evident than in 1951, but endowment assurances written for "executive and noncontrolling directors" were again sought. As a result of higher interest yields, many offices announced a reduction in nonparticipating rates.

Losses on the fire account were noticeably heavier than in 1951. In the United Kingdom a heavy toll was exacted in the cotton industry by costly fires in mills and warehouses. Underwriters were presented with the problem of unsold stock accumulation, and in places the values at risk exceeded the international market capacity. In many countries floods and landfalls caused important disasters, recoveries under insurance bearing little relation to the damage sustained. The insurance cost of bush fires and floods in New South Wales was placed at £1,900,000. Australia also suffered several severe fires in industrial and storage risks. Rioting, incendiarism and pillage threw claims stated at £3,000,000 onto the British market.

Increased premium rates for motor business in the United Kingdom became effective in the year, but were generally considered to be based on inadequate data. Following unfavourable underwriting results in 1951, efforts were directed toward the consolidation of existing business. Common law liability of employers proved heavier than expected in the premiums charged, and adjustments to higher levels were made for certain trades and occupations. Property owners and general third-party liability, personal liability cover, fidelity guarantees, personal accident protection and plate glass and burglary insurance remained in good demand and produced satisfactory results.

The British marine market accepted £6,160,000 out of a total insurance of £11,000,000 on the new U.S. liner "United States." Theft, pilferage, nondelivery of cargo and losses under goods in transit cover caused concern to underwriters, as did also the rising cost of hull repairs. Progress in aviation produced new insurance problems and increased demand for hull, cargo and liability cover. (See also CO-OPERATIVES; FIRES AND FIRE LOSSES; LAW; VETERANS ADMINISTRATION, U.S.) (P. Ss.)

Interior Decoration. The year 1952 saw contemporary design established as the style leader in the home furnishing field in the United States, and there was evidence of a strong trend toward correlation.

The architectural influence dominated the contemporary collections with its "floating" or "off-the-floor" effect, especially in case goods pieces such as chests of drawers, dressers, serving boards, etc. Significant, too, was the sculptured, uncluttered look which gave a clean-cut architectural feeling. In upholstered

pieces, the lighter, open look and the wide use of foam rubber upholstery gave the pieces a smooth, clean appearance.

Following the trend to informal, open-type architecture, there were more multiple-purpose pieces flexible enough to be used in various rooms. Outstanding among these were the room dividers, which included chests, bookcases and desk-chests. These, being finished on all sides, could be placed anywhere in the room to create areas for living-dining, recreation, study, etc.

Adding a great deal of decorative interest to the new designs was the combination of wood with such materials as black metal or wrought iron, woven cane and sisal, leather, glass and decorative tiles. Legs of metal in brass, chrome and black were noted on many of the upholstered pieces, while black was used extensively for the bases of dining, occasional and cocktail tables.

There was a return to the natural wood finishes, more mellow than the bleached finishes but not as dark as the stains generally used for traditional furniture. Dark woods such as cherry and walnut, sometimes combined with light woods, gained in popularity.

Although the 20th-Century designs led the home fashion field, French Provincial, Early American, 18th-Century English, Empire and Directoire were still in demand. Many of these styles were simplified by the omission of elaborate carvings and were made smaller to fit in with the trend toward smaller room dimensions, and drawers and storage compartments were added.

In upholstery and drapery fabrics, nylon made great inroads in the popular-priced brackets with nylon jacquard friezes much in demand by the commercial furniture manufacturers. In the upper price range, wool tweeds and metallics were popular, with imported linens in Modern and Provincial patterns highly favoured. New developments in sheer curtains appeared with many of the sheers made of Orlon, nylon, rayon, cotton and linen in interesting textured weaves and handsome printed motifs. Many of these fabrics were designed to provide some degree of privacy while allowing light to enter the room.

In colours, dark green, red-beige and gray led the moderate-priced lines, while persimmon, lime, toast, kelly green, pumpkin, gold and cinnamon were the leaders in the higher-priced lines. Raspberry, black and white continued to be in demand, particularly in tweeds and dramatic prints.

With a 30% to 35% decrease in the price of wool carpeting during the year, 1952 saw a shift from the cottons and synthetics to the all-wools or wools combined with synthetic fibres. The newest offerings were characterized by fresh, clear colours and simplicity of design which depended upon the weave or the combinations of fibres for decorative interest, rather than on the floral or geometric patterns of the past. Wool twists appeared in smart, decorative colours to harmonize with the colour trends in upholstery and drapery fabrics. These colours included avocado and moss greens, turquoise and aqua blues, plum, beige, gray and the earth tones.

Most important in the all-synthetic carpetings was the three-dimensional effect achieved by the shading of self-colours. Novelty textures, casual designs and tweedy designs were introduced for the first time in the all-rayon or synthetic-fibre floor coverings. For the first time in almost a decade, the consumer was offered floor coverings of quality that were style-right and price-right.

The year disclosed the gradual return to the use of wallpapers in place of painted walls. Hand-screened papers in small-scale abstract patterns (often correlated with matching drapery and upholstery fabrics) and scenic designs were brought down to the price level of the average homeowner. Modern techniques also improved the machine prints with the result that drawings and tones of colour retained their original sharpness. Many papers were improved with plastic finishes so that they were

washable and longer wearing.

Simultaneously with the trend back to wallpapers, paint manufacturers announced several improvements in interior paints. The most important characteristics of these new paints was the easy application by the layman with brush, roller or sprayer, and the ability of the painted surface to withstand repeated scrubbing. Lipstick, nail polish and grease stains were easily removed from these painted surfaces with soap and water.

Radical design changes appeared in the lamp lines during 1952. Bases of black metal or polished brass in low, slender, tripod variations were combined with shades of woven reed, natural-colour linen, perforated copper and brass. There was a noticeable trend toward pin-up lamps which could be raised or lowered by means of a counterweight pulley, and which extended from the wall by a telescoping stem. A revival of ceiling lighting was also noted in the growing popularity of simple, contemporary fixtures made of brass or copper and operated on a pulley.

Serving accessories reflected the trend to easy, casual entertaining with folding, individual snack tables, sectionalized serving plates, lazy-susan trays and tables and stainless-steel flatware.

The basic principles of contemporary house design were setting the standard for all the important furniture designs—open floor plans, low ceilings, combination rooms, easy-to-maintain areas, extensive use of glass walls; the relationship between indoor and outdoor areas; simplicity; beauty through use of natural materials rather than surface ornamentation. These were the factors which dictated the significant changes in furnishings, bringing about the so-called modern effect and influencing even the traditional lines. (See also FURNITURE INDUSTRY.)

(G. M. J.)

International Bank for Reconstruction and Development.

During 1952 the International Bank for Reconstruction and Development continued to bend its energies to the acceleration of economic development in its member countries. Loans totalling more than \$257,000,000 were made during the first ten months of 1952, compared with a total of about \$208,500,000 for the entire year 1951. By Oct. 15, 1952, bank lending had reached \$1,489,287,000, with a total of 72 loans in 27 countries. The bank also increased its activities in giving technical assistance to its members.

Lending Operations.—From Jan. 1, 1952, to Oct. 15, 1952, the bank made 14 loans totalling \$257,504,000 in 11 countries.

Mexico received a loan of \$29,700,000 for power development during the year. The loan was made to the Federal Electricity commission and Nacional Financiera. When the projects financed by this loan would be completed in 1955, bank funds would have made possible an increase of 700,000 kw. in Mexico's generating capacity or nearly doubled the capacity at the time of the bank's first power loan in 1949.

Two loans were made to Peru: \$2,500,000 to provide modern facilities at the port of Callao for the handling of general cargo and for the unloading and storage of bulk grain, and \$1,300,000 to import agricultural equipment. More efficient handling of cargo moving through Callao, Peru's main port, was expected to reduce the turn-around time of ships, eliminate losses of grain from spillage and effect savings of foreign exchange. The bank-financed agricultural equipment was intended to improve methods of agricultural production, reclaim old and open new lands to cultivation.

A loan of \$28,000,000 was made to Southern Rhodesia to aid in carrying out the government's four-year program for economic development. The loan would help finance imported equipment and materials needed for power expansion. The ex-

ASSORTED OBJECTS featuring the wrought black metal popular in 1952, including lamp, chair, candleholders, long work table and slanting buffet server with four graduated glass shelves

pansion consisted of the installation of about 230,000 kw. of new thermal generating capacity, the erection of about 2,000 mi. of transmission lines and the installation of distributing equipment.

A loan of \$7,000,000 was made to Royal Dutch Airlines (K.L.M.) to help finance a program to replace part of its air fleet. The Chase National Bank of the City of New York was participating in the loan to the extent of \$3,500,000. The loan would finance about 20% of the total cost of K.L.M.'s replacement program for 1952-53.

Two loans to Pakistan were made during the year: \$27,200,000 for railway rehabilitation and \$3,250,000 for agricultural machinery. The railway loan would help finance a program for the rehabilitation, improvement and modernization of the government-owned railways in both east and west Pakistan. The agricultural loan would be used to help reclaim 660,000 ac. of the Thal desert in west Pakistan.

A loan of \$20,000,000 was made to the Bank of Finland for the further development of the wood-products industries, for the expansion of electric power facilities and for agricultural improvement. The loan would help the wood-products industries buy modern equipment to increase their capacity for making the more highly processed products; it would provide equipment for four hydroelectric plants and one steam-generating plant, increasing Finland's existing capacity by nearly a third by 1957; and it would pay for imported equipment to be used for clearing land and building forest roads.

A loan of \$25,200,000 was made to Turkey to pay the foreign exchange costs of a multipurpose dam on the Seyhan river, a power-generating plant, and power transmission lines to industrial centres. The dam would help control floods and provide water for irrigation and electric power in the Adana plain, a productive agricultural and industrial area. Increased power would make possible the growth of existing industries, the establishment of new ones and additional public use of electricity.

Loans totalling \$37,500,000 were made in Brazil: \$25,000,000 to help finance an electrification program being undertaken

in the state of Rio Grande do Sul to relieve critical power shortages and to provide power for future industrial development, and \$12,500,000 to buy rolling stock and equipment and rehabilitate track on the Central do Brasil railroad. The Central is Brazil's largest railway and serves the most highly industrialized centres.

A loan of \$50,000,000 was made to help Australia finance development in the following fields: agriculture and land settlement, coal mining, iron and steel production, electric power, railways, road transport, the production of nonferrous metals and industrial minerals, and manufacturing industries. Commonwealth and state authorities, business enterprises and individual farmers would benefit from the loan.

Colombia received a loan of \$25,000,000 to help build a railroad in the Magdalena river valley and to build and equip railroad repair shops in Bogotá. The new line would connect the country's eastern and western rail networks, linking the Pacific coast to the interior and providing a dependable rail-river route to Caribbean ports. The projects were part of an extensive program for railroad improvement.

Iceland received a loan equivalent to \$854,000 to help build a nitrogen fertilizer plant. The plant would save foreign exchange, as Iceland had to import all its fertilizer. This, like two previous loans to Iceland, was to be entirely in European currencies.

Other Activities.—In the course of its loan operations, the bank advises on a wide range of technical, financial and administrative matters related to the projects it finances. At the request of member governments, it also organizes groups of experts to visit member countries to assess their total economic resources and to make recommendations for development programs. In 1952 the reports of three missions of this type, to Iraq, Ceylon and Surinam, were completed and presented to the governments concerned. The report of a mission which visited Jamaica in 1952 was in preparation. A variation of the survey mission technique was used in Nicaragua. Instead of sending a large group for a few months, the bank sent one of its economists and an engineer for a ten-month period to help the Nicaraguan government draw up a development program. Experts were called in, as needed, for shorter periods. Before the report was presented in Sept. 1952, the Nicaraguan government had already taken action along lines recommended by the mission. A number of specialized missions to study specific development problems were sent to various member countries during the year. The report of a joint bank-F.A.O. (Food and Agriculture organization) agricultural mission to Chile was to be presented to the government in Nov. 1952.

Four countries—Burma, the Federal Republic of Germany, Japan and Jordan—joined the bank during the year, bringing total membership to 54 and increasing the capital subscription to \$9,036,500,000. The bank increased its funds for loans by the sale of two bond issues totalling \$110,000,000 in the United States, and one issue of (Canadian) \$15,000,000 in Canada. The bank's direct obligations outstanding on Oct. 15, 1952, totalled the equivalent of \$555,902,798. Sales from the bank's loan portfolio had increased to \$61,228,135 by Oct. 15. Net earnings for the fiscal year ended June 30, 1952, amounted to \$15,872,883, all of which was credited to a general reserve. In addition the bank added \$7,558,906 to its special reserve. Total reserves at the end of June aggregated \$85,712,754.

In March 1951 the United States International Development Advisory board, a representative group of private citizens appointed by the president of the United States in accordance with the Act for International Development, published a report entitled *Partners in Progress*. This report, prepared after consultation with the management of the bank, proposed, among

other things, that an international finance corporation be created as an affiliate of the bank, to help finance private enterprise by equity investment or by loans made without governmental guarantee. A report was prepared by the staff as a basis for continuing to explore the proposal with member governments and interested business groups. In June 1952, after discussing the report, the United Nations Economic and Social Council approved a resolution requesting that explorations continue, and that the bank inform the council in 1953 of the results of its study and of any action it might take on the proposal. International Labour Organization. The 35th session of the International Labour conference, held June 4–28, 1952, at Geneva, Switz., was attended by 654 delegates and advisers from 60 member states—the largest attendance in its history—and official observers from the United Nations, the World Health organization and many other groups. Libya was admitted to membership as the 66th member. Six international agreements were added to the world labour code: three conventions concerning (1) minimum standards of social security, (2) holidays with pay for agricultural workers and (3) a revised maternity convention, adopted originally in 1919; and three recommendations to supplement the conventions on maternity protection and holidays with pay, and to promote consultation between employers and workers at the level of the undertaking, in industrial disputes. The report of the director-general dealt chiefly with international technical assistance—the operational work of the I.L.O. Fifteen out of 25 sessions of the conference were devoted largely to the discussion of this report, with the result that much helpful criticism was received and practically unanimous support of the program assured. A total of 103 conventions and 95 recommendations had been adopted by the conference.

At the fifth conference of American States Members of the I.L.O., held April 17–29 at Petropolis, Braz., 14 countries were represented and 3 others sent observers. The director-general's report dealt chiefly with the incidence of inflation, trade unionism and freedom of association in Latin America. Land reform and the welfare of rural workers were the main subjects discussed.

The fourth Inter-American Conference on Social Security, held at Mexico City, Mex., March 24–April 8, 1952, was a larger body with 126 delegates from 22 American countries. Representatives from the United Nations, Food and Agriculture organization, World Health organization, the Organization of American States and the International Social Security association, as well as observers from France and Spain, attended the conference. The agenda included the report of the director-general, the extension of social security to agricultural workers, general family benefits, medical and pharmaceutical problems of social security, and a preliminary discussion of social security terminology. At the fifth session of the Permanent Inter-American committee, Caracas, Venez., was selected for the next conference.

At the 17th meeting of the Joint Maritime commission, Ge-

neva, Switz., May 13-15, it was voted to recommend that the governing body call a regional maritime conference in Asia early in 1953, with an agenda providing for a director-general's report and the discussion of methods of recruitment of Asian seafarers and the welfare of the same in Asian ports. The agenda also would provide for taking necessary steps to increase the number of regular members of the commission from 12 to 15 to make room for important maritime countries that had become I.L.O. members since 1946, when the last election of members was held.

The operational activities in connection with manpower, migration, underdeveloped areas and technical assistance had become so important as to threaten the earlier emphasis on the international labour code and labour legislation, but the temper of the conference showed clearly that this was not the case. The budget voted by the conference for 1953 was \$6,469,085, or about \$1,550 less than that voted for 1952, and the assessments voted were: U.S. 25%, U.K. 12.79%, France 7.49%, Germany 4.87%, India 4.13%, Canada 3.98% and all other members less than 4%.

Ratification of conventions totalled 1,315 in September. Reports of action taken, required for both conventions and recommendations, reached a higher level than usual, though many governments seemed negligent in their obligation to bring them to the attention of the constitutional authority within the prescribed time. (See also CHILD WELFARE.)

International Law. **The Rights of States.**—The deadlock on admitting new members to the United Nations continued during 1952. The United States especially urged the admission of Japan and Italy. In addition 19 states (Austria, Ireland, Portugal, Finland, Jordan, Libya, Ceylon, Nepal, Republic of Korea, Vietnam, Cambodia and Laos, supported by the democratic states, and Albania, Bulgaria, Hungary, Rumania, Mongolian People's Republic, Korean People's Republic, and Viet Minh, supported by the Soviet states) had applied for membership. The Soviet government proposed bloc admission of 14 of these states not including Japan. The United States took the position that states should be admitted individually each on its own merits. The Federal Republic of Germany, generally recognized by the western states, had not applied for admission but had been admitted to some of the specialized agencies. Spain had not applied for admission to the United Nations but had applied for admission to U.N.E.S.C.O. Switzerland, insistent on retaining its neutral status, had not applied for admission to the United Nations, but had become a party to the World Court statute. The issue of what government should represent China in the United Nations continued controversial. The national government, controlling Formosa, continued to be recognized, but the Soviet states continued to demand that it be replaced by the Communist government controlling the remainder of China.

There was a tendency for states to claim certain rights seaward from the coast beyond the traditional three-mile limit. On the basis of the sector theory, accepted by Canada but not by the United States, the Soviet Union claimed title to all land north of its territory. Soviet jurists also argued for title to the sea and the ice floes in this sector on the grounds that navigation was possible only when assisted by shore services, that the Soviet Union maintained navigation in the area as an internal route, that much of the sea was included in gulfs between Soviet territory, and that some of it, particularly the Kara sea, had

been claimed since the 16th century with general acquiescence. (S. A. Vysanepolsky, *Current Digest of Soviet Press*, Oct. 18, 1952, p. 3 ff.) The Soviet Union also claimed a maritime belt 12 mi. wide on its Baltic coast, but this claim was protested by Sweden.

Juristic discussion tended to support the right of a state to the sea bed as far out from its coast as resources can be exploited, but with insistence that this does not imply claims to fishery or navigation control (Lauterpacht, *British Yearbook of International Law*, 1950, p. 376 ff.). The United States claim of this type, asserted in 1945, had been generally acquiesced in by other sovereign states many of whom had made similar claims for themselves. It had resulted, however, in a controversy between the federal government and the states of the union as to the title of oil and other resources of the sea bed within this extended area. In a case involving California, the supreme court supported the claims of the federal government because of its exclusive international responsibility. Earlier decisions recognizing state title to the bed of internal waters were not, therefore, applicable. "The state is not equipped in our constitutional system with the powers or the facilities for exercising the responsibilities which would be concomitant with the dominion which it seeks. . . . Consequently we are not persuaded to transplant the Pollard (3 How 212) rule of ownership as an incident of state sovereignty in relation to internal waters out into the soil beneath the ocean, so much more a matter of national concern" (*U.S. v. California*, 332 U.S. 19, 1947). The same rule was subsequently applied in cases involving Texas (339 U.S. 707, 1950), and Louisiana (339 U.S. 699, 1950). The states sought to have these decisions reversed by congress and the issue was debated extensively in the presidential campaign of 1952.

A number of cases dealt with privileges and immunities of states and their agents. The Soviet Union, and the United States in retaliation, restricted movements of diplomatic officials of the other in their respective territories. A United States senate resolution called for the registration of foreign diplomatic and consular officers in the United States under the foreign agents registration act. China was permitted by a United States federal court to sue certain Chinese officials alleged to have defaulted with Chinese funds. The court held that the Formosan government, recognized by the United States as the government of China, was capable of representing China and that the matter was within the court's jurisdiction even though it concerned Chinese internal relations. (*Republic of China v. Pang-Tsu Mow et al.*, 101 Fed. Supp. 646, 1951.)

Rights of International Organizations.—The juristic status of international organizations had been generally acknowledged by both jurists and courts, and their privileges and immunities had been defined by numerous treaties, as well as by analogy to the privileges and immunities of states and diplomatic officers (Hans Aufricht, *Proceedings American Society of International Law*, 1952, p. 85 ff.). The secretary-general of the United Nations dismissed certain United States citizens from the secretariat who had refused to testify before a United States senate committee as to whether they were Communists. Other members of the secretariat were suspended. The secretary-general thus refused to recognize the immunity of secretariat members in respect to proceedings before official agencies of their own country on matters outside their official functions in the United Nations.

The United Nations and the specialized agencies had manifested their jural personality by concluding more than 300 agreements with states. Many of these agencies had been accepted as jural persons before the courts of member states. In a recent case the International Relief organization was permitted to

sue in a United States court (*I.R.O. v. Republic S.S. Corporation*, 189 Fed. [2nd] 858, 1951).

The role of law in the proceedings of the United Nations continued to be debated. A resolution introduced by Great Britain in the general assembly called for greater attention to international law in the drafting of requests for advisory opinions. The International Court of Justice dealt with an unusual number of cases during the year in one of which, that dealing with Morocco, the United States participated for the first time as a party in a litigated case. The court on Aug. 27, 1952, sustained the United States claim to equality of commercial treatment and limited consular jurisdiction in Morocco. The International Law commission in its report to the general assembly in Oct. 1952, presented a draft code of arbitral procedure and indicated progress in the codification of the law of nationality and statelessness, of the regimes of the territorial sea and the high seas, and of treaties.

Rights of Individuals.—Juristic writing manifested a tendency to acknowledge that individuals are subjects of international law (George Manner, *American Journal of International Law*, July 1952, p. 428 ff.; Willard B. Cowles, *Proceedings American Society of International Law 1952*, p. 71). The important issue, as suggested by U.S. Secretary of State Dean Acheson, concerns less legal principle than practical measures for affording protection. Debate on the proposed Covenant of Human Rights and the proposed Convention on Freedom of Information continued in United Nations organs but marked little progress. Some attention was given to the right of peoples and nations to self-determination in connection with the Covenant of Human Rights, with the regime of nonself-governing territories, and with the request for a hearing in the general assembly by Tunis and Morocco sponsored by a number of Arab and Asiatic states.

The supreme court of California sustained the opinion of the court of appeals nullifying the California Alien Land law which discriminated against land ownership by Japanese. It did so, however, on the ground that the law denied "equal protection of the laws" required by the 14th amendment of the United States constitution, and explicitly overruled the opinion of the court of appeals that it violated the pledge of the United States in the United Nations charter to respect human rights. The court said that the self-executing character of a treaty provision depended upon the intention of the parties and found, "although the member nations obligated themselves to co-operate with the international organization in promoting respect for, and observance of, human rights, it is plain that it was contemplated that future legislative action by the several nations would be required to accomplish the declared objectives, and there is nothing to indicate that these provisions were intended to become rules of law for the courts of this country upon the ratification of the Charter." (*Sei Fujii v. California*, 242 Pac. [2nd] 617, 1952.)

Major issues of individual rights were raised in the Anglo-Iranian Oil company dispute and in the Korean truce negotiations. In the former the International Court of Justice held on July 22, 1952, that it lacked jurisdiction because the United Kingdom was not a party to the agreement of 1933 between the Anglo-Iranian Oil company and Iran so this agreement was not a treaty, and Iran's acceptance of the court's compulsory jurisdiction in 1932 was limited to treaties subsequent to that acceptance so the relevance of earlier treaties could not be considered. The president of the court, Sir Arnold McNair of British nationality, concurred in the decision. Judges of United States, Canadian, French, Brazilian and Chilean nationality dissented. While the case was pending in the court, Great Britain requested the Security council to take measures to com-

pel Iran to observe the interim order which the court had earlier given. The Security council, however, postponed action pending the court's decision on the merits. This decision resulted in terminating the interim order. The debate in the Security council indicated that its standard for determining whether the issue was domestic, might differ from the standard applicable by the court because the Security council had competence over any dispute which threatened international peace and security. The Anglo-Iranian dispute precipitated much juristic discussion of the rights of private concessionaires in foreign territory. It was pointed out that new concepts of nationalization of private enterprise had considerably reduced the effectiveness of the protection which international law formerly gave to private rights of this type. (J. Frankel, *Year Book of World Affairs*, London Institute, 1952, p. 56 ff.; G. Schwarzenberger, *Current Legal Problems*, 1952, p. 295 ff.)

The Korean truce negotiations had been halted during the year because of the insistence by the North Koreans and Chinese that all prisoners of war in the hands of United Nations forces must be repatriated. This demand rested in part on article 118 of the Geneva convention of 1949 concerning prisoners of war which declares "prisoners of war shall be repatriated without delay after the cessation of hostility." Article 7 of this convention states "prisoners of war may in no circumstances renounce in part or in entirety the rights secured to them by the present Convention." The United Nations negotiators considered that the right secured to the prisoners is an individual right to be repatriated if they desire and not a right of their government to demand their repatriation. Since the prisoners in question deserted, as a result in some cases of inducement by the United Nations, it would be a gross breach of faith to return them by force to probable execution by the Communist authorities.

International Crimes.—No progress was made on the proposed International Criminal court and the text as drafted was widely criticized by jurists. Nor had progress been made on the definition of international crimes by the International Law commission. Justice Robert H. Jackson expressed the opinion at the annual meeting of the American Society of International Law, that codification of international criminal law might be premature. The jurisprudence of the actual trials of war criminals, he thought, provided a basis for important juristic developments in this field. (*Proceedings*, 1952, p. 196 ff.)

Opinion in Germany and Japan had demanded clemency for convicted war criminals. The issue was raised in connection with the Japanese peace treaty by which Japan accepted the convictions by Allied courts and agreed that clemency in any case must depend upon consent of the government or governments which imposed the sentence. In the case of persons sentenced by the international military tribunal, consent by a majority of the governments represented on the tribunal was required (article 11). Before the treaty went into effect Gen. Douglas MacArthur had paroled 300 Japanese war criminals who had completed more than one-third of their sentence. On April 15 it was announced that the Japanese government had cleared the name of Gen. Masaharu Homma, the former commander of the Philippines, executed in 1946 for responsibility for atrocities, including the Bataan "death march." On April 28 when the peace treaty went into effect, the Japanese government granted amnesty, including pardons, reduction of sentences, and restoration of civil rights, to 1,300,000 persons, none of them, however, war criminals convicted by Allied courts. On July 29, it asked the Allies to consent to clemency for 230 war criminals serving sentence, but eligible to clemency on the basis of a Japanese law identical with that established on the subject by General MacArthur. The United States set up a board of clem-

ency and parole for war criminals on Sept. 4 to consider these requests.

On Sept. 17, German Chancellor Adenauer appealed to world public opinion for aid in the solution of the problem of war criminals and prisoners of war. There were 1,017 Germans still in the custody of the western countries though 75% of those condemned by Allied courts had been released. The number of prisoners of war and war criminals still in the U.S.S.R. was unknown but was certainly more than 100,000. On Oct. 8, Gen. Vassily Chuikov of the Soviet Union and the three western commissioners agreed to relax the conditions of war criminals in Spandau prison.

Treaties.—Discussion continued on the different opinions expressed by the International Court of Justice and the International Law commission concerning the effect of reservations to multilateral treaties, and some constructive suggestions were made. (See W. W. Cox, *Proceedings American Society of International Law*, 1952, p. 26 ff.) The situation left the secretariat of the United Nations in a quandary as to who were the parties to some such treaties and when they came into force. The inconclusive action of the general assembly, "leaving to the appreciation of each of the states which may be concerned the legal consequences of reservations to future conventions" was, in the opinion of Manly O. Hudson, "far from an encouragement to orderliness in the process of international legislation" (*Proceedings American Society of International Law*, p. 15). The international law commission was to study the matter further in its effort to codify the law of treaties. The process of international legislation continued, mainly through the agency of the United Nations and the specialized agency. About 20 general treaties had been negotiated under United Nations auspices.

During the year there was much discussion in the United States, both juristic and popular, on the proposal to amend the United States constitution in order to restrict the treaty-making power. A proposal by Sen. John W. Bricker of Ohio, supported by more than 50 senators, sought to reduce the use of executive agreements and to eliminate the self-executing character of treaties. A proposal by the American Bar association would have gone further by making it impossible for a treaty to become effective as internal law if its provisions went beyond the congressional powers of domestic legislation. International lawyers were generally adverse to these proposals which they thought would severely impair the United States' capacity to protect its citizens abroad and to increase the general protection of human rights by international legislation, and would jeopardize the good faith of the United States in numerous instances by subjecting treaties to impairment by inaction or inaction of any of the states of the union. The proposed restrictions on the making of executive agreements would, in the opinion of the defense department, render co-operation with other governments in North Atlantic or other international defense activities practically impossible, and would also impair programs of technical assistance, international exchange of persons and reciprocal commercial agreements. This movement arose from opposition to executive political commitments such as those of the Yalta conference and to limitations on states rights and American domestic jurisdiction which might be consequent upon ratification of treaties like those on genocide and human rights. Most jurists felt that the fears expressed in this agitation were exaggerated.

War and Aggression.—The Korean operations of the United Nations continued during the year. The armistice negotiation became stalemated on the issue of compulsory repatriation of war prisoners. The subject was discussed in the United States election campaign and in the general assembly meeting in the

autumn of 1952.

A number of cases concerning individual rights in time of war were dealt with by national courts during the year. A United States court held that a person of dual United States and Japanese nationality retained his United States allegiance while in Japan during the war and was guilty of treason when he engaged in brutal treatment of United States prisoners of war (*Tomoya Kawakita v. United States* 190 Fed. [2nd] 506, 1951). A United States court held that a United States citizen did not have good title to property originally owned by Dutch citizens, confiscated by the nazis during their occupation of the Netherlands and acquired by the United States citizen after several transfers. The Netherlands also failed to acquire title on the basis of a decree of the government-in-exile during the occupation. The court questioned whether German rights as a military occupant were nullified by the aggressive character of the nazi occupation. (*State of Netherlands v. Federal Reserve Bank of New York*, 99 Fed. Supp. 655, 1951.)

A British prize court held that vessels in process of construction in a dry dock in a German port occupied by British forces before the surrender of Germany in 1945 but not formally captured until 1947 were good prize subject to condemnation as enemy property. It held that these hulls were not property on land and were captured during hostilities. (*The Hermes*, 1 Lloyd's Prize Cases, [2nd] 289, 1951.)

It cannot be said that international law advanced during the year, in either precision of content or regularity of observance. Great differences of ideology, great changes in the distribution of power, great inconsistency between the material conditions of a shrinking world and the human beliefs evolved from national cultures, and great uncertainty of the future inherent in a rapidly changing world, had shattered traditional standards and hampered the development of a consensus about principles or practices which might combine stability with progress toward the realization of human aspirations. Yet it was hoped that the intense, and on the whole disinterested, thought given to the problem by international and national political and juridical agencies, by national and international associations, and by individual jurists and scientists might in time develop an international law adapted to the new situation of the world. (See also UNITED NATIONS.) (Q. W.)

International Monetary Fund. During 1952 the International Monetary fund continued its activities in the field of international consultation and co-operation on the various monetary and exchange problems of its member countries. The fund continued to emphasize to its members the importance of reducing or removing existing restrictions and pressed for the simplification of multiple currency practices. During the period under review, increasing attention was given to the adoption of policies which could make more effective the use of the fund's resources. The fund continued to extend technical assistance to member countries on a variety of specialized problems. It also continued its collection and interpretation of balance of payments and other statistical data and carried forward its general and specialized training programs for officials of member governments. The fund co-operated actively with other international and regional organizations.

During 1952 membership of the fund was increased to 54 by the admission of Burma on Jan. 3, Japan on Aug. 13, Germany on Aug. 14 and the kingdom of Jordan on Aug. 29. The aggregate of fund quotas was thus increased to \$8,736,500,000. Major asset items consisted of approximately \$1,680,800,000 in gold, \$5,692,300,000 in members' currencies and \$1,356,200,000 in capital receivable from members whose par values had not yet been

established. Indonesia and Haiti were admitted to membership in the fund at the seventh annual meeting (Sept. 1952) with formalities to be completed later.

The establishment with the fund of an initial par value for the Ceylonese rupee was effected Jan. 16, 1952. As of Sept. 30, 1952, the par values expressed in gold and U.S. dollars had been established for the currencies of 41 of the fund's members. The executive board agreed to a change in the par value of the Yugoslav dinar (effective Jan. 1, 1952). This change not only represented a drastic devaluation but also signified a far-reaching reform of the economic system of Yugoslavia. During 1952 the fund also consulted with several members on changes in their foreign exchange systems, which did not involve changes in their agreed par values.

In 1952 the fund entered a new period of activity in the field of restrictions. Its articles of agreement provided that five years after the date on which the fund began operations—and each year thereafter—member countries still maintaining restrictions inconsistent with the fund's articles should consult with the fund on the underlying factors affecting the further retention of such restrictions. The majority of the fund's members still maintained the restrictive measures permitted during the post-war transitional period, although they varied widely in form and intensity. The consultations, beginning in March 1952 and continuing late in the year, afforded an opportunity for discussion with member countries of possible measures by which restrictions might be eliminated or modified. The procedure being followed in these consultations was set forth in the *Third Annual Report on Exchange Restrictions* published by the fund in May 1952.

During the period under review, the fund board carried on extended discussions with respect to the appropriate use of its resources. Measures were adopted which were designed to safeguard the revolving character of its resources and at the same time facilitate their use by members willing to pursue financial and payments policies and practices that would enable them to make more rapid and significant progress toward the establishment of the stable system of nondiscriminatory multilateral trade, which is one of the fund's objectives. The principle underlying a decision of the executive board on Feb. 13, 1952 (published in the *Annual Report*) was that exchange purchased from the fund should not remain outstanding beyond a period reasonably related to the payments problem in respect of which it had been purchased from the fund. This period would fall within an outside range of three to five years. A further decision relating to the use of the fund's resources was taken on June 19, 1952, in response to the first request received from a member (Belgium) for a stand-by arrangement rather than an actual drawing, and in Oct. 1952, general principles and procedures relating to stand-by arrangements were agreed on.

Between March 1, 1947, when the fund commenced operations, and Sept. 30, 1952, 21 member countries had obtained short-term financial assistance by purchasing foreign exchange from the fund with corresponding amounts of their own currencies. During 1952 purchases by Brazil of \$37,500,000, by Paraguay of \$875,000, by Turkey of \$10,000,000 and by Australia of \$30,000,000 brought these transactions to a total of \$892,408,380 (as of Sept. 30, 1952). The fund also made a stand-by arrangement which would permit the government of Belgium to purchase on a revolving basis up to \$50,000,000 in currencies held by the fund. The following countries repurchased amounts of their own currencies from the fund during 1952 with payments of gold or dollars or both: the Netherlands, \$27,351,500.02; Brazil, \$65,500,000; Chile, \$3,679,308.28; Peru, \$3,097,298.72; Syria, \$418,000; and Turkey, \$4,997,729.07. With these payments, repurchases totalled \$184,693,538.87.

In 1952 the fund continued to maintain active and close relations with its members in the general field of technical assistance. On March 21 the fund informed its members that it was prepared to provide them with a regular technical service in connection with their gold transactions. Fund representatives visited 37 countries to consider problems relating to their national economies and financial systems. Through such consultations the fund was able to obtain a clearer understanding of the situation in each country and to assist in the formulation of practical programs of action.

The fund's board of governors held its seventh annual meeting in Mexico City, Sept. 3–12, 1952. At that time the executive board presented its *Annual Report* on the fund's activities. In reviewing the world economic situation, the report stated that during the seven years since World War II and more than five years since the fund began operations, exchange restrictions of many types had continued in existence and international payments were still far from having attained a state of balance. It re-emphasized the close and inseparable connection between internal fiscal, monetary and economic policies and external equilibrium and balance in international payments. It noted that recent measures taken by the fund to facilitate the utilization of its resources were important steps toward making the fund a more effective instrument in assisting members to meet temporary imbalance in their international accounts and to pursue sound exchange policies, but remedial action must be taken by members to eliminate balance-of-payments deficits which might be the result of unsatisfactory domestic fiscal and monetary policies. It also expressed the earnest conviction that all countries in a strong balance-of-payments position should take all practicable means of reducing barriers to international trade as their most effective contribution to the restoration of a balanced world economy. (See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; TRUST TERRITORIES.)

International Trade. World exports in 1952 were tending to decline from the record levels of a year earlier. The boom in trade, caused by the war in Korea and the subsequent programs for rebuilding defense strength in the free countries of the world, was tapering off. At an annual rate, exports for the first quarter were approximately \$77,000,000,000 compared with about the same level for the year 1951. After allowing for price changes, however, the volume of trade in the first half year probably declined by at least 5% from the high levels of 1951.

In 1952 there was again an improvement in the balance of payments of the world with the United States, after a serious deterioration in 1951. This change was made possible in part by a resumption of heavy purchasing abroad by United States traders following the sudden and sharp slump in the middle of 1951, but even more importantly by declines in purchases from the United States by the rest of the world. When large deficits with the dollar area reappeared, particularly for European countries late in 1951, a number of those countries tightened their exchange and import restrictions. There was an inevitable time lag before these restrictions came into effect, but by the third quarter of 1952 it was evident that reductions in imports from the United States were sizable. This reduction in United States exports and increase of imports operated by the third quarter to reduce the U.S. export surplus, exclusive of military-aid shipments, to considerably less than \$1,500,000,000 at an annual rate, compared with \$3,500,000,000 in the second quarter.

INTERNATIONAL ECONOMIC conference which opened in Moscow in April 1952, with the U.S. represented by 13 people, including businessmen and trade unionists. Delegates listened to the speeches through headphones

After the declines in raw-material prices in early 1952, many countries in the far east and some in Latin America imposed or tightened restrictions against United States goods. Some countries in all parts of the world had increased their purchases so rapidly in 1951 that they were in serious over-all balance-of-payments difficulties and felt compelled to extend controls over all imports, whether paid for in dollars, sterling or other currencies. Restrictions were also continued and, in some cases, extended against trade with the soviet bloc countries, particularly China. The first half of 1952 saw further reductions in the volume of free world trade with the bloc below the already declining levels of 1951.

United States.—United States trade in the first six months of 1952 continued at high levels, but was characterized by a moderate reduction in the large export surplus of late 1951. Total exports for January-June 1952 were \$7,976,000,000 compared with \$7,366,000,000 in January-June 1951 and \$7,664,000,000 in July-December 1951. Only military-aid shipments kept export values for the first half of 1952 above 1951 levels. In fact, in terms of volume, there was a slight decline in non-military exports in the first half of 1952 compared with the half year ending Dec. 1951.

Imports of the United States amounted to \$5,405,000,000 in the first half of the year, a figure 10% in value below the corresponding period of 1951 but 9% above the second half of 1951. Since average prices of goods imported by the United States dropped considerably from the mid-1951 high, the volume of imports in the first six months of 1952 was within 4% of the record level of the corresponding period a year earlier and 12% greater than the volume of the second half of 1951.

Geographically, the distribution of United States foreign trade followed the pattern of recent years in the first half of 1952. The Latin-American area was still, by a wide margin, the leading supplier of United States imports, providing about

one-third of the total. Canada, which furnished a little more than one-fifth, was the second ranking source, followed by the far east and Europe, each with slightly less than one-fifth. In striking contrast to prewar years was the sharply increased proportion of imports coming from Africa and the near east. In 1952 this proportion was around 8%, more than twice as high as the corresponding 1936-38 figure.

In United States export trade during the first half of 1952 Europe was as usual the principal destination, taking about one-third of the total. The next largest share—one-fourth—went to Latin America. Canada, with somewhat less than one-fifth, out-ranked the far east by a fairly narrow margin. Africa and the near east accounted for a much smaller proportion of the trade than any of the other regions.

Table II.—Selected Principal Commodities Traded by the United States

Canada.—Preliminary figures for the trade of Canada during the first eight months of 1952 showed an export surplus of approximately \$240,000,000 compared with a net deficit of \$336,000,000 at the end of Aug. 1951 (figures in terms of Canadian dollars used throughout this section). This important reversal was accounted for by a spectacular increase in exports to countries other than the United States, accompanied by a decline in imports.

Canada's exports, which totalled \$2,100,000,000 in the first six months, represented an

increase in terms of value of 20% over the similar period of 1951. Adjusting for price changes, this was a 17% increase. Imports, on the other hand, totalled \$1,950,000,000, a decline of about 8% compared with the imports in the first half of 1951. The falling off was almost entirely in consumer goods. Imports of capital goods expanded somewhat.

Trade with the United States continued to show a merchandise deficit. Imports fell slightly during the first six months, but exports remained about the same as in the first half of 1951. The United States, which had taken 64% of Canada's exports in January-June 1951, reduced its share in the same period of 1952 to 53%, although in terms of money value the amount was nearly the same.

The paramount factor in the heavy 1952 exports was the large overseas business in Canadian grain, lumber and metals. Canada's exports, for example, to the United Kingdom, in the January-June 1952 period were 55% higher than in the same period of 1951; exports to the other commonwealth countries were 40% higher and to western Europe about 67% higher. Canada's imports in the first six months, far from compensating for increased exports, showed declines with most major trading partners. The commonwealth countries' exports to Canada, including those of the United Kingdom, declined from \$371,000,000 in January-June 1951 to only \$253,000,000 in the same six months of 1952. Continental western Europe's exports were 7% less, leaving a large deficit in their trade balance with Canada.

The Canadian dollar continued to sell at premium prices in the United States, rising to a 19-year premium of 104½ in July. This reflected the country's extremely favourable export position in 1952 and the continued large influx of capital, largely from the United States.

Latin America.—The foreign trade of the 20 Latin-American republics in 1951 rose to high levels on both the export and import side. Only incomplete data were available for the first

Table IV.—Latin-American Trade

*Not available; estimated in total.

half of 1952, but these showed a tendency for imports to increase further in value and for exports to fall off to some extent for most countries with a few exceptions, of which the most important were Venezuela and Cuba.

Data from United States sources indicated that imports by the 20 Latin republics from the United States amounted to \$1,902,000,000 in the first half of 1952, about 2% less than in the last part of 1951 but well above any prior semiannual

totals except those of 1947. Exports from those countries advanced 13%, to \$1,661,000,000, a total exceeded only in the first six months of 1951 when a peak of \$1,872,000,000 had been reached. The \$241,000,000 excess of imports over exports, although contrasting sharply with an export surplus of \$65,000,000 a year earlier, was only about half as large as in the second half of 1951. The five principal trading partners of the United States in Latin America—Brazil, Mexico, Cuba, Venezuela and Colombia—took about 75% of United States total exports to that area, a slightly greater percentage than a year earlier.

Some of the republics, including Brazil, Argentina, Uruguay and Chile, found it necessary toward the end of 1951 to strengthen their controls over purchases from the United States. The surplus of imports over exports in merchandise trade continued in 1952 to be a drain on Latin-American dollar assets and an important factor in the rise in short-term commercial debts of some of the countries, especially Brazil. The Latin-American republics continued to enjoy substantially more favourable terms of trade in their transactions with the United States than prior to the Korean invasion in June 1950, despite some decline in those terms since the second quarter of 1951.

The advance in Latin-American exports to the United States in 1951 over 1950 was about 15%, compared with a 31% increase in their exports to the countries of the Organization for European Economic Cooperation (O.E.E.C.). For the first six months of 1952 there were indications that Latin-American exports to the United States almost equalled the half-yearly average for 1951, while shipments to the O.E.E.C. countries dropped. Substantial reductions in exports to the United Kingdom, Italy and Belgium greatly outweighed increases to Germany and Sweden. On the import side, it appeared that the United States continued in 1952 to supply about one-half of all Latin-American imports, or the same proportion as in 1951. In the first six months of 1952 there was a marked drop in imports from France, Italy and Sweden, although important increases from the United Kingdom, Germany and Belgium.

Western Europe.—Compared with the last half of 1951, the combined trade of the 17 European countries comprising the O.E.E.C. stagnated or fell during the first six months, and particularly the second quarter, of 1952. Exports of the group, which totalled \$14,293,000,000 in the second half of 1951, declined to \$13,878,000,000 in January-June 1952. Only the United Kingdom, the Netherlands, Greece and Turkey showed increases, and all of these were small. The O.E.E.C. member countries also showed a small import decline from \$17,201,000,000 in the second half of 1951 to \$17,102,000,000 in the first six months of 1952.

In terms of value, exports showed a decline to the level of the second quarter of 1951, about 60% above the 1948 level, but in terms of volume, the second quarter 1952 index of 163

(1948=100) was the lowest since the third quarter of 1950. The same situation obtained in regard to imports. The volume index of 124 in the second quarter of 1952 touched the lowest level since the third quarter of 1950 when the index was 116.

Table V.—Trade of O.E.E.C. Countries Combined, by Areas of Origin and Destination*

Country	Imports (i.o.b.) (In millions of dollars)			Exports (f.o.b.)

Eastern Europe	670	932	801	555	720	752
Other	1,459	1,206	1,214	839	828	928

*The O.E.E.C. countries are: Austria, Belgium-Luxembourg, Denmark, France, Federal Republic of Germany, Greece, Iceland, Ireland, Italy, Netherlands, Norway, Portugal, Sweden, Switzerland, Trieste, Turkey and United Kingdom.

The year 1952 saw a setback in the liberalization of intra-European trade. Large strides forward had been taken in western Europe, under the impetus of the Marshall plan, toward abolishing the restrictions on trade among the member nations of the O.E.E.C., but in early 1952 Europe's largest traders, the United Kingdom and France, reimposed quantitative restrictions on their imports. It should be noted, however, that Italy completely liberalized its trade with O.E.E.C. countries and that Germany also further liberalized its imports. Although the volume of intra-European trade varied widely in the postwar period, the general trend was a steady increase.

The first two quarters of 1952, however, showed a pronounced downward trend from the average of 1951. Despite this, the member countries remained each others' best customers, with approximately 47% of their exports being shipped to each other. Another 15% moved to the overseas territories of the member countries and the remainder went to nonmember countries.

The O.E.E.C. countries as a group in the first six months of 1952 showed a considerable increase in their gold and dollar payments deficit over the previous year. This could be accounted for in large part by their substantially increased imports from North America, which in the first quarter of 1951 amounted to 14% of their total imports and in the first half of 1952 amounted to 22%. At the same time the European nations were selling less to the United States and Canada. Western Europe sold only 8% of its exports during the first half of 1952 to North America.

The situation in the various O.E.E.C. member countries varied considerably. French foreign trade showed a serious deterioration during the first six months of 1952, compared with the corresponding period for 1951. In 1952 imports increased substantially and exports declined; so that the trade deficit rose from \$88,000,000 in January-June 1951 to \$474,000,000 in the same period of 1952, an increase of more than five times. French trade with the United States also showed a marked deterioration—exports declined by 17% between January-June 1951 and the same months of 1952 and imports increased by 20%, leaving a trade deficit of \$217,000,000 for the first six months of 1952 compared with \$105,000,000 for a like period of 1951. Italy, too, was running a large foreign trade deficit of about \$1,000,000,000 at an annual rate. Other countries showing increased trade deficits in the first six months included Austria, Portugal and Sweden.

On the other hand, several European nations made substantial improvements in their trade positions in the first six months. Notable among these were Germany, the Netherlands, Switzerland and Denmark. Germany emerged in the second quarter of

ITALIAN-MADE Vespa motor-scooters wheeling past an arch in Rome. These low-cost vehicles averaged about 125 mi. to the gallon of gas and were popular with families unable to afford automobiles. They reached the U.S. market in 1952 through a large mail-order house

1952 with a substantial trade surplus.

Belgium continued its surplus of the year before at a somewhat increased rate. Belgium's continuing extreme creditor position made necessary a new agreement within the European Payments union, as its export surplus continually outran agreed quotas. A solution was found at least temporarily under which Belgium received an additional payment from the E.P.U., extended further credit to members, increased its imports by placing defense orders in France and the United Kingdom and received a credit of \$50,000,000 from the International Monetary fund.

United Kingdom.—The first half of 1952 brought a substantial improvement over the preceding year in Britain's trading position. That country's adverse trade balance for this period totalled \$1,316,000,000, or \$518,000,000 less than that in the second half of 1951 and \$227,000,000 less than the figure for

the first half of 1951. The chief factor accounting for this improvement was an 8% decrease in imports, from \$5,762,000,000 in July–December 1951 to \$5,325,000,000 in January–June 1952. This decline in imports included a significant reduction, of approximately 14%, in purchases from nonsterling countries. The increase in the value of imports in the first half of 1952 over the same period of 1951 was accounted for by the fact that prices of goods purchased by the United Kingdom in the early months of 1952 were higher on the average than in 1951.

The value of United Kingdom exports in the first half of 1952 was \$3,772,000,000, which was almost identical with the latter half of 1951 but well above the first half, when exports totalled \$3,472,000,000. The significant change in the export picture was a drop of 13% between the value in the first and second quarters of 1952. This was accounted for in part by the new restrictions placed on imports by several commonwealth countries, but also to some extent by declines in the general demand for British exports.

Attempts to decrease the dollar trade deficit continued to be frustrated. While in the first half of 1951 this deficit with the dollar area totalled about \$417,000,000, the first six months of 1952 showed a deficit of \$679,000,000, an increase of 63%. Defense support aid from the United States, totalling \$300,000,000 for the period ending June 30, 1952, enabled Britain to maintain imports for supporting defense production on an otherwise impossible scale.

Table VII.—Value of United Kingdom Imports

Other imports	316	361	294

Britain's terms of trade in 1952 were decidedly more favourable than in the preceding year. Although import prices did not show a decline below the average for 1951 until June 1952 (and then only a one point reduction), the prices of exports increased slowly but steadily. The over-all export index (1951=100) was 106 for the first half of 1952, compared with 105 in the second half of 1951 and 95 in the first half.

Near East.—Egypt's favourable balance of trade of January–June 1951 of \$10,400,000 was turned into a deficit of \$130,000,000 in the corresponding period of 1952. This abrupt shift put a drain on the country's dollar and sterling balances and caused the government in July to intensify its exchange restrictions on luxury and semiluxury goods.

Israel's trade deficit remained almost unchanged from 1951 at an annual rate of about \$290,000,000. This deficit was met by Export-Import and other bank loans, new investment in Israel, United States grants and gifts from world Jewry.

Turkey's exports rose in the first six months by about 12% over the 1951 average. Imports, however, stepped up by Turkey's capital development program, rose by nearly 30% in the same period.

Following the withdrawal of the British from Iran with the

nationalizing of the oil industry there and the loss of gold from oil sales, Iranian exports dropped from a high of \$818,000,000 in 1950 to an annual rate of \$126,000,000 during the first half of 1952. Imports also fell, though far less drastically, as Iran drew on reserves for necessary supplies. These totalled \$169,000,000 at an annual rate during January–June 1952, compared with \$229,000,000 in 1951.

Union of South Africa.—The South African balance of payments on current account, in balance in 1950, showed a deficit of \$305,000,000 in 1951 which continued into 1952. The primary cause of this imbalance, in addition to declines in the values of exported goods, was an increase in imports, resulting from a relaxation of import controls in 1951. The government established quotas to curtail imports in 1952, allowing imports of industrial raw materials and maintenance parts at 75% of the 1951 level and of consumer goods at 66% of 1951 imports. These, together with the larger than anticipated inflow of foreign capital, were expected to secure a satisfactory balance of payments account for the year.

Far East.—India's foreign trade in the first six months of 1952 continued the adverse trend of the second half of 1951, with a deficit of \$730,000,000 at an annual rate compared with \$490,000,000 for the year 1951. As a result, India's sterling balances were drawn down by nearly 1,000,000,000 rupees.

The heavy decline in the first half of 1952 in the market prices of rubber and tin caused Malaya to have an adverse trade balance of \$13,600,000 compared with a favourable balance of \$320,400,000 during the same period of 1951. The United Kingdom continued to be Malaya's best customer, and Malaya obtained the major portion of its essential requirements from sterling sources. Shipments to the dollar area declined in value terms because of the sharp fall in rubber prices (tin shipments more than doubled in value), but new restrictions on imports from the dollar area enabled Malaya to maintain a favourable balance with the United States, although at a much lower level than in the corresponding period of the previous year.

The foreign trade of Hong Kong in January–June 1952 was much smaller than in the first six months of 1951. Exports declined by more than 50% and imports by more than 25%. The major cause of this change was the drastic reduction in trade with China, following the severe import and export controls introduced in Hong Kong in June 1951. The value of exports to China in the first six months was reduced to 15% of the level in the corresponding period of 1951. Imports from China declined to about 75% of their former level. Hong Kong's exports to the United States continued a steady decline as a result of the wider application of United States restrictions prohibiting importation of goods of China origin.

Japan's exports, which had increased rapidly between 1950 and 1951, as Japanese production climbed back to pre-World War II levels and well above, began to level off in the early months of 1952, and showed a slight downward movement in the second quarter. Imports showed declines from a year earlier of about 6%.

Among the remaining far eastern countries there was a fairly consistent trade pattern. Burma, Ceylon, Indonesia and the Philippines all reached record export levels in 1951, largely because of high prices for their leading export commodities, but, following severe declines in the prices of rubber, tin, copra and tea, their exports began to decline in the first quarter of 1952 and, particularly in Ceylon and Indonesia, dropped still further in the second quarter. In early 1952 imports were maintained at about the high level of 1951; then they tapered off in Ceylon and the Philippines but continued to climb in Indonesia and Burma.

Pakistan's exports in the first quarter of 1952 rose to their

highest level since the establishment of that country, and then fell abruptly in the second quarter. The reduction was primarily the result of a decline in world demand for cotton and jute. In order to stimulate exports of jute, it reduced export duties and prices substantially at the middle of the year. Imports, which had also risen to a record peak early in 1952, were put under restrictions in August after Pakistan's balance of payments deficit more than doubled between the first and second quarters.

Oceania.—New Zealand's trade showed a gain in exports, rising from \$693,000,000 in 1951 to an annual rate during the first quarter of 1952 of \$749,000,000. This was accomplished despite sharply decreased earnings on wool, since large shipments of meat to Great Britain at high prices tended to offset that loss. The increase in exports, however, did not begin to be large enough to pay for the 50% rise in imports—from \$596,000,000 in 1951 to an annual rate in January–March 1952 of \$908,000,000. Following agreements at the commonwealth conference in late 1951 to achieve a surplus of £25,000,000 with nonsterling countries, New Zealand reimposed exchange restrictions and other import control measures.

With the drastic decline in wool prices, the value of Australia's exports in the first six months of 1952 dropped to a level nearly 30% below the 1951 peak. Exports in 1951 totalled \$2,204,000,000; in January–June 1952, on an annual-rate basis, they were \$1,576,000,000. This latter figure represented a volume of exports about 12% above 1948.

Imports, many of which had been ordered under contract earlier, reached an all-time peak of \$3,144,000,000 at an annual rate during the first quarter of 1952. Severe restrictions on imports were imposed in March to halt the drain on reserves, and imports declined in the second quarter of 1952 to an annual rate of \$2,182,000,000, still nearly 15% above the 1951 level of \$1,911,000,000. The commonwealth treasurer, in presenting the new budget on Aug. 6, said that Australia's international reserves had fallen to £A362,000,000 on June 30, 1952, compared with £A843,000,000 a year earlier. He also stated that the import restrictions announced on March 8 had become fully effective and had brought Australia's immediate balance of payments problem under control. International Wheat Agreement: see AGRICULTURE; WHEAT.

Interstate Commerce Commission. The duties and powers of the Interstate Commerce commission are set forth in the Interstate Commerce act, passed in 1887 and later amended in many important particulars, and in related acts. The act is divided into four parts and deals with the regulation of railroads, oil pipe lines, motor and water carriers and freight forwarders. The commission's regulatory powers extend, among other things, to carrier charges; to questions involving the valuation and financial reorganization of railroads; to the issuance of securities; to acquisitions of control of carriers by other carriers or persons; to accounting practices and the filing of reports; and to matters involving proposed institutions of new services by motor and water carriers or freight forwarders or the construction, abandonment and operation of lines of railway.

Only minor amendments were made in the act in 1952, but various proposals, some involving important changes, received public discussion. Chairman John L. Rogers resigned as of April 30 for reasons of health and was succeeded as chairman by Com-

missioner J. Haden Alldredge. Commissioner Clyde B. Aitchison, longest in service of any commissioner, retired on July 10. Commissioners Anthony F. Arpaia and Martin Kelso Elliott succeeded to these vacancies. Commissioners Charles D. Mahaffie and J. Haden Alldredge were reappointed for seven-year terms.

Increased costs and an unsatisfactory credit situation led to the granting of a further advance in railroad freight rates, effective generally on May 2 and until Feb. 28, 1954. The authorized increases since mid-1946 aggregated 78.9%. Competition and other factors had caused, however, a lesser actual overall increase. Generally, the rates of other carriers advanced in the year.

Notable progress was achieved on May 30, when, after long investigation, uniform rail class rate scales became effective east of the mountain-Pacific territory and a uniform classification became applicable country-wide.

Diesel power and other technological improvements made further contributions to transportation. The extensive car shortage which followed the beginning of hostilities in Korea had declined, but lack of materials and other factors had caused inadequate additions to car supplies. Other carriers felt the effects of shortages of materials.

Aside from increased costs, regulated carriers faced such problems as passenger-train deficits, high costs of handling small shipments, extensive competition of private and exempt carriers, insufficient control of leased motor vehicles, work stoppages and shifts in industry locations, air transport competition, highway and street congestion and uncertain international conditions. The transportation milieu was one of severe interagency and other competition, with marked complication of the problems of the commission. Its staff had become seriously inadequate in size. (See also RAILROADS.) (J. H. A.)

Intestinal Disorders: see STOMACH AND INTESTINES, DISEASES OF THE.

Intoxication, Alcoholic. Advances during 1952 in the fields of medicine, psychiatry and social work, together with expanding programs of community action, made more evident the effectiveness of dealing with alcoholism as a public health problem.

The medical profession continued its active interest in alcoholism. In March at the fourth annual Assembly of General Practitioners in Atlantic City, N.J., a seminar in diagnosis, management and rehabilitation of alcoholics was conducted with representatives of many other organizations participating.

A survey showed that 38 states had passed bills for the control and prevention of alcoholism, and that these state programs varied from those which were in their beginning stages to some which were carrying out broad, well-planned programs of active rehabilitation.

As a result of another survey, it was shown that there were 43 alcoholic clinics in the country; some functioned as parts of state tax-supported programs, and some under the auspices of municipal health departments, while still others were operated by voluntary social agencies.

Another survey indicated that more than 1,300 hospitals were accepting intoxicated persons for in-patient hospital care during the acute phase of this condition, compared with 97 hospitals which did so in 1944.

On the voluntary level, there were 60 local committees conducting active programs which were stimulated and guided through the efforts of the National Committee on Alcoholism. There were also 36 information centres for the guidance of alcoholics and their families which had been established by local committees.

As a result of the efforts of local committees and state sponsored programs, more schools were revising their curricula and introducing more scientific concepts in their texts than in preceding years. The Yale summer school of alcohol studies was attended by 165 persons, representing many different fields of scientific and social activity.

An outstanding development in the field of education was the evening course in problems of alcoholism in industry and business, given for the first time in the fall of 1952. This course was offered to meet the needs of businessmen and industrial workers, and was co-sponsored by the Boston Committee on Alcoholism and the Personnel Managers Club of the Boston chamber of commerce.

World-wide interest in the problem, and the growing participation of national and international health agencies in the study of this illness, had brought about a most important development whereby complete sets of the subject-classified archive of the alcohol literature of the Yale Center of Alcohol Studies could be placed in depository libraries in many parts of the world. This project was made possible by the interest of the World Health organization.

Tetraethylthiuram disulphide (Antabuse) had been established as a useful tool, although its indications and limitations were quite clear. Vitamins were considered definitely important in treatment. The use of ACTH and cortisone remained in the experimental stage. The standard (sedative) and analgesic drugs were being widely used, especially for symptomatic relief and for the "hangover."

There was evidence that joint treatment methods, combining ministrations of medical adjuncts with psychotherapy and group work of the Alcoholics Anonymous, were being successful where single methods had previously failed. (See also LIQUORS, ALCOHOLIC; PSYCHIATRY.) (M. Mo.)

Iowa. Iowa, popularly known as the "Hawkeye state," was admitted to the union in 1846. Located in the north central region, it comprises 56,290 sq.mi., of which 245 sq.mi. are inland water surface. The census figures for 1950 showed a population of 2,621,073, an increase of 3.3% over the 1940 figure; 52.3% were rural, a decrease of 4% since 1940. The capital and largest city is Des Moines, with a 1950 population of 177,965. Other chief cities are Sioux City, 83,991; Davenport, 74,549; Cedar Rapids, 72,296; Waterloo, 65,198; Dubuque, 49,671; and Council Bluffs, 45,429.

History.—The general assembly of the state meets biennially in the odd-numbered years. The next assembly was to convene in Jan. 1953. Iowa's state officers in 1952, all Republicans and elected in 1950, were: governor, William S. Beardsley; lieutenant governor, W. H. Nicholas; secretary of state, Melvin D. Synhorst; auditor, Chet B. Akers; treasurer, M. L. Abrahamson; secretary of agriculture, Clyde Spry; attorney general, Robert L. Larson. Iowa's United States senators were Bourke B. Hickenlooper (Republican, re-elected 1950) and Guy M. Gillette (Democrat, elected 1948). Iowa's eight representatives in congress were Republicans.

Education.—During the 1950-51 school year Iowa had 3,813 public elementary school districts; 836 public high school districts; and 16 junior colleges. The elementary schools in the 1950-51 school year had 370,614 students; the high schools, 114,935. The junior colleges, in 1951-52, had 1,642 students. The number of teachers and superintendents in the public schools in 1950-51 was 23,045.

There were 26 colleges and universities in the state, with a total 1952 enrolment of 29,315. The state supports three institutions: the State University of Iowa, Iowa City; the Iowa State College of Agriculture and Mechanic Arts, Ames; and the Iowa State Teachers college, Cedar Falls. The enrolment at these three schools for the fall semester of 1952 was 17,094, an increase over 1951 of 133; of this number, 1,384 were veterans, a decrease of 1,390 from 1951.

The state superintendent of public instruction is Jessie M. Parker. The state appropriated for school aid in the legislative session of 1951 a total of \$45,872,500 annually for the 1951-53 biennium.

Social Insurance and Assistance, Public Welfare and Related Programs.—The 1952-53 state appropriation for old-age assistance was \$14,500,000; for aid to dependent children, \$2,175,000; for child welfare, \$220,000; for emergency relief, \$40,000; and for aid to the blind, \$275,000. Contributions to the state unemployment fund, as of June 30, 1952, were \$4,316,563.81; during the fiscal year 1951-52, \$4,015,959.89 was paid out of this fund in benefit payments. The reserve fund, as of June 30, 1952, totalled \$105,792,009.06.

Iowa's three penal and two correctional institutions had 2,445 inmates as of Aug. 31, 1952. The hospitals for the insane numbered four, with 5,663 patients; there were also two homes for the feeble-minded, with 3,443 patients. Other state institutions are the orphanage at Davenport and the State Juvenile home at Toledo.

Communications.—Iowa has a total of about 5,800 mi. of paved highway and 62,000 mi. of gravelled roads. The state is served by 12 major railroads. Class I roads have a total of 8,584 mi. of track. In 1951 these roads carried 4,979,273 passengers and 104,810,855 tons of freight. There are 356 mi. of electric interurban roads in the state; during 1951 they carried 422,476 passengers and 4,419,079 tons of freight. The number of passengers carried by motorbus during 1950 was 19,170,286. There were, in 1951, 110 mi. of oil pipe line, 1,679 mi. of gasoline pipe line and 2,215 mi. of natural gas pipe line in Iowa. In 1952 there were about 893,000 automobiles and 190,000 trucks in Iowa. The state is served by three national air lines. There are ten major airports in the state.

There were in 1952 about 836,000 telephones in Iowa, 53 radio stations and 2 television stations. There were about 70,000 mi. of electric transmission lines in the state and 86.2% of all farms were electrified.

Banking and Finance.—There were, as of June 30, 1952, 558 state banks in Iowa. In addition, there were 164 bank offices, 229 small loan licensees and 222 credit unions under the supervision of the state banking department. Total assets of the 558 state banks on June 30, 1952, were \$1,684,776,491 (an increase of \$28,733,554 over the 1951 figure); total deposits were \$1,555,087,192 (an increase of \$18,472,210 over the 1951 figure). As of March 31, 1952, there were 97 national banks in Iowa, with total deposits of \$817,826,000 and total resources of \$834,768,000.

The revenue received from all special taxes in Iowa for the fiscal year ending June 30, 1952, was \$177,958,478.86, compared with \$172,915,486 in 1951. The largest single item was the state 2% sales tax, which brought in \$52,507,742.34; the gasoline tax amounted to \$39,734,736.34; the motor vehicle tax, \$32,474,556.10; the income tax, \$22,990,612.48. From these tax receipts, \$95,323,490.17 went in the general fund of the state; the balance to the road use fund, Iowa has no state debt. Real estate taxes, assessed locally, totalled \$210,665,469 in 1952.

Agriculture.—Agriculture is the leading industry in Iowa. The state has 25% of all the grade A farmland in the nation and produces more than 10% of the nation's food. There were 199,427 farms in Iowa in 1951, compared with 200,401 in 1950. These farms had a total acreage of 34,714,546 ac.; the average size was 174.1 ac. Of the total Iowa farms, 49.9% were owner-operated and 50.1% were tenant-operated.

The total cash income of Iowa farmers for 1951 was \$2,372,705,000; of this total, \$2,070,725,000 was from livestock; \$290,270,000 from crops; and \$11,710,000 from government payments. The total farm income was \$257,836,000 more than in 1950. On Jan. 1, 1952, there were 49,262 auto trucks on Iowa farms; 252,392 tractors, 65,865 grain combines and 98,700 mechanical corn pickers; all figures showing an increase over the 1951 figures.

Table I.—Principal Crops of Iowa

Crop	Indicated 1952	1951	Average 1941-50
Corn, bu.	680,337,000	471,780,000	532,801,000
Oats, bu.	215,320,000	182,886,000	205,288,000
Wheat, bu.	3,530,000	2,212,000	4,160,000
Barley, bu.	728,000	693,000	1,712,000
Rye, bu.	135,000	140,000	210,000
Potatoes, bu.	1,250,000	1,040,000	2,889,000
Hay, tons	6,754,000	6,961,000	5,497,000
Timothy seed, lb.	12,800,000	10,200,000	27,450,000
Soybeans, bu.	34,525,000	32,508,000	33,537,000

	1952	1951
Hogs	12,882,000	13,321,000
Cattle	5,507,000	5,208,000
Sheep	1,280,000	1,021,000
Horses	177,000	205,000
Mules	6,000	5,000

Manufacturing and Industry.—There were 3,856 manufacturing plants in Iowa in 1951, employing approximately 167,000 persons. The average weekly wage in 1951 was \$66.39. The estimated value of all manufactured products during 1951 was \$2,700,000,000. (M. Tr.)

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Iowa in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Iowa ranks 33rd among the states in value of its mineral output, with 0.35% of the U.S. total.

Table III.—Mineral Production of Iowa

(Short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Cement (bbl.)	7,232,000	\$16,158,000	6,655,000	\$14,602,000
Clays	579,000	645,000	572,000	629,000
Coal	1,891,000	6,977,000	1,724,000	6,912,000
Gypsum	982,000	2,508,000	858,000	2,188,000

Stone	8,995,000	4,796,000	7,978,000	4,447,000
Other minerals	21,000	...	17,000
Total		41,773,000		37,458,000

Iran (PERSIA). An independent kingdom of western Asia, Iran is bounded east by Pakistan and Afghanistan, north by the U.S.S.R., west by Turkey and Iraq and south by the Persian gulf and Arabian sea. Area: c. 634,413 sq.mi. Pop. (1951 est.; no census ever taken): 20,000,000. Language: mainly Persian, but Turki and Armenian in the northwest, Kurd in the west, Arabic in the south and Pashtu in the east. Religion: Moslem, mainly Shia but Kurds (750,000) are Sunni; Christian c. 50,000 Gregorian Armenians, a few thousand Catholic Armenians and 40,000 Nestorians; Jewish 80,000; and c. 10,000 Zoroastrian Parsees. Chief towns (1948 est.): Tehran (cap. 850,000); Meshed (250,000); Tabriz (214,000); Isfahan (205,000); Abadan (150,000); Shiraz (129,000); Resht (122,000); Hamadan (104,000). Ruler: Shahanshah Mohammed Riza Pahlavi; prime ministers in 1952: Mohammed Mossadegh (q.v.), Ahmed Ghavam es-Saltaneh (July 17-21) and again Mohammed Mossadegh.

History.—The year 1952 opened with the long-delayed elections to the 17th *majlis* (lower house of parliament) still in progress and the dispute between Great Britain and Iran over the ownership of the oil industry still unsettled. In Tehran the elections were completed during January, and all 12 seats were won by candidates of the National Front, Mohammed Mossadegh's government coalition. In the provinces, disorders and irregularities led to the suspension of the elections during February, when only some of the northern provinces had chosen their representatives; and even in some of these there was more than one claimant to some of the seats. When the *majlis* assembled in April, only 80 members were certified as legally elected, out of a full complement of 136, so that parliamentary sittings regularly took place with a bare quorum of members.

An attempt initiated in Dec. 1951 by representatives of the International Bank for Reconstruction and Development to negotiate a settlement of the Anglo-Iranian oil dispute ended in failure during March 1952. Mossadegh ordered the closure of all British consulates in Iran (except the administrative consulate at Tehran) by Jan. 21, on the grounds that the consuls were habitually interfering in Iranian affairs. Later in January, Mossadegh's government publicly refused its approval of the appointment of the new British ambassador, nominated in succession to Sir Francis Shepherd. Iranian relations with the United States also became more uneasy, and it was only after a period of uncertainty that the contract for the U.S. military and policy missions was renewed.

On the other hand, the Iranian government pursued friendly relations with most of the "iron curtain" countries. Trade agreements (including provision for the sale of oil) were concluded during the year with Hungary and Czechoslovakia, and were under negotiation with the U.S.S.R. and Poland. Frontier disputes with the U.S.S.R. were tacitly suspended, and the contractual date of termination of the soviet-Iranian fishery concession on the Caspian sea was allowed to pass without any attempt to enforce it. Because of the shortage of oil tankers, however, the National Iranian Oil company had no more success in selling oil to these countries than to private firms in other parts of the world. Despite many inquiries and negotiations (including offers from the United States, Italy, Japan,

LEGAL COUNSEL for the Anglo-Iranian Oil Co. conferring with an Aden official (in shorts) over seizure of a tanker carrying oil sold by Iran to Italy. The vessel pulled into Aden for repair in June 1952 and was held by injunction of the oil company which claimed the cargo was illegal while the nationalization of Iranian oil was still in dispute

India and South American countries), the only successful sale of oil made during the early part of the year was to an Italian company which was able to send a small tanker, the "Rose Mary," to take delivery. This ship was impounded at Aden during its return journey, pending a legal decision on the ownership of the oil.

As a result of the loss of oil revenues, the financial and economic position of the country became increasingly precarious, and the Communist-controlled Tudeh party became increasingly active and successful. Revenue only kept pace with expenditure by means of repeated loans from the National bank, and eventually by a surreptitious increase of the note issue. A national loan, launched by the government, was only moderately successful. In the industrial centres unemployment increased and disorders spread. At the end of May, Mossadegh dramatically flew to The Hague to conduct Iran's case at the International Court of Justice, which met in June to determine whether or not it was competent to adjudicate in the dispute between the British and Iranian governments.

On June 24, when the International court had completed its hearings, but before it had announced its decision, Mossadegh returned to Tehran. There followed an acute political crisis, arising from the growth of opposition to Mossadegh in the *majlis* and especially in the senate. He was constitutionally bound to present his formal resignation to the newly assembled *majlis*, which he did early in July. The *majlis* and the senate then voted that he should be reappointed prime minister, but did so in such a halfhearted manner that he refused to resume office unless he was granted full powers for six months to carry out a program of reforms. Part of his price was that he should himself be appointed minister of war; but the shah refused his

consent, on the ground that such an appointment would infringe his own control over the army. Mossadegh thereupon resigned again and on July 17 the *majlis* voted for Ahmed Ghavam es-Saltaneh in his place.

Ghavam was prime minister for barely four days. On July 21 riots broke out in Tehran at the instigation of Ayatollah Kashani (*q.v.*) and with the skilled co-operation of the Tudeh party. The Tudeh party, although officially outlawed since Feb. 1949, emerged unopposed and took control of the rioting mobs of Tehran. The shah personally ordered his troops, which had been called out to control the riots, to return to their barracks; and Ghavam, who was thus deprived of effective power, resigned in despair and went into hiding. On July 22 Mossadegh became prime minister again and the riots ended; on the same day The Hague court announced that, as Mossadegh had contended, it was not competent to adjudicate in the oil dispute.

The *majlis* then voted to Mossadegh the full powers which he had demanded, but he made little use of them. His efforts were again concentrated against the British. On Aug. 7, in a new note, he made a new but ambiguous offer to negotiate on the oil dispute. The reply, on Aug. 30, was a joint Anglo-American offer of terms, but these were at first indignantly refused. Encouraged perhaps by the arrival in Iran of Hjalmar Schacht, the German financial expert, and Alton Jones, president of a large U.S. oil company, Mossadegh was surer than ever that he could do without the British. On Sept. 24 he made written counterproposals, which included a demand for £49,000,000 (payable in dollars) as a precondition of any negotiation, this sum being allegedly owed to Iran by the Anglo-Iranian Oil company under the supplemental agreement of 1950 which the Iran government had refused to ratify. This "last offer" by Mossadegh was accompanied by public (but unofficial) threats to sever diplomatic relations if it were not accepted within ten days. (See also AGRICULTURE; SYRIA.)

Education.—Schools (1948): elementary 3,229, pupils, 386,266, teachers 14,781; secondary 284, pupils 36,353, teachers 2,350. Universities 2 (Tehran and Tabriz); university colleges 3.

Finance and Banking.—Budget (1950–51 est.) revenue 8,950,000,000 rials, expenditure 11,470,000,000 rials; (1951–52 est.) revenue 9,553,000,000 rials, expenditure 9,550,000,000 rials. Internal national debt (Dec. 1951): 7,360,000,000 rials. Currency circulation (March 1952) 6,810,000,000 rials. Gold and foreign exchange (Aug. 1952) U.S. \$181,000,000. Monetary unit: rial with an exchange rate of 91 rials to the pound sterling and 32.50 rials to the U.S. dollar.

Foreign Trade.—(1951): Imports 7,370,000,000 rials; exports 11,270,000,000 rials. Main sources of imports (1950): U.S. 26%; U.K. 29%; India 10%; Germany 6%; U.S.S.R. 5%; main destinations of exports: U.K. 26%; India 8%; France 5%; South Africa 5%. Principal imports (1950): cotton piece goods 13%; machinery and tools 12%; sugar 12%; tea 7%. Principal exports: petroleum 86%; rugs and carpets 2%.

Transport and Communications.—Roads (1948): 17,000 mi. (8,000 mi. suitable for vehicles). Licensed motor vehicles (1950): cars 12,000, commercial vehicles 12,000. Railways (1949): 1,750 mi.; passengers carried (1947) c. 1,600,000; freight carried (1948) c. 1,000,000 metric tons. Iranian airways: unduplicated route miles (1950) 5,077. Radio receiving sets (1950): 184,000.

Agriculture and Fisheries.—Main crops (metric tons, 1951): wheat 1,800,000; barley 740,000; cottonseed 41,000; jute (1950) 4,000; sesame seed (1950) 9,500; rice 360,000; sugar (raw value) 78,000; tea (1950) 7,600; tobacco (1950) 17,000; oranges and tangerines 46,000; olives (1950) 12,000; olive oil (1950) 1,000. Livestock (1950–51): cattle (1951) 3,900,000; sheep (1951) 8,520,000; horses 365,000; mules (1948–49) 42,000; buffaloes 10,000; camels 600,000; goats 7,000,000; chickens 13,000,000. Livestock products (metric tons, 1950): wool (clean basis) 9,000; butter 40,000. Fisheries (production of Société Mahie): sturgeon catch c. 5,000 tons, giving c. 30 tons of caviar.

Industry.—Fuel and power: coal (1948) 150,000 metric tons; crude petroleum (1951) 16,848,000 metric tons; electricity (1948) 200,000,000 kw.hr. Raw materials (metric tons, 1950 est.): copper ore 1,000; sulphur 600; red oxide 10,000; arsenic ore 500. Manufactures: cotton yarn (1949) 12,000 metric tons; cotton piece goods (1949) 30,000,000 m.; cigarettes (1950) 4,192,000,000; tobacco (1950) 3,848,000 metric tons; cement (1948) 58,000 metric tons.

Iraq. An independent Arab kingdom of Mesopotamia, Iraq is bounded by Syria, Turkey, Iran, the Persian gulf, Saudi Arabia and Jordan, and watered by the Tigris and Euphrates rivers. Area: 168,040 sq.mi. Pop.: (1950 est.) 5,100,000. Language: Arabic 67%, Kurdish 25%, others 8%. Religion: Mos-

lem 93.5%, Christian 5%, others 1.5%. Chief towns (pop., 1947 est.): Baghdad (cap., 552,000); Mosul (279,400); Basra (206,000); Kirkuk (148,300). Ruler, King Feisal II; prime ministers in 1952: Nuri Pasha es-Said and (from July 12) Mustafa el-Umari.

History.—In Jan. 1952, Averell Harriman, the director of the Mutual Security agency, announced that Iraq would be debarred from U.S. technical and economic aid because of its failure to comply with the provision of the Mutual Security act requiring recipients to contribute fully to the defense of the free world and to develop their capacity for self-defense to the best of their ability. In February the commander in chief of the British forces in the middle east visited Baghdad to discuss with the Iraqi government questions of collective security and the supply of war material and equipment. On March 16 the Iraqi parliament ratified the Arab security and economic aid pact which eventually came into force on Aug. 23 after it had also been ratified by Egypt, Syria, Jordan and Saudi Arabia.

In July, on the termination of the existing five-year financial agreement between the British and the Iraqi governments, a further agreement was signed by both countries by which Iraq's remaining blocked sterling balance (about £23,000,000) was released by the British government. The Iraqi government had expressed its intention of continuing to hold part of this money as part of the cover for Iraq's currency. It had also been agreed to set up machinery for regular exchanges of information on financial and economic matters and that Iraq's financial relationship with Great Britain would continue on the basis of common membership of the sterling area.

In May the Amir Abdul-Ilah, the regent of Iraq, accompanied by Nuri Pasha es-Said, the prime minister, paid a state visit to Spain. In August King Feisal II of Iraq visited the United States where he was the guest of Pres. Harry S. Truman. On his return he visited Great Britain and, with the regent, was the guest of Queen Elizabeth II at Balmoral.

Earlier, in June, the regent visited Amman at the time of the breakdown of the health of King Talal of Jordan. He advanced the view that as the question of the Jordan throne concerned the Hashemite family, a senior representative of that house should preside over the proposed council of regency in Jordan. But the Jordan cabinet rejected his contention.

In January the Iraqi prime minister, Nuri Pasha es-Said, when opening the new Zubair oil field near Basra, stressed the reliance of Iraq's economic development on the development of the Iraqi oil industry. On Feb. 7 the Iraqi government signed an agreement with the Iraq Petroleum company under which profits would be shared equally between the two parties. It was ratified a week later by the Iraqi chamber of deputies and by the senate. On April 23 the construction of the Iraq Petroleum company's transdesert pipe line from Kirkuk to Baniyas on the Syrian sea coast was completed. It was 556 mi. long.

On July 9 Nuri Pasha es-Said resigned and was succeeded as prime minister by Mustafa el-Umari. The new cabinet, announced on July 12, was a nonpolitical administration.

Throughout the year the program of the Iraq Development board made progress. In January the contract for the digging of the 40-mi. escape canal from Samarra on the upper Tigris to the Wadi Tartar depression was awarded to a British firm. The work would take four years to complete, and was designed to avert the flooding of the low-lying country along the river from Baghdad to its mouth. A further sum of 40,000,000 Iraqi dinars was being devoted to local flood control and land reclamation along the southern reaches of the river. In the north a large scheme for the boring of artesian wells had already made much progress. The resulting supplies of water were intended for crop irrigation to encourage the nomadic tribes to settle permanently

on the land. Finally, in June a contract for the building of a barrage across the Euphrates at Ramadi was awarded to a French company.

A trade agreement was signed in May between the Iraqi and the west German governments. (O. M. T.)

Education.—Schools (1949–50): primary 1,194, pupils 196,336, teachers 6,740; intermediate 133, pupils 22,899, teachers 492; secondary 71, pupils 7,222, teachers 983; vocational 10, students 1,275, teachers 64. Institutions of higher education 10, students 5,200, lecturers 124.

Finance and Banking.—Budget (1949–50): revenue 27,000,000 Iraqi dinars, expenditure 32,000,000 Iraqi dinars; (1950–51 est.) revenue 27,000,000 Iraqi dinars, expenditure 28,000,000 Iraqi dinars. Currency circulation (July 1952) 30,000,000 Iraqi dinars. Bank deposits (April 1952) 17,300,000 Iraqi dinars. Monetary unit: Iraqi dinar at par with the pound sterling and with an exchange rate of 0.357 Iraqi dinars to the U.S. dollar.

Foreign Trade.—(1951) Imports 51,000,000 Iraqi dinars; total exports 159,300,000 Iraqi dinars, oil exports 30,100,000 Iraqi dinars. Main sources of imports (1951): U.K. 34%; U.S. 14%; Italy 7%; Ceylon 5%. Main destinations of exports: U.K. 36%; the Netherlands 14%; India 10%; Japan 7%. Main imports (1949): textiles 18%; tea and sugar 12.6%; iron and steel 12.1%; boilers 11.1%. Main exports (1951): oil 51%; barley 21%; dates 9%.

Transport and Communications.—Roads (1949): 4,500 mi. Licensed motor vehicles (Dec. 1950): cars 8,789; commercial 10,292. Railways (July 1949): 1,027 mi. Traffic (1947–48): passenger-miles 329,000,000; cargo-miles 367,000,000. Air transport (1949): passenger-miles 5,861,000; cargo net ton-miles 118,600. Telephones (1951): 17,630. Radio receiving sets (1950): 30,000.

Agriculture.—Main crops (metric tons, 1950): barley 900,000; wheat (1951) 650,000; rice (1951) 180,000; dates (1949) 170,000; tobacco 60,000; cotton, ginned 8,000; cottonseed (1951) 17,000; wool, clean 20,000; livestock (1949): sheep 7,055,000; goats 1,849,000; cattle 1,322,000; buffaloes 130,000; camels 291,000; horses (1950) 184,000; donkeys 52,000; donkeys 413,000.

Industry.—Industrial establishments (1948): 1,762; persons employed 127,248. Fuel and power: crude oil production (1951) 7,980,000 metric tons; electricity (1949, public utilities only) 38,000,000 kw.hr.

Ireland, Northern. The six counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone together form a part of the United Kingdom of Great Britain and Northern Ireland. Northern Ireland has its own parliament and executive (with limited powers for local purposes) and is represented in the United Kingdom parliament by 12 members. Area: 5,451 sq.mi. Pop.: (1937 census) 1,279,745; (1951 census) 1,370,709. Language: English. Religion (1951 census): Roman Catholic 471,329 (34.39%), Presbyterian 410,259 (29.93%), Anglican 353,025 (25.75%), Methodist 66,544 (4.86%), other (or not stated) denominations 69,552 (5.07%). Chief towns (pop.: first figure, 1937 census; second figure, 1951 census): Belfast (cap., 438,086; 443,670); Londonderry (47,813; 50,099); Bangor (16,284; 20,615). Governors in 1952, the Earl Granville and (from Dec. 1) Lord Wakehurst; prime minister, Viscount Brookeborough of Colebrooke (formerly Sir Basil Brooke).

History.—The death of George VI in Feb. 1952 was mourned throughout the province and the accession of Elizabeth II was proclaimed. The Earl Granville resigned from the office of governor of Northern Ireland in September and Lord Wakehurst was appointed as of Dec. 1, 1952. The year was politically uneventful, local government elections in May showing a light poll and little change, but the economic situation attracted much attention.

Recession in the textile industries caused rising unemployment, reaching 53,154 workless in February, the highest figure since the end of World War II, and the ministry of supply placed shirt orders worth £1,200,000 with 23 Northern Ireland firms in an attempt to reduce it. In March four Northern Ireland cabinet ministers and six United Kingdom ministers discussed in London problems of production, raw materials and employment affecting Northern Ireland, and as a result further government textile contracts were placed. Peak unemployment was 60,353 in July, falling to 43,434 in September. In August an improvement was reported in the linen industry: estimated 1951 linen exports were 51,492,000 yd., the greatest since 1939.

Insufficiency of steel allocation was the subject of official

talks in January. The Belfast shipbuilding industry had produced in 1951 a total tonnage of 118,534 tons and total engine output of 85,595 hp., taking second place in the world for tonnage output of a single shipbuilding yard. Several big vessels were launched in 1952, including the 28,500-ton tanker "British Skill," the 17,000-ton Union Castle liner "Braemar Castle" and 18,500-ton oil tanker "Janova." Several smaller ships were launched and work was begun on a 32,000-ton tanker and other vessels. On a decision of the admiralty, work began on making three additional shipbuilding slips in Belfast for the construction of minesweepers and other naval craft. Work on the production of Comet jet bombers in Belfast made much progress and plans were put in operation for production of Comet jet air liners.

Agricultural production fell during 1951. The number of cattle, sheep and poultry fell, but pigs increased. The area under tillage decreased. Total visible exports for 1951 were £217,071,000 and imports were £261,467,000. The chief exports were linen and rayon goods valued at £47,000,000, cotton goods £15,816,000, livestock £15,412,000 and machinery £12,590,000. The 1952 budget provided for an increased "imperial contribution" of £20,500,000 to the United Kingdom exchequer. Legislation was passed providing for the same new allowances, benefits and charges in health and social services as in Great Britain. There was acute controversy over the government's proposal to restrict press reporting of preliminary court hearings of cases which might later come before a jury.

An inquiry into the operation of the Ulster Transport authority opened in March. A new system of one-way streets was applied to congested traffic areas in Belfast. Extensive new buildings were begun for Queen's university, Belfast. Heavy rain in August helped to prevent serious water shortage in some towns but flooded 2,000 houses in Belfast. Increased Belfast water supply from Silent valley was opened. (Hu. S.)

Education.—Schools (1951): nursery 23, pupils 709; primary 1,629, pupils 192,736; special (including hospital special schools) 13, pupils 776; secondary intermediate 12, pupils 6,785; secondary grammar 80, pupils 29,536; technical intermediate 29, pupils 4,901; institutions of further education 120, pupils 27,024. Queen's university of Belfast, students 2,686.

Finance and Banking.—Budget: (1951–52 actual) revenue £46,568,698 including £36,700,000 from U.K. exchequer, expenditure £46,454,419 excluding contribution of £19,000,000 to U.K. exchequer; (1952–53) revenue £75,715,000 including £42,000,000 from U.K. exchequer, expenditure £75,651,000 including contribution of £20,500,000 to U.K. exchequer. National debt (March 1952) £29,000,000.

Foreign Trade.—(1951) Imports £261,000,000 of which £205,000,000 from and through Great Britain; exports £217,000,000 of which £206,000,000 to and through Great Britain. Main direct sources of imports, excluding Great Britain (1951): Irish republic 24.3%; Belgium 15.7%; Canada 8.7%; U.S.S.R. 8.4%. Main direct destinations of exports, excluding Great Britain: Irish republic 35.5%; Norway 26.6%; U.S. 4.3%; Italy 2.9%. Main imports (1951): cotton goods, including goods sent for finishing, etc., 9%; machinery 5.7%; coal 5.6%; tobacco 3.2%. Main exports: linen and rayon piece goods 21.7%; apparel 7.1%; cotton goods, including goods sent for finishing, etc., 7.3%; livestock 7.1%.

Transport and Communications.—Roads (1951): 13,255 mi. Licensed motor vehicles (Sept. 1950): cars and cycles 59,268, commercial including tractors and hackneys 43,135. Railways (1951): 743 mi.; passengers carried (1950–51): 18,787,441; livestock transported (1950–51): 678,772 head; merchandise carried (1950–51): 1,740,752 tons. Telephone stations (Sept. 1952) 80,016.

Agriculture.—Main crops (metric tons, 1951): oats 299,000; potatoes 1,216,000; wheat 1,400; barley 3,300; dredge corn 4,400; hay 758,000; turnips 180,000; mangels 14,900; flax fibre 4,000. Livestock (mid-1952): cattle 941,000; sheep 795,000; pigs 676,000; goats and kids 8,000; horses 35,000; asses 5,000; poultry 16,456,000. Food sales (1951–52): milk 86,000,000 gal.; eggs 55,000,000 doz.; pork 970,000 cwt. Number of animals sold to the ministry for slaughter: cattle (including calves) 345,000; sheep and lambs 352,000. Shipment of food to Great Britain (1952): milk 4,000,000 gal.; eggs 39,000,000 doz.; poultry 6,037 tons; bacon and ham 25,000 tons.

Industry.—Electricity sales (1951) 684,000,000 kw.hr. Merchant vessels launched (1951) 10, gross tonnage 118,174. Exports of yarns (1951): linen 10,469,000 lb.; woollen 2,464,000 lb.; cotton 881,600 lb.; hemp 1,680,000 lb.

Ireland, Republic of. An independent republic on an island west of Great Britain, Ireland has an area of 26,602 sq.mi. Pop.: (1946 census) 2,955,107; (1951 census) 2,958,878. Language: English c. 76%, Erse

(Gaelic) c. 24%. Religion (1936 census): Roman Catholic 93.4%, Episcopalian 4.9%, Presbyterian 1%, Methodist 0.3%, Jewish 0.1%. Chief towns (pop. 1951 census): Dublin (cap., 521,332), Cork (74,577), Dun Laoghaire (47,963), Limerick (50,823), Waterford (28,689). President in 1952, Sean T. O'Kelly (O'Ceallaigh); prime minister, Eamon de Valera.

History.—Economic rather than political issues dominated the parliamentary scene in 1952. The government of Eamon de Valera, risking the possible defection of its independent supporters in the *dail eireann*, and thereby endangering its precarious working majority, took a strong line in finance. For the same kinds of reasons that operated elsewhere in the sterling bloc, the budget imposed, for the hitherto fortunately situated Irish citizen, what amounted to drastic increases in taxation. The opposition immediately tried to make political capital out of the increases; the public, however, seemed to accept them with varying degrees of resignation, and the government went on its way, if not rejoicing, at any rate with a firmness that might appear incompatible with the slenderness of its majority in the *dail*.

While economics continued to mould politics, the mystery as to what fundamental principle still separated the two main parties, continued to deepen. Three by-elections in June did nothing to illuminate it, the relative strengths of government and opposition remaining exactly as before. In the national rather than the party political sphere, it was announced that the republic would hold firmly to the policy of remaining outside NATO (the North Atlantic Treaty organization) while partition lasted; and there was colourful pageantry in Dublin in June when Sean T. O'Kelly was formally inaugurated president. Nationalist members of parliament and senators from the six counties attended the ceremony. His nomination for another seven-year term as president was unopposed.

July saw the ending of all food rationing in the republic. The items that came off the ration were bread, flour, sugar, tea and butter. At the same time subsidies on sugar, tea and butter were withdrawn altogether; those on flour and bread reduced. Starting July 11, Dublin printers began a strike that left both the capital and a wide area throughout the country without newspapers for seven weeks.

The rapid expansion of the Irish trade in meat continued. Many new meat-processing factories were registered. It was claimed that one in Dublin would be the largest of its kind in Europe. Its first products were chilled beef for Great Britain and the United States. The U.S. department of agriculture reported that Ireland was shipping more refrigerated meat to the United States than was any other country. One reason for this phenomenal development was Ireland's freedom from foot-and-mouth disease. Although the Irish refrigerated meat trade was only two years old, it earned during 1952 twice as many dollars as all other 26 county exports combined.

The adverse trade balance for the first nine months of 1952 was £57,396,000, or £39,819,000 below that for the same period in 1951. Imports for the nine months were valued at £129,628,000 compared with £149,890,000 for the corresponding period of the previous year. An interesting trend developed in August, when, for the first time, exports to Britain exceeded imports from Britain, mainly due to increased food exports. There was also a favourable balance of £975,000 with Northern Ireland. There was, however, a heavy adverse balance with the dollar area for August, amounting to £1,491,000. In spite of encouraging trade statistics and financial returns, the printing strike, a hold-up in the port of Dublin, and a threatened strike of building operatives were all symptoms of uneasiness in the industrial system. The cause was not difficult to locate—as witness a rise in the interim cost-of-living index figure of 18% since Feb. 1951.

At the same time there was a growing threat of redundancy in leading national undertakings, particularly in transport, and an increase in unemployment.

The republic's main industry, agriculture, had a prosperous year. The harvest was one of the best for half a century. Enough barley and oats were grown to meet all demands for feeding stuffs and yet left a margin to induce an increase in the number of livestock carried on farms during the winter.

Arrangements were begun for *An Tostal*, Ireland's national festival, which was planned for April 1953 and was preparing to rival the glories of Edinburgh. Appropriately, at the same time as festival plans began to take shape, Aer Lingus, the Irish national air line, reported a record profit of more than £92,000 for the year ended March 31, 1952. Passenger traffic provided the bulk of the earnings, but cargo traffic also increased by 33%. The first considerable ship launching for 15 years (a steel-hulled vessel of 1,100 tons) took place in a Dublin shipyard.

A special postage stamp was issued to commemorate the 100th anniversary of the death of the Irish poet and musician Thomas Moore.

(D. L. I.)

Education.—Schools (1949–50): elementary 4,896, pupils 445,183, teachers 12,821; secondary 416, pupils 47,065. Universities 2 (the National university has 3 constituent colleges), students 7,448, professors and lecturers 499.

Finance and Banking.—Budget: (1951–52 est.) revenue £80,500,000, expenditure £81,600,000; (1952–53 est.) revenue £86,600,000, expenditure £101,700,000. National debt (March 1950) £130,600,000. Currency circulation (July 1952) £62,100,000. Bank deposits (quarterly average, July–Sept. 1952) £257,700,000. Gold and foreign exchange (Sept. 1952) U.S. \$200,000,000. Monetary unit: Irish pound at par with the pound sterling.

Foreign Trade.—(1951) Imports £204,500,000, exports £81,400,000. Main sources of imports (1951): Great Britain 47%; U.S. 13%. Main destinations of exports: Great Britain 84%; U.S. 4%. Main imports (1951): machinery and vehicles 14%; textiles and manufactures 13%; wheat and corn 7%; coal 6%. Main exports: live animals 36%; meat, fish and dairy products 23%. Index of volume of trade (on basis of 1948=100, 1951), imports 117; exports 135.

Transport and Communications.—Roads (1950): 49,170 mi. Licensed motor vehicles (Dec. 1950): cars 85,140, commercial 40,748. Railways, two principal railways including cross-border operations (1950): 2,460 mi.; passengers carried 21,000,000; freight carried 4,476,000 metric tons; freight, ton-miles 327,000,000. Air transport (1950): passenger-miles 50,000,000; cargo, ton-miles 495,000. Inland waterways: 566 mi. Telephones (1951): 82,031. Radio receiving sets (1950): 296,388.

Agriculture and Fisheries.—Main crops (metric tons, 1951): wheat 252,000; oats 580,000; barley 170,000; rye 3,000; potatoes 2,810,000; sugar, raw value 99,000; flax fibre (1950) 1,400. Livestock (1951): cattle 4,381,000; sheep 2,702,000; pigs 548,000; goats 50,000; horses (1949) 402,000; mules (1949) 5,000; poultry 18,570,000. Wool production (clean basis, 1951) 4,000 metric tons. Food production (metric tons, 1951): meat 153,000, of which beef and veal 81,000, pork 58,000; butter from co-operative creameries 33,100; cheese 2,500. Fisheries (wet fish, 1951): 13,981 metric tons.

Industry.—Persons employed in industrial establishments (1948) 197,550. Fuel and power (1951): coal 184,800 metric tons; electricity 1,008,000,000 kw.hr.; manufactured gas 166,800,000 cu.m. New houses constructed under state aid (1951) 12,132. Index of industrial production (1951, 1948=100): 132.

Iron and Steel. For convenience in coverage, this subject is divided into its three major parts: iron ore, pig iron and steel. Production statistics are those from the major producing countries available in Nov. 1952, as reported by the U.S. bureau of mines.

Iron Ore.—World production, as shown in Table I, had been increasing to meet growing demands. A material share of the larger outputs of Canada, Brazil, Chile and Sweden was used to supplement the United States output. The outputs of new developments in Labrador and Venezuela were also expected to add to the United States supply.

The salient statistics of iron ore in the United States are shown in Table II. The sharp upward trend in imports is particularly significant, the proportion having grown from 2% of consumption in 1946 to more than 11% in 1951.

Production during 1951 was reduced by the shutdown during the steel strike; through May, however, the total was practically the same as in the corresponding period of 1951.

Pig Iron.—Table III includes the pig iron and ferroalloy outputs of countries having annual outputs of 1,000,000 tons or more. In the United States, the 1951 output advanced about 19% over 1950, but was cut back sharply by the steel strike to a total of 42,494,940 tons through Sept. 1952, or 19% less than the same period of 1951.

STEEL PRODUCTION in the United States, 1929-52 (11 mo. for 1952); monthly average percentage of capacity (figures compiled by American Iron and Steel Institute)

STRIKING STEEL WORKERS setting up a makeshift headquarters at the Youngstown, O., plant of U.S. Steel in June 1952, immediately after the supreme court ruled against President Truman's seizure of the steel industry

Steel.—Table V lists the countries with steel outputs in excess of 1,000,000 tons a year.

After a record output in 1951—the first year in which U.S. steel production exceeded 100,000,000 tons—and after an advance of 9% over 1951, the 1952 output was sharply reduced by a strike in the industry which cut the normal June and July figures by more than 80% and gave a total of 64,192,392 tons in the first three quarters, a decline of 18% from the same period of 1951.

It was estimated that the strike caused a loss of almost 20,000,000 tons in the 1952 production, only a fraction of which

could be made up by pushing the operation rate during the last quarter of the year. (G. A. Ro.)

Iron and Steel Institute, American: see SOCIETIES AND ASSOCIATIONS, U.S.

Irrigation. United States.—Winter snowfall of record-breaking proportions relieved the water shortages in the southwest early in 1952. The Arizona drought was broken, irrigation supplies being plentiful except in Gila valley where some late crops lacked sufficient water. Reservoir storage was built up for the Salt and Verde river systems, but San Carlos project storage was only 3% of reservoir capacity at the end of the summer rainy season. With this principal exception, year-end prospects for carry-overs were favourable throughout the mountain and Pacific states. Even Elephant Butte reservoir, New Mexico, which belatedly showed the effects of mountain snow-melt, promised to hold almost 500,000 ac.-ft. more than at the beginning of the 1952 withdrawal season. Shasta reservoir, California, filled for the first time; water behind Hoover dam on the Colorado river increased by about 3,500,000 ac.-ft., and that behind Grand Coulee dam, Washington, by about 1,000,000 ac.-ft. All 129 bureau of reclamation reservoirs held a record supply of more than 51,000,000 ac.-ft. on Aug. 1. However, in southern Texas a protracted summer drought caused heavy crop damage.

Skilful manipulation of storages preceding and during heavy runoffs averted floods except, notably, in Utah, the San Joaquin valley of California, and the Milk river valley in Montana. Ideal snow-melt weather helped this control, permitting regulation of streams despite the saturated soil of tributary areas. Flood damage was severe on about 1,700 Utah farms containing approximately 33,500 cropland acres, and rehabilitation of these lands and their irrigation facilities was expected to cost more than \$1,000,000. About 65,000 ac. in Tulare lake basin, California, were inundated and crops on about 10,000 ac. elsewhere in San Joaquin valley were damaged, but the damage to irrigation systems was not extreme. Ground storage was benefitted in all important pumping sections, both by postponement of pumping and by direct replenishment, but full replenishment were not looked for immediately.

Firmed water supplies and good prices for crops led to a general increase of the irrigated acreage. The federal bureau of reclamation was the principal large-scale construction agency expanding the area wholly and partly served by its systems to about 6,593,000 ac. A further increase to 6,750,000 ac. was planned for 1953, together with facilities for production of 352,500 kw. of new hydroelectric power. Ten new projects were involved in this program: Sly Park unit, Central Valley project, California; Solano project, California; North Side pumping division, Minidoka project, Idaho; Savage Rapids dam, Oregon; Weber Basin project, Utah; Kennewick division, Yakima project, Washington; and the Rapid Valley unit, Lower Marias unit, Missouri Diversion unit and Webster unit in the Missouri River Basin project.

The bureau celebrated delivery of water from Lake Franklin D. Roosevelt to arid lands of the Columbia Basin project, Washington. Portions of 920 farm units averaging 90 ac. received this service. Construction features of this project, begun in 1935, were brought to three-fifths completion. Also celebrated was the initial operation of generators with hydroelectric capacity of 142,500 kw. at the Hungry Horse water and power project in Montana, as well as 230,000 kw. of capacity at Hoover (Arizona-Nevada) and Boysen (Wyoming) dams.

Irrigated acreages reported by the bureau were greatly more than those shown for it in revised tabulations of the 1950 federal census of irrigation, the census figures not crediting the bureau with projects taken over for operation by the water users. A breakdown of the totals for the 17 western states, by type of operating enterprise, follows: single-farm, 11,817,059 ac.; unincorporated mutuals, 2,113,642; incorporated mutuals, 5,635,630; commercials (mostly public utilities), 705,087; irrigation districts, 4,962,413; bureau of reclamation, 682,413; U.S. bureau of Indian affairs, 506,076; states, 51,782; cities, 56,845.

Other census figures showed marked advances of irrigation in eastern states. Previously unannounced 1949 irrigated acreages for Arkansas, Florida and Louisiana were 422,107, 365,421 and 576,775. Other unexpectedly large totals were: New Jersey, 28,117; New York, 19,248; Wisconsin, 9,781; Connecticut, 8,088; Pennsylvania, 7,251; South Carolina, 6,408; Ohio, 5,706; Indiana, 5,339; Mississippi, 5,086; Minnesota, 4,235. In continental United States 305,061 farms reported 25,787,455 ac. as irrigated.

California took the first steps in its state-sponsored Feather River project by letting contracts for surveys of canal routes and dam sites. The state legislature appropriated \$10,000,000 for a token payment to the bureau of reclamation in a proposed purchase of the Central Valley project, on which, however, no agreement was reached.

Egypt.—Two programs were being considered in Egypt. A short-term plan contemplated reclamation, by new canals, of 40-

Turkey.—A third loan was made by the International Bank involving \$25,200,000 for the development of Adana plain in south-central Turkey by helping finance a multipurpose dam and power facilities as a key part of the government plan for full utilization of the Seyhan river. The full cost would be about \$35,800,000. The loan would finance purchase of machinery; other parts of the plan would be financed by the Turkish government. Irrigation would be provided for about 356,000 ac. The completion of the dam was scheduled for the summer of 1956, and the completion of the irrigation system would be in 1961. The cost of the entire program would be \$67,000,000. Irrigation would increase production of cotton, oil seeds and citrus fruits. (*See also* AQUEDUCTS; DAMS; FLOODS AND FLOOD CONTROL; SOIL EROSION AND SOIL CONSERVATION.) (P. A. E.)

In Egypt education was greatly affected by political strikes connected with the conflict with the British in the Suez Canal Zone in which students took part. Several lives were lost. Events of cultural importance were the opening of the two new universities and the appointment of a new rector of the el-Azhar university. In the Anglo-Egyptian Sudan, the nationalists, who supported union with Egypt and who had opened 19 primary

MOSLEM PILGRIMS ready to board a fleet of U.S.A.F planes flown to Beirut, Leb., as a gesture of friendship when almost 4,000 pilgrims were stranded there without transport on their holy journey to Mecca in the fall of 1952

schools and 38 schools for adult education between 1940 and 1945, continued to press for better facilities for both elementary and higher education. They complained that whereas the Egyptian government had provided free education for 2,000 to 3,000 university students from the Sudan each year, the Sudanese government itself was doing nothing.

Jordan devoted 5.3% of its budget (*i.e.*, 302,574 dinars) to education. A proportionately large number of Jordanian students were educated abroad, chiefly in Egypt and Lebanon; also 179 were taking courses in the United States. The Syrian and Lebanese governments made determined efforts to remove illiteracy. In Lebanon literacy was said to be as high as 85% (nearly 50% of the population is Moslem). In Yemen, where modern education had been introduced only in 1946, a Lebanese mission arrived, and Yemenites who had achieved a higher educational standard were sent to gain experience with other Arab governments; students went mostly to Egypt.

According to the 1951 Pakistan census 10,374,000 (13.8% of the population) were literate. A six-year education plan was worked out, and it was envisaged that illiteracy would be wiped out within 20 years. The Pakistan government decided to establish during the next five years 11 technical high schools similar to that opened in Karachi in July 1951. In that city was laid the foundation stone of the Women's College of Domestic Science,

founded under the auspices of the All-Pakistan Women's association. The Ford foundation granted Rs. 1,660,000 toward the cost of the building. At Lahore from March 29 to April 2 the association itself held its annual conference, which was attended by 500 delegates including those from Persia, Iraq, Egypt, Turkey, Indonesia, Lebanon and England. Another conference of far-reaching cultural importance was the Congress of the Divines of Islam (Intifal Ulama al-Islam) which met in Karachi from Feb. 16 to Feb. 18, 1952, and whose aim was to draw up a practical program for the dissemination of Islamic ideals. The congress was attended by 43 religious leaders from Pakistan, Afghanistan, Egypt, Indonesia, Syria, Saudi Arabia, Kashmir, India, Algeria and Ceylon. The Iraqi government commemorated the ninth centenary (reckoned in Moslem hegeric years) of the death of the Moslem natural philosopher and physician Avicenna (d. A.D. 1037). The Arab league at its session of Sept. 16 decided to establish an institute of higher Arab studies. (See also AVIATION, MILITARY.)

Isle of Man: see COMMONWEALTH OF NATIONS; GREAT BRITAIN & NORTHERN IRELAND, UNITED KINGDOM OF.

Ismay, Hastings Lionel Ismay, 1ST BARON, of Wormington, Gloucestershire (1887–), British soldier, was born in India, June 21. He was educated at Charterhouse and Sandhurst and was com-

missioned in 1905. He served on the northwest frontier, India, and, during World War I, in Somaliland. He attended the Staff College, Quetta, in 1922, and during 1926-30 was assistant secretary to the Committee of Imperial Defence. Later, 1935-36, he again served on this committee. He was knighted in 1940 and from then until 1946 (when he resigned) he was chief of staff to the minister of defense and deputy military secretary to the war cabinet. He accompanied Winston Churchill on many missions abroad as chief of staff in World War II. He returned to India as chief of staff to Earl Mountbatten of Burma, the last viceroy of India, in 1947, and in the same year he was raised to the peerage. Lord Ismay was chairman of the council of the Festival of Britain, 1951. When the Conservatives were returned to power in Oct. 1951 he received his first political appointment: secretary of state for commonwealth relations in Winston Churchill's cabinet. He took part in the Washington discussions in Jan. 1952 between Churchill and Pres. Harry S. Truman. On March 12 it was announced that Lord Ismay had accepted the post of secretary-general of the North Atlantic Treaty organization and would also be vice-chairman of the North Atlantic Treaty council. He resigned from his position as secretary of state for commonwealth relations and took up his new post on April 4.

Israel. Israel is a republic, proclaimed on May 14, 1948, at Tel Aviv, bounded north by Lebanon, east by Syria and Jordan, south by Egypt and west by the Mediterranean sea. Area: 8,084 sq.mi. Pop.: (Nov. 1948 census) 782,000, including 13,000 Jews; (mid-1952 est.) 1,605,000, including 1,430,000 Jews. Religion: mainly Jewish, but by 1952 there were 120,000 Moslems, 16,000 Druzes and 40,000 Christians. Chief towns (pop., 1951 est.): Jerusalem (*q.v.*) (cap., Israeli part only, 150,000); Jaffa-Tel Aviv (370,000); Haifa (190,000). President of the republic, Chaim Weizmann, until Nov. 9, 1952; from Dec. 10, Isaac Ben-Zvi. Prime minister, David Ben-Gurion.

History.—The year 1952 was one of consolidation, in which Israel was able to achieve progress in a number of spheres and was less troubled by either internal discords or external threats than it had been during any similar period since the nation proclaimed its independence. The enormous adverse trade balance, which was the primary cause of the country's economic malaise and which stood at IL107,000,000 for 1951 (imports IL123,000,000; exports IL16,000,000), was slightly reduced during the first six months of 1952, while the high rate of immigration, which was largely responsible for the adverse trade balance, was reduced from the record figure of 174,000 in 1951 (an average of 14,600 a month) to 17,500 for the first eight months of 1952 (an average of 1,458 a month). At the same time, great strides were made in increasing both agricultural and industrial production. Although Israel's relations with the countries of the Arab league showed no improvement, and it was unable to make headway in its approaches to the U.S.S.R., its ties with the Western powers became stronger and the signing of a reparations agreement with the Federal Republic of Germany at Luxembourg on Sept. 10 was a notable achievement which was expected to have an important effect on the country's economy.

Negotiations with the Federal German authorities were begun unofficially during 1951, but the subject did not come up for debate in the *knesset* (parliament) until Jan. 7 when the right-wing Cherut (Freedom) party seized the occasion to organize demonstrations against the government on the grounds that it was dishonourable for Jews to negotiate with the Germans and to accept monetary reparations as a token of repentance for the wrongs inflicted by the nazis. There was rioting

outside the *knesset* and some casualties, but the government, supported by the overwhelming majority of the people, stood firm and the negotiations were finally brought to a satisfactory conclusion. The Germans agreed to pay Israel 3,000,000,000 DM. and, in addition, 450,000,000 DM. for the specific use of Jewish organizations outside Israel. The payments were to be made in the form of goods to be delivered over a period of 12 to 14 years. It was expected that this agreement, which came into effect on signature, would tend to reduce the inflationary pressure and help to create higher agricultural and industrial productivity.

Despite various encouraging symptoms the economic state of the country continued to be serious and the government was obliged to introduce drastic measures. On Feb. 13, Ben-Gurion, the prime minister, announced evaluation of the Israel pound with three different rates of exchange (*viz.*, \$2.80, \$1.40, \$1.00=IL.1) which were applicable to different categories of imported goods and services. Steps were also taken to curb inflation, encourage foreign investment and stimulate exports. On June 8, Eliezer Kaplan, the finance minister, announced further strong antiblack-market and anti-inflationary measures which consisted of the withdrawal of high denomination banknotes and the establishment of a compulsory loan raised from bank accounts. The cost-of-living index in July was 157, compared with 100 in Sept. 1951, and in August the black-market rate of exchange stood around IL.1=33 U.S. cents. Apart from the continuous flow of financial assistance received from Jewish communities abroad, Israel secured, on Feb. 27, a grant-in-aid from the United States of \$50,000,000. A request for a loan of £5,000,000 from the United Kingdom for the purchase of oil was, however, refused in an announcement in the house of commons made on May 20 by Winston Churchill. Two significant industrial developments were: on May 4 the signature of an agreement between the government and a Belgian company for the exploitation of copper ore deposits in the Negev area and, on July 24, the conversion of Palestine Potash, Ltd., into Dead Sea Works, Ltd., an enterprise in which the Israeli government secured 51% of the voting rights.

The passage by the *knesset* on April 1 of the Nationality bill, which automatically conferred citizenship on Jewish residents, was the signal for strong protests by the Arab minority which considered that it was being subjected to discrimination. A more serious threat to the stability of Ben-Gurion's coalition was provided by the resignation, on Sept. 18, of two Agudist (Jewish Orthodox) members of the government because of differences of opinion about the conscription of women into the armed forces and the unification of education.

Israel watched with close attention the developments in the neighbouring Arab states, but there was no relaxation in the "cold war" or the economic boycott imposed against it. On June 8 it was admitted that negotiations concerning frontier amendments had been held with Jordan and, soon after Maj. Gen. Mohammed Naguib achieved power in Egypt, Ben-Gurion, in a speech on Aug. 18, made friendly overtures in the hope of establishing peace between the two countries. Israel's sense of insecurity remained such, however, that the period of compulsory military service was extended, on Aug. 19, from 24 to 30 months.

The decision of the government, announced on May 4, to move the ministry of foreign affairs from Tel Aviv to the capital, Jerusalem, met with the disapproval of a number of countries. Nevertheless, both the British and French governments decided in August to raise the status of their respective legations to that of embassies, a compliment which was reciprocated by Israel. Chaim Weizmann, first president of Israel and world renowned chemist, died of a heart attack Nov. 9. Weizmann had been a principal force in the creation of the Israeli state. Josef Sprinzak, house speaker, assumed the duties of the presidency.

On Dec. 8 Isaac Ben-Zvi, Mapai (Labour party) candidate, was elected second president of the republic. He was invested in Jerusalem on Dec. 10. (See also IMMIGRATION AND EMIGRATION.) (D. F. K.)

Education.—Government schools (1951-52): kindergarten 1,547, pupils 59,625, teachers (1950-51) 1,415; elementary 825, pupils 178,174, teachers (1950-51) 6,201; secondary 68, pupils 12,751, teachers (1950-51) 859; agricultural schools 28, pupils 4,925, teachers (1950-51) 346; Arab 192, pupils 27,151, teachers 708. Nongovernment (Jewish religious) schools: primary 20, pupils 2,475; secondary 115, pupils 4,862. Government teachers' training colleges: 17. Other institutions of higher education 3, students 4,054, professors and lecturers 175. Hebrew University of Jerusalem (1952-53): students c. 3,000; professors and lecturers c. 300.

Finance and Banking.—Budget (1951-52) balanced at IL.198,600,000; (1952-53) balanced at IL.283,400,000 (incl. development IL.115,000,000, defense IL.45,000,000). Currency circulation (June 1952): IL.115,500,000. Bank deposits (March 1952): IL.262,544,048. Monetary unit: Israeli pound, divided into 1,000 pruthoth. There are three legal rates of exchange in operation: IL.1 = £1 sterling; IL.2 = £1 sterling; IL.2.800 = £1 sterling.

Foreign Trade.—(1951) Imports IL.122,500,000; exports IL.16,700,000. Main sources of imports (1951): U.S. 31.8%; U.K. 10%; France 5%. Main destinations of exports: U.K. 32.6%; U.S. 22.9%; Finland 11%; Denmark 6%. Main imports: machinery, grain and flour, vehicles, iron and steel manufactures, fuel. Main exports: food, drink and manufactured goods.

Transport and Communications.—Roads (1952): 2,199 km. Licensed motor vehicles (March 1952): cars 10,753, commercial vehicles 15,206. Railways (1951-52): 535 km.; goods, 251,523 ton-kilometres; freight carried, 947,809 metric tons. Shipping (1952): merchant vessels 30; total tonnage 150,000. Air transport (1951): 183,525,758 passenger-kilometres. Telephones (1951): 28,956. Radio receiving set licences (1951): 149,582.

Agriculture and Fisheries.—Main crops (metric tons 1950-51): wheat 13,500; barley 27,500; maize and durra (1949-50) 19,900; maize and sorghum 4,000; oats 1,200; potatoes 37,000; oilseeds 7,000; grapes 13,400; olives 2,700; deciduous fruit 3,500; bananas 5,700; other fruit (metric tons, 1951): oranges and tangerines 258,000, grapefruit 54,000, lemons 8,000. Wine production (1950-51) 7,400 l. Livestock: cattle (1950) 60,000; sheep (1951) 55,000; chickens (1951) 788,000. Fisheries, total catch (1951): 1,397,502 kg.; value IL.3,165,935.

Industry.—Electricity sales (1951) 558,100 kw.hr. Manufactured goods (1951): cement 439,000 metric tons; margarine 5,000 tons; flour 105,424 tons; soap 6,968 tons; beer 12,288 l.; cigarettes 2,026,683 kg.

Italian Colonial Empire: see ERITREA; LIBYA; SOMALILAND, ITALIAN.

Italian Literature. Two outstanding literary events during 1952 had repercussions inside and outside Italy. The first was the prize and punishment received by Alberto Moravia, a non-Communist writer. Within the space of a few weeks, all his works were placed on the *Index Librorum prohibitorum*, he accepted an invitation by the state department to go to the United States only to have it revoked without explanation, and shortly thereafter he received the coveted Strega prize for his *I racconti* (Bompiani, Milan), a complete and definitive collection of his short stories, told with consummate artistry and containing his best writings. The second was the return of Ignazio Silone to the field of letters, following his return from exile and a long leave of absence spent in Italian politics, with the publication of *Una manciata di more* (Mondadori, Milan), a novel which takes the reader back to the peasants of Fontamara who relate with their native humanity, pathos, imagery and humour what happened after the fall of fascism to them, to their land, to the fascist bosses and to a mysterious symbolic trumpet. It is a story of disappointment, sacrifice, resignation and yet of faith in a better tomorrow.

From a general survey of the Italian prose published during the year it appears that the most favoured themes were the travails of the intellectual, the land problem, the plight of the have-nots, the spiritual crisis of youth under the impact of recent political and social events, and lastly, the never-ending search in that labyrinth which is the soul of woman.

A novel, which for both content and intent recalls G. A. Borgese's *Rubè*, was Carlo Cassola's *Fausto e Anna* (Einaudi, Turin). Spanning that period of Italian life between the Ethiopian war and the liberation of Italy, it had as its protagonist a young intellectual in futile search of a purpose in life, an

ideal, a faith, until the part he plays in the war of liberation reveals to him that only by working for others and with others can life become worth living. In the same vein, though not of the same plane, was Arnaldo Frateili's *Controvento* (Bompiani, Milan), in which a wealthy, materialistic and dissolute businessman emerges from the maelstrom of war with a new awareness of inner virtue and a newly kindled love of mankind which prompt him to seek and live a kind of franciscan life.

Fortunato Seminara published two novels dealing with the landowners and peasants of his native Calabria and their deep attachment to the land: *La masseria* (Garzanti, Milan), and *Il vento nell'uliveto* (Einaudi, Turin). In the first, there is introduced a shrewd landowner who manages throughout the social upheavals of the post-World War II period to save his land from the masses of poverty-stricken peasants whose progress is arrested by superstition, hide-bound tradition and misery. The second concerns the trials of a young seminarist who, upon inheriting a farm, decides to devote himself to the welfare of his famished peasants only to see his efforts come to naught in the end through the devastations of nature and the elements. Still related to the land but treating a different problem is R. M. de Angelis' *La brutta bestia* (Mondadori, Milan), which analyzes the social conflict arising out of the love of a young widowed landowner for a peasant, their subsequent marriage and disillusionment.

The endemic problem of overpopulation and the economic crisis which had induced an unusually large number of young Italians to enter the priesthood, absorbed Libero de Libero. In *Camera scura* (Garzanti, Milan) he related with urbane and sagacious penetration, the experiences of a poor lad who enters a seminary as a way of pursuing his studies but who, after a long struggle with his conscience, finally is forced to leave.

The social, moral and psychological problems besetting the fair sex occupied a score of women writers. Noteworthy among them were Anna Banti, co-winner of the second Viareggio prize, who produced four brilliant and incisive full-length portraits of women in *Le donne muoiono* (Mondadori, Milan); Pia d'Alessandria, with a distinguished novel, *Autunno con le ragazze* (Rizzoli, Milan), that dissects parent-daughter relations in the unusual milieu of army officers' families; Elda Rossi, who contributed a volume of short stories (*I poveri*, Rizzoli, Milan, Venezia prize) containing ten admirably restrained and balanced studies of humble creatures, the majority of them women; Anna di Meo whose *Posta aerea* (Guanda, Parma) is the confession of a woman who tells her love, in an outburst of joy and relief to the man who cannot love her; and Emilia Gardona whose *La belle di Villa Borghese* (Guarnati, Milan) is a story of the rivalry and hatred of two sisters as told by the victim, confined in an insane asylum, who traces through her own life the customs, dreams, loves and follies of the social set to which she had belonged.

Aldo Palazzeschi, weary of writing about man, his virtues, foibles and vices, turned to animals who became the protagonists of a charming volume of short stories (*Bestie del '900*, Vallecchi, Florence) which are small masterpieces of fantasy, wisdom and humour. Giuseppe Marotta published another of his literary mosaics, *Gli alunni del sole* (Bompiani, Milan), consisting of legends of the Greek pagan world as seen through the rich imagination of a retired Neapolitan janitor who narrates them with gusto and conviction to his spellbound friends.

Two books by nonprofessional writers were the focus of wide attention and critical praise: *Mezzo contadino* (Neri-Pozza, Venice) by Gilberto Rossi, a noted scientist, who makes his debut on the literary scene with a limpid, poetic and warmly human account of the salient episodes of his youth; and *Ultime lettere di condannati a morte della Resistenza italiana* (Einaudi,

(Turin), a collection of last letters written by men and women of the Italian resistance—intellectuals, workers and peasants—to friends and relatives before facing the firing squad. The collection constitutes an impressive monument to the cause of freedom and human dignity. (M. F. C.)

Italy. A republic of southern Europe, Italy is bounded on land northwest by France, north by Switzerland and Austria and northeast by Yugoslavia. The country includes not only the whole of the Apennine peninsula, but also the large Mediterranean islands of Sicily and Sardinia and a number of smaller islands. Area: 116,224 sq.mi., excluding Venezia Giulia, Zara and the islands (2,843 sq.mi.) ceded to Yugoslavia, the five small areas in the Alps ceded to France (273 sq.mi.) and the Free Territory of Trieste. Pop.: (1951 census, prelim.) 47,220,536. Language: mainly Italian, but in Venezia Tridentina there were about 210,000 German-speaking Tyrolese, and about 10,000 Romansch-speaking Ladins; in the area east of Udine there were about 11,200 Slovenes and the population of Val d'Aosta (about 6,600) was French-speaking. Religion: mainly Roman Catholic (99.6%). Chief towns (pop. 1951 census): Rome (cap., 1,695,477); Milan (1,292,934); Naples (1,027,000); Turin (720,032); Genoa (683,023); Palermo (501,005); Florence (390,832); Bologna (349,326); Venice (323,216); Catania (300,298); Bari (273,143); Messina (220,790). President, Luigi Einaudi; prime minister, Alcide de Gasperi (*q.v.*).

History.—The political history of Italy during the first half of 1952 was dominated by the third round of local elections which took place on May 25. The anti-Communist Socialists held a congress which opened at Bologna on Jan. 3 at which frantic efforts were made to consolidate their position; after tempestuous meetings, they renamed themselves the Social Democratic Party of Italy (P.S.D.I.). Many of their members hoped for a Socialist reunion with the pro-Communist Socialist party, and there was little doubt that Pietro Nenni himself would have been willing to move a little away from the Communists in order to achieve this. Later, in July, he went to Moscow to receive a Stalin peace prize, and on his return insisted as ever upon the mediation between west and east which he regarded as his task.

In April Don Luigi Sturzo, who had once led a leftist Catholic party called the Popolari, came out with an appeal for a united front against the Communists. Sturzo was backed, indeed to some extent instigated, by Professor Luigi Gedda, the right-wing leader of the Catholic Action. For this reason, perhaps, Sturzo drew back at the last moment; the Vatican, also, seemed to change its attitude from one of support of Gedda (who wished to co-operate with monarchists and neofascists) back to support of the more moderate policy of De Gasperi. In Rome the fellow-travelling alignment of the veteran radical, Francesco Saverio Nitti, with the Communists and Nenni Socialists caused some consternation, but when it came to polling day the Christian Democrats with their allies retained control of the capital. In Naples there was a 43% vote for the monarchists whose new president, the millionaire shipowner, Achille Lauro, had led a conspicuous campaign; he was subsequently elected mayor of Naples. The monarchists and neofascists had formed a series of alliances and together they won control of other southern towns such as Bari and Foggia, while the Communists remained masters of Ferrara and Aosta in the north.

Parties	Votes	%	
Christian Democrats . . .	8,021,933	36	Combined centre 11,173,487 or 50%
Social Democrats	1,699,571	7.6	
Liberals	880,286	3.9	
Republicans	571,697	2.5	Combined left 7,482,748 or 33.5%
Communists	4,594,489	20.5	
Nenni Socialists	2,888,259	13	
Neofascists	1,419,741	6.3	Combined right 2,224,547 or 9.9%
Monarchists	804,806	3.6	

ITALIAN COAL MINERS working in cramped galleries on the island of Sardinia in 1952. Conditions were slowly being improved as funds became available for the purchase of underground machinery

The combined results of the provincial elections held in 1951 and 1952 in all Italy (except for the autonomous regions of Sicily, the Alto Adige and the Val d'Aosta) were announced to be as shown in the table.

About 7% of the electorate voted for other very small parties. Compared with the parliamentary elections of April 18, 1948, the centre parties, Christian Democrats in particular but not the Liberals, had lost, while the extremists on the left and more emphatically on the right had gained; the combined centre had nevertheless managed to poll exactly half the total number of votes. On the right, monarchists and neofascists had each won more than 160,000 fresh votes; while the former had triumphed in Naples, the latter had made their biggest gains in Rome. Finally the local elections had accentuated the difference between the leftist north and rightist south of Italy.

The second half of the year, broadly speaking, was devoted to manoeuvring for position in preparation for the parliamentary elections due in the spring of 1953. Everything depended upon the electoral law which would prevail at the time and which must now be determined. The centre parties wished to apply the same regulations as those which had governed the local elections, that was, to sanction the linking of party lists and in the future parliament to give an additional premium of seats to the most successful party in order that it should be able to govern with a working majority. Further, the centre parties for long meditated legislation to prevent the extremists of the left and of the right from exploiting constitutional liberties such as those of the freedom of the press and the right to strike.

On June 18, after lengthy debates, a law against the reconstitution of fascism was passed. This helped to restrain the ardour of the national congress of the neofascist *Movimento*

Sociale Italiano (M.S.I.), which was allowed to meet on June 26 at Aquila in the Abruzzi. There the party's secretary general, Count Alberto de Marsanich, succeeded in imposing the adoption of a relatively moderate policy to be based upon a corporative economy at home and halfway acceptance of NATO, but with an avowed preference for Spain over Great Britain in the company of Italy's allies. Antifascists, however, continued to regard future developments with apprehension since the ban upon the political activities of former fascist leaders was due to expire at the end of the year. Rodolfo Graziani and Filippo Anfuso were already members of the M.S.I., while Dino Grandi and Giuseppe Bottai seemed to be holding back.

Against Anfuso, De Gasperi launched a telling attack in a speech at Predazzo on Aug. 31 with which he was considered to have launched his political campaign leading up to the elections in the spring. His general line was to appeal to all moderate opinion against the two extremes. After the losses on May 25 his own party pressed for ministerial change; it was known that the prime minister wished to reinstate representatives of the Liberals and Social Democrats. When the Italian chambers reassembled at the end of September a new version of the monarchists called the Italian Democratic party, sponsored by Vincenzo Selvaggi and Guglielmo Giannini (formerly leader of the Common Man party), put in its claim to a place in the government coalition. Meanwhile the Communists threatened to fight the proposed electoral reform by initiating a referendum to condemn it as unconstitutional; to bring about a referendum they needed 500,000 signatures which they could easily collect.

Before the end of 1951, 11 of the 21 signatories of the Italian peace treaty had expressed their willingness for its revision and early in 1952 all but the Communist countries fell into line. The practical results were that from the beginning

of 1952 the restrictions upon Italy's armaments were a dead letter and Italy became an active member of the various western European organizations. De Gasperi himself attended the meeting of the Council of Europe at Strasbourg in September; later in the month he visited Konrad Adenauer at Bonn before receiving the Charlemagne prize for service to peace (third award) at Aachen. Meanwhile the difficulty between Italy and Yugoslavia over Trieste remained insoluble (*see TRIESTE*).

There was considerable argument during the year between Italy and the United States, the Italians pressing for larger U.S. orders with Italian industry and for what they regarded as adequate aid toward the rearmament of Italy; on Sept. 12 \$40,000,000 was suggested as the first Mutual Security Aid allocation to Italy for 1952-53. The increase in U.S. duties on cheese, almonds, olive oil and hats was something of a blow to Italy and provided fuel for the leftist "anti-Atlantic" campaign. As for rearmament, the Italians reported to NATO on Sept. 16 that of the 12 divisions that Italy was to have had ready, three infantry divisions, one armoured brigade and one Alpine division were fully trained and equipped; by the end of 1952 one more in each category was ready while the air force had reached well over 350 first-line aircraft.

During 1952 Italian industrial production increased very slightly. The fact was that as a result of the slump in textiles, the manufacturing industries actually produced less. Yet there were important developments of a different kind which promised great things for the future. Boring for oil and methane or wet gas continued with considerable success, and the distribution of the latter was extended. The production of methane rose to about 4,500,000 cu.m. a day, being about three times the amount of methane produced in Italy in 1950. On June 1 a 500,000,000-kw.hr. power plant burning natural gas was inaugurated by the premier at Tavazzano near Milan with a pipe line to serve Turin so that the Fiat works could be supplied before the end of August. On Sept. 4 Enrico Mattei, the president of the A.G.I.P. (the state company for oil boring) and of S.N.A.M. (the state company for gas development), signed an agreement guaranteeing the inclusion of Genoa in the gas network, and construction of a pipe line to Genoa began before the end of the year. Already sober judges expected within the foreseeable future the reduction of Italy's coal imports by four-fifths, involving a tremendous economy in foreign exchange. Just when the possibilities of the further extension of water power were coming to an end, it began to be replaced not only by gas but also by natural steam of volcanic origin, and during 1952 plans for an additional power plant based upon newly found steam jets were worked out. Meanwhile the methane was a direct contribution to the Italian chemical industry in addition to its value as fuel.

The year saw a good deal of fresh capital invested in industry especially in southern Italy where, for instance, a cement factory was founded at Avigliano near Potenza, a mechanical and chemical factory near Cosenza and a glass factory at Cagliari in Sardinia. This was, of course, part of the fruition of the national effort to grapple with the appallingly backward state of the south, an effort toward which U.S. aid had contributed.

Industrialization in southern Italy was complementary to agrarian reform in which considerable progress was made during the year. In particular the Sila plateau in Calabria, which a few years previously had been a dangerous wilderness from which torrential floods descended in the winter, was by the end of 1952 converted into a prosperous peasant colony with new villages and improved farming. By the end of July detailed plans had been worked out for the allocation of 712,000 ha. (or 20% of all large and medium-sized estates) to landless peasants all

MINIATURE RAIL LINES set up in the canals of Venice, It., to speed repair work in 1952. The network of sea water canals had been steadily undermining the foundations of Venetian buildings and architectural treasures which threatened to crumble unless rapidly bolstered

ver the country; in addition to the Sila, where allocations were year ahead, a good deal of land was redistributed in Apulia and the poor Maremma district of Tuscany.

In the middle of September President Einaudi appointed two greatly respected men to be senators, Don Sturzo and Umberto anotti Bianco, president of the Italian Red Cross and a distinguished scholar. (See also ERITREA; SOMALILAND, ITALIAN.)

(E. WI.)

Education.—Schools (1949–50): elementary 39,188, pupils 4,815,239, teachers 167,743; secondary 2,358, pupils 369,574 (boys 233,036, girls 16,538), teachers 40,891; technical secondary 954, pupils 144,130 (boys 5,253, girls 28,877), teachers 16,102; schools of art and academies music 103, pupils 12,080 (boys 8,554, girls 3,526), teachers 1,727; universities and institutions of higher education 27, students (1948–49) 17,978, lecturers 3,890.

Finance and Banking.—Budget: (1950–51 est.) revenue 1,227,000,000,000 lire, expenditure 1,397,000,000,000 lire; (1951–52 est.) revenue 1,455,000,000,000 lire, expenditure 1,824,000,000,000 lire. Internal national debt (Aug. 1951) 2,820,000,000,000 lire. Currency circulation (July 1952) 1,220,000,000,000 lire. Bank deposits (July 1952) 1,773,000,000,000 lire. Gold and foreign exchange (May 1952) U.S. \$960,000,000. Monetary unit: lira (pl. lire) with an exchange rate of 1,750 lire to the pound and 625 lire to the U.S. dollar.

Foreign Trade.—(1951): Imports 1,353,600,000 lire, exports 1,027,000,000 lire. Main sources of imports (1951): U.S. 21%; Germany 7%; K. 4%; Argentina 5%; France 5%. Main destinations of exports: K. 13%; Germany 8%; France 9%; U.S. 7%; Switzerland 6%. Main imports (July–Dec. 1951): raw cotton 11%; coal and coke 10%; petroleum and products 9%; wool 8%; grains and products 8%. Main exports: machinery and vehicles 16%; cotton yarn and fabrics 14%; fruits and vegetables 12%; artificial fibres and fabrics 12%; other textile goods and manufactures 11%.

Transport and Communications.—Roads (1950): 108,237 mi. Licensed motor vehicles (Dec. 1950): cars 342,021, commercial 229,277. Railways (1950): 13,449 mi., of which state railways 10,137 mi. Traffic on state railways (1950): passenger-miles 12,643,000,000; freight, ton-miles 24,400,000. Shipping: merchant vessels, 100 gross tons and over (July 51) 1,076; total tonnage 2,918,137. Air transport (1950): passenger-miles 94,300,000; cargo, ton-miles 1,900,000; mail, ton-miles 600,000. Telephones (1951): 1,244,152. Radio receiving set licences (1949): 543,000.

Agriculture.—Main crops (metric tons, 1951): wheat 6,904,000; maize 750,000; barley (1952) 258,000; oats (1952) 496,000; rye 122,000; potatoes 218,000; rice (1950) 690,000; sugar, raw value 669,000; dry beans 171,000; cotton, lint 5,000; cottonseed 9,000; flax fibre 4,300; seed 12,000; hemp fibre 65,100; rapeseed (1950) 11,000; peanuts 100; tobacco (1950) 67,000; olives 1,911,000; olive oil 160,000; oranges and tangerines (1950) 583,000; lemons, limes and other citrus fruits (1950) 300,000; grapes (1950) 5,990,000. Wine production (1951) 5,388,000 hl. Livestock (1950–51): cattle 8,325,000, sheep 10,386,000, pigs 4,052,000, horses 800,000, mules 390,000, goats 2,489,000, buffaloes (1949–50) 12,000. Livestock products (metric tons, 1949): wool, greasy 18,000; meat 612,000, including beef and veal 302,000 and pork 12,000; butter 56,000; cheese 237,000; eggs 4,550,000 (number). Fisheries, total catch (1950): 190,201 metric tons.

Industry.—Index numbers of employment in manufacturing, 1948=100 (1950) 147. Fuel and power (1951): coal 1,166,000 metric tons; lignite 3,000 metric tons; gas, natural 956,000,000 cu.m., manufactured 872,000,000 cu.m.; electricity 30,315,000,000 kw.hr.; crude oil 17,600 metric tons. Raw materials (metric tons, 1951): iron ore 514,000; pig iron 1,048,000; steel ingots and castings 3,050,000; lead, smelter 36,000; zinc, smelter 46,000; aluminum, smelter 49,800. Manufactured goods (metric tons, 1951): cement 5,580,000; cotton yarn 190,000; rayon garment yarn 65,100; rayon staple fibre 65,500; motor cars 131,000, commercial 16,000. Index numbers of industrial production (1948=100, 1951): general index 144; mining 124; manufacturing 147.

Ivory Coast: see FRENCH UNION; FRENCH WEST AFRICA.

Jamaica. A British colony and dependencies in the Caribbean sea. Dependencies: Cayman Islands (100 sq.mi.; pop. 1951, 7,000) and Turks and Caicos Islands (166 sq.mi.; pop. 7,000), with local legislatures. Area (colony): 4,411 sq.mi. Pop.: (1943 census) 1,237,063; (1951 est.) 1,430,000, mainly of African descent. Language: English. Religion: Christian, including (1943) Anglican 350,311, Presbyterian 92,975, Roman Catholic c. 70,000. Chief towns (pop. 1943 census): Kingston (cap., 201,911); Spanish Town (12,007), Montego Bay (11,547). Administration: governor; privy council, 4 ex officio and 2 nominated unofficial members; executive council, 1 ex officio, 2 nominated and 5 elected members; legislative council, 3 ex officio, 2 official and not less than 10 nominated unofficial members; house of representatives, 32 elected members. Governor in 1952, Sir Hugh Foot.

History.—Proposals for constitutional advances were out-

lined by the governor in his speech at the opening of the legislature in April 1952. His subsequent message to the house of representatives contained recommendations for the establishment of six separate ministries allotting executive functions to ministers. Two additional ministers would be without portfolios, giving the elected side a majority of three in the executive council. In accepting these proposals, members of the opposition demanded in an amendment that immediate steps should be taken to secure full self-government for the island in its internal affairs; and a unanimous vote of the house was given in favour of setting up a committee to draft proposals for full self-government with dominion status within the British Commonwealth.

Shipments of bauxite-bearing ore were made during the first half of the year. It was estimated that a minimum of £22,000,000 would ultimately be invested in this industry. A factory capable of supplying all the cement needed by the colony was erected on the outskirts of Kingston and began operations in January. The Agricultural Development corporation and the Industrial Development corporation were set up.

The amount expended on the banana rehabilitation scheme, which was started after the hurricane of 1951, rose far above the £500,000 originally allocated and was expected to reach £1,046,000 by the end of 1952, by which time the industry was expected to have recovered from the effects of the hurricane. The acreage under bananas was increased from about 50,000 before the hurricane to 80,000.

A team of specialists from the International Bank for Reconstruction and Development made a survey to determine the amount of additional employment, national income and investment needed for Jamaica's economic development program; to examine the government's potential financial resources for this development; and to discover ways of attracting foreign capital to the colony. The fifth session of the West Indian conference was held at Montego Bay in November and December.

Education.—*Colony:* schools (1951), 396 denominational and 292 government primary (185,569 pupils); 27 secondary (7,100 pupils). *Cayman Islands:* 12 primary schools (859 pupils). *Turks and Caicos Islands:* 12 primary schools (964 pupils); 1 government senior school; University College of the West Indies.

Finance and Trade.—Budget (1952–53 est.): *Colony:* revenue £14,712,033; expenditure £15,035,420. *Dependencies:* revenue £131,354; expenditure £131,855. Foreign trade (colony 1951): imports £29,000,000; exports £18,390,000. Principal exports: sugar, bananas, rum, cigars, pimento, ginger, coffee, citrus, cocoa and (from Turks and Caicos Islands) salt. Sugar crop (1952) 265,871 tons; bananas 4,000,000 stems for export; rum (1951) 1,580,000 gal. Monetary unit: pound sterling with local notes. (P. H.-Mv.)

Japan. Japan consists of four principal islands, Hokkaido, Honshu, Kyushu and Shikoku (total area: 146,690 sq.mi.), and minor adjacent islands. Total population: (est. Aug. 1951) 84,400,000. Chief cities (1950 pop.): Tokyo (cap., 5,385,071); Osaka (1,956,136) Kyoto (1,101,854); Nagoya (1,030,635); Yokohama (951,189); Kobe (765,435). Principal religions: Buddhism, Shintoism. Emperor: Hirohito; prime minister in 1952, Shigeru Yoshida.

History.—*Foreign Affairs.*—On April 28, 1952, the Japanese peace treaty came into effect, bringing to an end the Allied occupation which had lasted since 1945. Japan thus resumed its place as a fully sovereign member of the society of nations. In proclaiming the treaty, Pres. Harry S. Truman of the United States noted that six years of joint effort to restore Japan as a prosperous and progressive nation had strengthened the bonds of friendship between the Japanese and United States peoples, and expressed confidence that Japan was ready to play its full part in meeting the common menace of communism. Since Japan possessed no regular armed forces, United States troops remained in the country for its own protection under the terms of the Japanese-American security treaty of 1951, which became effective along with the peace treaty. Some fears that

this arrangement might compromise Japan's sovereignty were expressed in Japan, but the diet eventually passed the necessary implementing legislation. An administrative agreement signed on Feb. 27, 1952, defined the conditions under which United States troops would be stationed in Japan, including a sharing of costs between the Japanese and U.S. governments and provision for a form of extraterritoriality.

China had not been invited to sign the multilateral peace treaty, because of disagreement among the treaty's sponsors as to whether it should be represented by the Nationalist or the Communist government. In Dec. 1951 Prime Minister Yoshida had expressed the hope of concluding a treaty with the Nationalist government, while denying any intention of making a treaty with the Communist regime. This statement smoothed the way for ratification of the peace treaty by the United States senate. Negotiations were subsequently opened in Taipei, Formosa, and a treaty of peace between Japan and Nationalist China was signed on April 28. Separate agreements restoring peace and diplomatic relations were also concluded by Japan with India and Yugoslavia. Philippine ratification of the general treaty was delayed by the unsettled question of reparations, on which negotiations were suspended as Japan felt unable to meet the full Philippine claims. In January, however, Japan concluded a preliminary reparations agreement with Indonesia. Japan still had to regularize its relations with its former colony, Korea. Negotiations with the Republic of Korea were opened on Feb. 15, but by October it had been impossible to reach agreement on the numerous outstanding questions, including Japanese fishing rights in waters adjacent to Korea, and the large Korean community in Japan.

The U.S.S.R., Poland and Czechoslovakia had not signed the general peace treaty. The U.S.S.R., in fact, denounced it as illegal and as part of United States preparations for a new war in the far east, and these sentiments were echoed by Communist China. On Jan. 1, however, Joseph Stalin addressed a

friendly message to "the Japanese people," wishing them "success in their gallant struggle for the independence of their homeland." Soviet offers of a trade treaty were rebuffed by Prime Minister Shigeru Yoshida, who on Jan. 30 told the diet that there was no possibility of friendly relations with the U.S.S.R. while the latter still held Japanese prisoners of war and was a party to an alliance with Communist China directed against Japan.

In June Japan formally applied for membership in the United Nations, but although its admission was generally favoured, it was prevented by a soviet veto in September. In 1952, however, Japan became a member of the International Bank for Reconstruction and Development and the International Monetary fund, and was provisionally admitted as an associate member of the U.N. economic commission for Asia and the far east.

Domestic Affairs.—The most noticeable feature of Japanese affairs in 1952 was the revival of a spirit of independence and nationalism, probably an inevitable reaction after more than six years of foreign occupation. This was manifested in many ways. Hundreds of additional political and business figures who had been purged under the occupation were depurged and actively re-entered political and economic life. Among them was Mamoru Shigemitsu, who became leader of the newly named Progressive (formerly Democratic) party. Nearly 200 "depurgees" were elected to the diet in October. In August Japan requested permission from the Allies to release 821 war criminals convicted by Allied military courts. Prewar military elements were beginning to reorganize on a small scale. Although the government's policy of maintaining close ties with the United States commanded widespread support, anti-United States sentiment was fostered by Communists and was reflected in a number of disturbances, of which the largest was the May day riot in Tokyo, in which several hundred persons were injured.

Such outbreaks were cited by the government to justify its action in proposing an Anti-Subversive Activities bill giving the authorities broad powers to discipline or dissolve organizations deemed subversive. The bill was strongly opposed by organized labour (under non-Communist leadership) as well as by the press, universities and other liberal elements, which saw in it a revival of the old Peace Preservation law, the chief instrument of the prewar police state. The General Federation of Japanese Trade Unions led a series of strikes and demonstrations against the bill. As passed in July, the law contained clauses stating that its object was not to suppress freedom of speech, legitimate trade union activity or other rights guaranteed by the constitution.

Other bills opposed by labour, revising the Labor Relations Adjustment law, the Labour Standards law and other occupation measures, were also passed at this session of the diet after some revision.

The question of rearmament was widely debated in 1952. Although the United States clearly wished Japan to undertake greater efforts to provide for its own defense, Japanese opinion appeared hesitant to do so. This reluctance stemmed partly from a widely held belief that rearmament, although desirable, was a luxury which Japan could not afford until its economy had been re-established on a sounder basis. Thus during the debates on the budget, it was argued that the tax burden was already too high, and also that any available funds should be devoted to expanding the nation's productive capacity. Some sections of the public feared that rearmament would lead to restoration of military influence over government as before the war. Others were apprehensive lest a Japanese military force should prove to be a provocation to aggression rather than a defense against it. In this situation the government moved slowly. In January, following discussions between the Japanese

UNLOADING MAIL from a Japan Air Lines plane to a waiting mail truck after civil air service was resumed in Japan. JAL planes were still serviced and flown by Northwest Airlines personnel in 1952 but Japanese pilots and mechanics were being trained to replace them

Government and Allied headquarters, it was announced that the National Police reserve, now organized as a military force though still lacking heavy armament, would be increased from 55,000 to 110,000 in 1952, with a further increase in 1953. In August a security board—in effect a ministry of defense—was established to administer the National Police reserve and the coast guard, and a few days later Prime Minister Yoshida for the first time publicly described the police reserve as “the cornerstone of a new army.”

In August the government decided to dissolve the lower house of the diet, and on Oct. 1 a general election was held. The result was an overwhelming victory for conservative forces, represented chiefly by the Liberal and Progressive parties. The communists elected no candidates, and their share of the popular vote decreased sharply while that of the Socialists increased despite a split in the party. During the campaign the Liberal Party was sharply divided by a personal struggle for leadership between Prime Minister Yoshida and the recently deposed Ichiro Hatoyama, but when the diet met, Yoshida was re-elected prime minister. The principal election issues were armament and economic policy. Hatoyama argued for rearmament, while Yoshida was more cautious; the Progressive position resembled that of Hatoyama. Both right and left Socialists opposed rearmament, the latter more vigorously, in keeping with their neutral foreign policy. In their economic recommendations both Liberals and Progressives appealed primarily to business groups.

As Japan regained independence with U.S. aid withdrawn, the country faced serious economic problems, including a rising population, inadequate domestic supplies of food and raw materials, an export volume still less than half of prewar, a damaged and obsolescent industrial plant, an inadequate power supply and an acute shortage of capital. Temporary relief was provided by “special procurement” orders of supplies for United Nations forces in Korea and by expenditures of United States troops stationed in Japan. In 1951 such payments (together with final instalments of U.S. aid) more than offset the heavily passive balance of Japan's merchandise trade. Hence Japan was able to increase its holdings of foreign exchange from the equivalent of \$536,800,000 in Dec. 1950 to \$1,106,000,000 in April 1952, of which \$659,900,000 was in dollars. Yet this apparently strong position was the result of artificial and temporary factors. In the long run Japan would have to expand its exports greatly in order to support itself. Hence there was considerable demand from Japanese businessmen for relaxation of the restrictions on trade with Communist China. Nevertheless the Japanese government turned a deaf ear to Chinese overtures.

The business boom in Japan produced by the Korean war levelled off in the middle of 1951, largely as a result of international market factors, and the first half of 1952 saw only a slight improvement, accompanied by inflationary pressures. Rising living costs brought numerous demands for wage increases and several major strikes. Japan announced its intention of repaying in full its prewar foreign debt, amounting to more than \$450,000,000 in principal and accrued interest, and negotiations with British and United States bondholders were opened in July 1952.

Education.—Nearly all Japanese adults are literate. In 1948–49 expenditures on education were: national and local governments, 78,307,396,877 yen; private, 6,917,291,278 yen; total 85,225,188,155 yen. In April 1951 there were 21,313 elementary schools, with 315,216 teachers and 11,419,267 pupils; 14,301 secondary schools, with 302,191 teachers and 7,319,978 pupils; 422 colleges and universities, with 44,570 teachers and 420,634 students.

Finance.—During 1952 the official value of the yen continued at 360 to the U.S. dollar. National government expenditures (general account) were budgeted for 1952–53 at 852,800,000,000 yen, an increase of 59,100,000,000 over the previous year. This represented 17% of estimated

JAPANESE COMMUNISTS storming the speakers' stand at the 1952 May day rally in Tokyo. Their action touched off an anti-U.S. riot in which Communists fought to break through police lines around the imperial palace grounds

national income. Major items were 182,400,000,000 yen for defense, 123,700,000,000 for public works and 125,000,000,000 for grants to local governments. Government investments in industry were budgeted at 118,500,000,000 yen, a decrease of 17.5% from the previous year. Revenues were expected to balance expenditures, with 638,100,000,000 yen coming from taxes and stamp revenues and 121,300,000,000 from monopoly profits. In addition expenditures in special accounts (government enterprises, etc.) were budgeted at 1,311,000,000,000 yen.

The Bank of Japan's outstanding note issue in May 1952 stood at 444,003,000,000 yen, against 399,332,000,000 a year earlier. In the same period the bank's holdings of national government securities increased from 170,381,000,000 yen to 192,040,000,000, while commercial bank deposits rose from 1,132,886,000,000 yen to 1,576,323,000,000, and commercial bank loans rose from 976,141,000,000 yen to 1,481,729,000,000. Wholesale prices remained fairly stable from the spring of 1951 to June 1952, while both consumer prices and wages in manufacturing advanced somewhat (see Table I).

Trade and Transport.—Japan's per capita exports in 1951, adjusted for price changes and including “special procurement,” were only 56% of the 1934–38 level; imports were 65% of 1934–38. In the first six months of 1952 Japanese imports declined by about 12% from the same period in 1951, during which they had spurted ahead as a result of the Korean war. Exports were about 20% above the level of January–June 1951. Trade figures for 1948–51 are given in Table II. In 1951 North America (chiefly the United States) provided 46.2% of Japan's imports, Asia 28.8%, Europe 7.7%, Australia and Oceania 7.5%, South America 5.5% and Africa 4.3%. Of exports in 1951, 51.5% went to Asia, 15.7% to North

*January-July. †January-May

America, 10.7% to South Europe, 8.3% to Africa, 7.9% to Australia and Oceania and 5.9% to South America. Foodstuffs accounted for 25% of Japanese imports in 1951 and raw materials for 58%; manufactured products made up 81% of the exports. Textiles were the leading export and textile fibres (cotton and wool) the leading import.

Traffic on Japanese government railways was as follows in 1951 (monthly averages): passenger-kilometres, 6,420,705,000; revenue freight ton-kilometres, 3,073,340,000. Corresponding monthly averages for January-April 1952 were 6,083,181,000 and 3,001,967,000, respectively. In addition, private railways carried a monthly average of 48,851,000 ton-km. of freight in 1951 and 47,352,000 in January-April 1952. In May 1952 the country had 2,640,573 gross tons of steel vessels of 100 tons or more, compared with 1,877,742 in May 1951 and 6,094,271 in 1941. In 1951 32.7% of Japan's imports and 27.2% of its exports were carried in Japanese vessels.

Agriculture.—Weather conditions were good in 1952 and the rice crop was expected to exceed by about 6% the relatively poor crop of the previous year. In 1951, production of staple foods was nearly 10% above the 1931-41 average, but population had increased by about 15% since 1940, and even before World War II Japan produced only about 80% of its own food requirements. Food imports since the war accounted for a large part of its trade deficit (25% of total imports in 1951).

Manufacturing and Mining.—Industrial activity declined somewhat in the last half of 1951 but recovered in the first half of 1952. In June 1952 the index of industrial activity (1934-36=100) stood at 141.4, compared with 137.3 in June 1951. Other June 1952 indexes, on the same base, were as follows (June 1951 figures given in parentheses): utilities 197.2 (185.7), mining 124.7 (119.8), all manufacturing 135.5 (132.4), metals 177.7 (169.2), machinery 174.8 (185.0), textiles 69.5 (63.4), chemicals 133.7 (132.9), food and tobacco 122.2 (100.1). Nonagricultural employment in June 1952 stood at 20,410,000, a gain of 1,060,000 over June 1951. In the same period the number of persons reported as totally unemployed increased from 340,000 to 420,000. (M. S. F.)

Jerusalem. The capital of former Palestine, revered as a Holy City by Christians, Moslems and Jews alike, Jerusalem was divided by a demarcation line established in the Israel-Jordan armistice agreement of April 3, 1949. Pop. (1951 est.): Israel-held new city and capital of Israel, 150,000; Arab-held old city 30,000.

The international position of Jerusalem was still indefinite during 1952, in the absence of any clear pronouncement by the United Nations general assembly. The resolution of the assembly in 1949 calling for an international trust regime for the

city of Jerusalem had not been rescinded. The Israeli government announced in the spring that it intended to move to Jerusalem the foreign office of Israel which had hitherto been in Hakirya, the suburb of Tel Aviv that was the original seat of all the government offices. In Jan. 1950 most of the ministries were transferred to Jerusalem; but the foreign office and ministry of defense remained in Hakirya. Israel's proposal of transfer provoked a warning from the U.S. state department that the United States supported the establishment of a special international regime in Jerusalem, and that its embassy would remain in Tel Aviv. A similar protest was made by the government of Australia.

The celebration of the 3,000th year of Jerusalem, since it became the capital of King David's kingdom, had been fixed for 1952. It was to be marked by the opening of the new convention centre with an international exhibition illustrating man's struggle against the desert. But the building was not completed in time, and the celebration was postponed until 1953. On the other hand, an international scientific conference on desert research, which was to have been a part of the celebration, was held in Jerusalem in May 1952, as originally proposed. It was the first conference of the kind organized in Israel since the establishment of the state.

Another important cultural event of the year was the laying of the foundation stone of the new hospital of the Hebrew university of Jerusalem and the Hadassah, Women's Zionist Organization of America, on a site near the formerly Christian village of Ein Karim, about 6 mi. from the centre of the Jewish city.

In August a conference of Jewish doctors from all parts of the world, except the countries of eastern Europe, was held in Jerusalem to consider medical problems arising out of the mass immigration to Israel. (No. B.)

Jet Propulsion. The year 1952, the 11th year of jet progress following the first jet powered flight with the British-developed Whittle W1 jet engine, marked the advent of turbine engines in the 10,000-lb. thrust category.

Actually, engines in this power class had been in development, on the drawing board and on the test stand, for some time. But in 1952, production models were delivered to the military services for the first time.

Foremost of the 10,000-lb. engines, and one scheduled for wide service use, was the Pratt and Whitney J-57 engine, power plant for the U.S. air force's new intercontinental bomber, the Boeing B-52, the prototype model of which made its first flight on April 15, 1952. The J-57 was scheduled to power a number of other new planes, including a new supersonic interceptor, the Convair F-102. Rated at 10,000-lb. thrust, the J-57 would be developed up to a maximum rating of 15,000 lb. It was this engine upon which United States jet transport builders were pinning their hopes for an efficient commercial turbine-powered design.

There were several other engines in this same power category which reached production status during 1952. Allison division of General Motors Corp. was turning out quantities of its J-71 engine, a development of the earlier and much-lower powered J-35, which had seen wide service use. The J-71 had the same diameter as the J-35, but it was of advanced design and also employed an afterburner for augmented power. Power rating with the afterburner was 9,750-lb. thrust.

Similarly, General Electric Co. Aircraft Gas Turbine division started production of its J-73 engine, an advanced development of the J-47 engine, which was in wide military use during the year. While preserving the basic dimensions of the J-47, the builders were able to boost the power to 9,200-lb. thrust, aug-

entable to about 12,000 lb. through use of the afterburner. The entry of Westinghouse Electric Corp. in the 10,000-lb. class was the J-40, of which there were several models. The J-40-WE-8, rated at about 8,500 lb. was in production late in the year. Just starting in production were two 10,000-lb. versions, the J-40-WE-10 and -12. These ratings were exclusive of afterburner power, which would add another 30 to 40%.

The British did not disclose the extent of production of their new engines, but they had developments in the 10,000-lb. category. The Bristol Olympus was rated officially at 9,750-lb. thrust but it was likely that, with later modifications, it would be developed up to about 12,000 lb.

Information about Russian engines was necessarily sketchy, but the U.S.S.R. was believed to have at least one 10,000-lb. thrust engine in production; power plant for the new model 150 bomber designed by I. Baade, a plane which was comparable to the U.S. air force's Boeing B-47, the engine was known only as the Mikulin turbojet. Also in production was an advanced version of the M-018 design, believed to be rated at between 10,000- and 10,000-lb. thrust.

There were a number of production engines in lower power categories. In the U.S., Allison continued to produce various models (or "dash" numbers) of its J-35 engine, ranging from 6,200-lb. thrust "dry" (without afterburner) to more than 8,000 lb. with afterburner augmentation, and several models of its J-33 which ranged in power from 5,000- to 6,250-lb. thrust dry. There was also the J-33-A-16, a new navy version of the engine which produced up to 8,500-lb. thrust with an afterburner (the afterburner version was known as the J-33-A-29).

General Electric had several models of its J-47 in production, the most powerful being an afterburner version used in the North American F-86D all-weather fighter and known as the J-47-GE-17. It developed slightly more than 8,000-lb. thrust. The other production models of the J-47 were in the 5,800- to 6,200-lb. thrust category.

Pratt & Whitney, in addition to the aforementioned J-57, was producing the J-48, a navy engine officially rated at 6,250-lb. thrust. An improved version, the J-48-P-8, developed more than 6,000-lb.

Westinghouse was turning out the low-powered, but small diameter J-34 engine, the most powerful model of which developed 3,400-lb. thrust. The small diameter, however, permitted installing the J-34 in pairs. J-34 installations were gradually being replaced by the previously described J-40.

Wright Aeronautical had only one production jet engine, the 6,200-lb. thrust J-65, being built for the U.S. air force. The J-65 was a U.S. counterpart of the British Armstrong Siddeley Sapphire. It was slated for eventual development to 8,400-lb., a rating which Armstrong Siddeley had already achieved on the first stand. First production models were delivered in mid-1952. In Canada, A. V. Roe Canada, Ltd. continued to produce its 6,000-lb. thrust Orenda engine. Plans to equip the Orenda with an afterburner installation would boost its power over the 6,000-lb. mark.

In Great Britain, Rolls Royce was turning out various models of the Avon axial engine in the 7,000- to 8,000-lb. thrust class and was winding up production of its two centrifugal flow types, the 3,500-lb. thrust Derwent and the Nene, which had been developed up to about 6,000-lb. Armstrong Siddeley was producing 6,500-lb. thrust versions of its Sapphire and de Havilland Engine Co., Ltd. was building the Goblin (3,500-lb.) and the Ghost (5,500-lb.).

The U.S.S.R.'s major production appeared to be the M-45 helicopter engine (6,250-lb.) used in the MIG-15 fighter. There was also an M-012 6,500-lb. thrust engine in production.

In France, Hispano-Suiza S.A. was producing the British Rolls

R.A.F. METEOR F.R. 9 jet planes flying straight up during aerial manoeuvres over the Suez canal in 1952. The photo was made from a companion meteor flying close to the formation

Royce Nene and Tay under licence. The French Nene turned out about 6,000-lb. thrust, the Tay about 6,500-lb. An important engine of French design, the Atar, built by Société Nationale d'Étude et de Construction de Moteurs d'Aviation (SNECMA), was in wide production for the French Air Force's Dassault Mystere fighter. Various models of the Atar were in the 6,000- to 7,000-lb. thrust category and production was planned for an afterburner model which would produce 9,000-lb. thrust.

While the 10,000-lb. thrust engines were being turned out in quantity, development work was under way on a large scale for even more powerful engines. In the U.S., General Electric was developing an engine designed for 20,000-lb. thrust, the J-53. Pratt & Whitney was at work on a 15,000-lb. unit known as the J-75 and Wright had the J-67, a U.S. version of the Bristol Olympus, designed for 13,000-lb. Pratt & Whitney and Westinghouse were also working on advanced developments of their J-57 and J-40 engines which would be in the 13,000-lb. class.

Britain had on the test stand the Rolls Royce Conway, a bypass type of engine in which one part of the air stream bypassed the compressor and joined the main airflow aft of the turbine. It had a thrust rating in the 11,000- to 12,000-lb. category. De Havilland and Rolls Royce were known to be working on advanced axial-flow types in the 15,000-lb. range, but they had not been identified officially. Bristol also had a new version of its Olympus which would be in the 13,000-lb. class.

The highest-powered French development known was the SNECMA Vulcan, a 10,000-lb. thrust engine.

Turboprop Engines.—Production of turboprops in the U.S. was confined to the Allison T-38 and T-40 and the Pratt & Whitney T-34. The T-38 turned out 2,750 h.p. and the T-40 was a coupling of two T-38's for a 5,500-h.p. rating. The T-34 was rated at 5,700 h.p. but later models were expected to turn out 6,000 h.p.

Allison was completing development of a new T-56 engine, which was an advanced version of the T-38, producing 3,750 h.p.

Pratt & Whitney and Wright were working on higher powered engines. Wright was developing an 11,000-h.p. unit known as the T-49 and also had a T-47 of even greater power. Pratt & Whitney had an engine in the 10,000-h.p. class, the T-48.

In Britain, Armstrong Siddeley was producing the Mamba (1,500 h.p.), the Double Mamba (3,000 h.p.) and the Python (4,000 h.p.). Bristol had several versions of its Proteus, basically rated at 3,500 h.p. with the Coupled Proteus, two single units mounted together, turning out 7,000 h.p. Paralleling the Allison procedure in the U.S., Bristol had developed the Proteus 3 up to 3,800 h.p. and was expected to put a new Coupled Proteus of 7,600 h.p. in production. Rolls Royce was producing two versions of the 1,500-h.p. Dart. D. Napier & Son Ltd. had a 4,000-h.p. turboprop called the Eland. De Havilland was reportedly developing a high-powered engine in a class with the Pratt & Whitney T-48, but no information about it was released.

The Russians had a 6,500-h.p. turboprop in a new version of the TU-95 bomber, the copy of the Boeing B-29. The engine was identified as the PTL 022, a propeller version of the M-012 turbojet mentioned earlier. The U.S.S.R. had a more powerful turboprop, the M-028, in limited production. A development of the German B.M.W. 028, it had a rating of considerably more than 8,000 h.p.

Rocket Engines.—Rocket engines were not in wide production in any of the Western countries, since they were not regarded as practical power plants for operational service aircraft because of their limited endurance. They were still in development in both the U.S. and Great Britain, however, for use in specialized research aircraft. The outstanding development in this engine category was the Curtiss-Wright XLR-25, which was finally delivered to the U.S. air force in mid-1952 after years of

development work. Specified as the power plant for the Bell X-2, a supersonic research plane expected to attain speeds above 2,000 m.p.h., the XLR-25 was the first rocket engine capable of being throttled like a turbojet; in previous rocket engines such as the Reaction Motors 6000C4 which powered the Bell X-1, first supersonic plane, power was regulated by the number of cylinders fired. The XLR-25 developed 12,000-lb. thrust and was probably the highest powered rocket engine ever to be installed in a piloted airplane.

In Britain, de Havilland was reportedly working on a project similar to the XLR-25, with throttling capabilities, but in a lower thrust bracket. The engine was named the Spectre. Armstrong Siddeley was continuing development work on its light weight auxiliary power plant, the Snarler, which weighed only 215 lb. and developed 2,000-lb. thrust. Armstrong Siddeley also had a new project, the Screamer, in the 6,000-lb. class.

No information on specific rocket engine developments had leaked through the "iron curtain," but it came to light that the U.S.S.R. was conducting tests with high-speed rocket-powered fighters.

Other Types.—Both the U.S. and Great Britain were known to be working on large ramjets for guided missiles. A ramjet is an engine which compresses the air by the impact of the air on the inlet moving at very high speed ("ram") rather than by a compressor installation such as the turbojet employs. Small, low-powered ramjets and pulsejets (a ramjet with an intermittent pulsing thrust rather than continuous power) were in limited production for use on helicopters.

Considerable progress was made on development of nuclear power plants for aircraft during the year, and the project reached the point where the U.S. air force awarded contracts to two companies for development of an airframe to carry the first nuclear engine. There were two parallel developments in this field, Consolidated Vultee Aircraft Corp. and General Electric Co. working on one airframe-engine combination while Boeing Airplane Co. and Pratt & Whitney were working on another. Johnson, Edwin Carl (1884-), U.S. senator, was born on Jan. 1 at Scandia, Kan. As a boy he moved with his parents to Nebraska, and was graduated from the Lincoln, Neb., high school in 1903. He worked as a railroad section hand, telegrapher and train dispatcher, and in 1909 he moved to Colorado, where he homesteaded on government land. He was elected to the Colorado state legislature for four terms (1923-31), was lieutenant governor of the state from 1931 to 1933 and governor for two terms (1933-37). In 1936 he was elected Democratic senator from Colorado and was re-elected in 1942 and again in 1948 for the term 1949-55. He broke with the New Deal over the issue of Pres. Franklin D. Roosevelt's attempt to "pack" the U.S. supreme court in 1937. Johnson opposed Roosevelt's nomination for a third term and suggested the founding of a third party opposed to U.S. involvement in World War II. Later, however, he supported U.S. entry into the United Nations and recommended that the U.S. spend "billions of dollars" on the Point Four program of technical and financial aid to foreign countries. In 1952 Sen. Johnson was cam-

campaign manager for Sen. Richard B. Russell of Georgia in the latter's unsuccessful bid for the Democratic presidential nomination.

Jordan. An independent Arab kingdom, Jordan is bounded west by Israel, north by Syria, east by Iraq and southeast and south by Saudi Arabia. Area (including Arab Palestine): about 37,100 sq.mi. Pop. (1951 est.): 1,320,000. Capital: Amman (pop., 1951 est., 170,000). Language: mainly Arabic. Religion: Moslem (chiefly Sunni); Christian about 8% (chiefly Arab-speaking Greek Orthodox). Kings in 1952: Talal I and (from Aug. 11) Hussein I; prime minister, Tewfik Abu-Huda.

History.—King Talal and Queen Zeine left Amman on a visit to Europe on Jan. 10, 1952. They returned on Feb. 5; but on May 18 they again left for France and a council of regency consisting of the prime minister, the president of the senate and the president of the chamber of deputies assumed constitutional powers. On June 1, the regency council and the cabinet heard a report from the prime minister and the defense minister (Suleiman Tukan) who had had discussions in France with the king. After a secret session of parliament, the government announced that a new regency council consisting of Ibrahim Hashem, Suleiman Tukan (who had resigned from the government) and Abdurrahman Rusheidat would act for the king because of his deteriorating health. Before reaching this decision, the government had rejected a suggestion from the emir Abdulilah, the regent of Iraq, that a senior representative of the Hashemite royal house should preside over the regency council. Meanwhile, King Talal had informed the cabinet that he approved the government's actions and that he was on his way back to Amman. He arrived on July 3 and placed himself unreservedly at the disposal of his government. On Aug. 11 the government declared the termination of King Talal's reign because of his mental state, and the accession, in his place, of Crown Prince Hussein as king. The council of regency was reappointed to act until the new king's coming of age on May 2, 1953. On Aug. 25 King Hussein arrived in Jordan. On Sept. 8 he left it again for Great Britain to enter the Royal Military college on a four months' course of training. Talal had in the meantime retired to Egypt for treatment.

On Feb. 16 the Jordan government signed the Arab league's Security and Economic Aid pact which came into force on Aug. 23, having also been ratified by Egypt, Syria, Iraq and Saudi Arabia. On April 13 an official Spanish mission visited Amman.

Throughout the year further sporadic frontier affrays persisted along the Jordan-Israel border and on May 29 the prime minister denied reports that Jordan would reach a settlement with Israel involving the cession of any Jordanian territory.

During the summer, plans were announced for the Yarmuk river scheme, to be financed by the U.N. Relief and Works agency. The upper waters of the river would be canalized over an 800-ft. waterfall through a power station and would continue in an irrigation canal the whole length of the Jordan valley down to the Dead sea, where another power station would be built. The Syrian government's consent to the scheme had been secured. The scheme, which would take three years to complete, would bring 180,000 ac. under cultivation in the Jordan valley.

Other projects included the exploitation of the potash resources of the Dead sea under Jordanian management with government assistance; the mining of phosphates in east Jordan under an Italian concession and of barytes near Aqaba under a British concession; and the construction by the government

of a road from Amman to the port of Aqaba on the Red sea out of funds provided by a British loan which was negotiated in the spring of the year.

On Aug. 4 the government abolished the titles of "bey" and "pasha" hitherto conferred as a token of favour by the royal house.

Jordan became the 54th member of the International Monetary fund on Aug. 29. (O. M. T.)

Education.—Government schools (1950) 328, pupils 56,625, teachers 1,462.

Finance and Banking.—Budget (1949-50) balanced at 3,400,000 dinars; (1950-51 est.) revenue 3,300,000 dinars, expenditure 3,800,000 dinars. Monetary unit: Jordan dinar at par with the pound sterling and with an exchange rate of 0.357 dinars to the U.S. dollar.

Foreign Trade.—(1950) Imports 10,767,000 dinars; exports, including re-exports, 1,982,000 dinars. Export figures include bullion (silver coins exported to the U.K. amounting to 409,650 dinars in 1950). Main sources of imports (1950): U.K. 26.1%; Syria and Lebanon 12.3%; Italy 8.7%; Iran 8.0%. Main destinations of exports (excluding bullion): Syria 95.3%; Egypt 2.1%. Main imports: textiles 11.3%; sugar 6.9%; building materials 5.9%; motor vehicles and spare parts 3.5%. Main exports (excluding bullion): cereals 29.3%; raw wool 14.1%; vegetables 13.6%; olive oil 9.9%; fruits 7.8%.

Transport and Communications.—All-weather roads, 1950 (east of Jordan river only): 395 mi. Licensed motor vehicles (Dec. 1950): cars 2,150, commercial vehicles 1,800. Railways (1950): 280 mi. There were two air transport companies, Arab Airways association and Air Jordan. Miles scheduled per week by Arab Airways association (1950): 5,268.

Agriculture.—Main crops (metric tons, 1950): wheat 106,000; barley 41,000; millet 14,000; lentils 8,100; kersennah 8,200; tobacco 200; dry beans (1949) 2,000. Livestock (1949): goats 332,000; sheep 113,000; horses 3,000; asses 26,000; cattle 64,000; mules 2,000; camels 4,000.

Judaism. During 1952 the stream of immigration to Israel narrowed still further, to a rate of from 2,000 to 3,000 per month. To the decimated Jewish communities of Europe the retarding process of emigration was not devoid of some benefit. When men deem their residence in a country to be

LIFTING OF THE TORAH in a synagogue on the island of Djerba off the south coast of Tunisia. Religious custom remained almost unchanged from biblical times in the ancient Jewish colony but its younger members were rapidly migrating to Israel in 1952

temporary, their concern over the effectiveness of its religious, cultural and social institutions is bound to be weak.

The hope of a revitalized Jewish life in the U.S.S.R. and its satellites was more than dim. This was a result not only of the Communists' subtle but effective policy of religious and cultural suppression, but also of their program of transplanting Soviet subjects, especially when suspicion of counterrevolutionary activity could be levelled against such subjects.

Jewish life in the United States conformed to its set pattern. The American Jewish committee and the B'nai B'rith withdrew their delegates from the sessions of the annual conference of the National Community Relations Advisory council because of their unwillingness to adopt the recommendations of the MacIver report, which specified where and how duplication could be eliminated and Jewish activity be more integrated.

An event pregnant with promise was the indemnity agreement arrived at by the representatives of the Israeli state, the various international Jewish organizations and the west German government. The foreign minister of Israel, Moshe Sharett, characterized it as "unique in the annals of international relations" because the overture was voluntarily made by the Bonn regime when the *bundestag*, in the previous year, approved a resolution stating that the "unspeakable crimes" of the nazis against the Jews "impose upon the German people the obligation to make moral and material amends." The agreement stipulated that \$715,000,000 was to be paid in goods to Israel during a period of 14 years, as part of the cost which it assumed in transporting and settling the surviving victims of the nazi regime. The 22 Jewish organizations were to receive \$107,000,000 as a token payment of the wealth which was still in the possession of Germans, because the former owners had been killed and had left no heirs.

These agreements of the delegations of west Germany and Israel were yet to be approved by the parliaments of their respective states. Vehement protests against the settlement came from the Arab nations. Their arguments were that since a state of war between them and Israel still formally existed, the above restitution constituted an unfriendly act.

Notwithstanding this hostile attitude, the Israeli government made an agreement with the United Nations Palestine Conciliation commission to pay Arab refugees an initial £1,000,000 (\$2,800,000) out of accounts frozen in Israel. This step was not conditioned by any similar act on the part of any Arab nation which had frozen and confiscated the property of Jewish subjects who were forced to take up residence in Israel. (See also RELIGIOUS EDUCATION.) (B. H.)

Juliana (LOUISE EMMA MARIE WILHELMINA OF ORANGE-NASSAU) (1909-), queen of the Netherlands, was born at The Hague, April 30, the daughter of Queen Wilhelmina and Prince Consort Henry. On Jan. 7, 1937, she married Prince Bernhard zu Lippe-Biesterfeld (b. 1911). Four children, all daughters, were born of this

marriage: Princess Beatrix Wilhelmina Armgard (b. 1938), Princess Irene Emma Elizabeth (b. 1939), Princess Margriet Francisca (b. 1943) and Princess Maria Christina (b. 1947). After the German occupation of the Netherlands, Princess Juliana went to Canada, and from Sept. 1944 stayed with her mother in England. After the liberation Princess Juliana returned to the Netherlands and lived at Soestdijk. On Sept. 6, 1948, two days after the abdication of her mother, she was enthroned as queen of the Netherlands at the historic Nieuwe Kerk of Amsterdam. In 1950 Queen Juliana, accompanied by Prince Bernhard, paid official state visits to Paris and London. She attended the funeral of George VI on Feb. 14, 1952.

In April she paid an official visit to the United States and on April 3 addressed congress. On April 21 she arrived in Ottawa, Canada, on an informal visit as the guest of governor general Vincent Massey.

Juvenile Delinquency. Progress in understanding and treating juvenile delinquency depends on joint participation of governmental and citizen agencies, representing law, medicine, psychology, education, social work, parenthood and religion. Throughout the U.S., civic groups during the year 1952 held public forums on this question. One difficulty was lack of accurate knowledge as to the extent of the problem.

Juvenile delinquency is a legal term to denote an offense committed by a minor within the age limit set up by state legislature or the federal government. The standard juvenile court law states that the offense shall not be considered a crime and that the "care, custody and discipline shall be that which should have been given by the parents." The court is to act on the principle of *parens patriae*. Within the various states this protection is given from age 16 to 21 as the upper limit, the average age being 18. It is 16 in New York and New Jersey, 17

"GAMBLERS" at the Institute for the Scientific Treatment of Juvenile Delinquency in London where boys were encouraged even in their most violent games so that staff members could get clues to some of the reasons for their petty crimes

in Massachusetts, and 21 in California, Arkansas and Arizona.

One hundred and sixty-four juvenile courts report annually to the federal children's bureau, furnishing the only source of reliable statistical information as to the extent of juvenile delinquency. About one-third of the nation's courts do not report. Local police systems also handle juvenile delinquents. Their methods of reporting are not uniform. Thus there is no accurate census. From the information available it appeared that serious offenses among children under 16 had decreased approximately 10% since 1947. Los Angeles, New York city and New Orleans reported sharp increases of minors between 16 and 18 taken into custody for examination on suspicion of drug addiction. With the exception of Chicago, the trend was downward. This was particularly noted in the New England states and in Virginia and Wisconsin.

Boys continued to furnish the majority of delinquents. Taking the country as a whole, girls represented less than 11% of the commitments to correction institutions. Boys led in offenses involving theft and violences. Girls led in sex offenses.

The importance of preventive work is recognized in many states by the establishment of clinics where children with emotional and social difficulties receive physical and mental diagnosis and treatment. Some state universities and departments of mental health maintain child welfare centres.

During 1952 an increasing number of juvenile courts were using private agencies to supplement state correctional schools. During the year the Sweetser Children's home, Saco, Me., under Linwood Brown, director, opened its doors to some court and state wards under a co-educational family life plan. The children received expert medical, psychological and social case-work. They attended the local schools and shared community activities. The private agency plan in treatment of delinquency was arousing citizen responsibility. (M. V. W.)

Kansas. Kansas was admitted to the union as the 34th state on Jan. 29, 1861. It is frequently called the "Sunflower state." The total area is 82,276 sq.mi. of which 82,108 sq.mi. are land. Kansas is located in the geographical centre of the continental United States and is the geodetic centre of the North American continent from which all geodetic surveys are made.

The 1952 population as reported by the Kansas state board of agriculture was 1,980,073, the highest ever recorded in the state. The 1950 census showed a population of 1,905,229. The population was about equally divided between urban and rural. Capital, Topeka, pop. 93,637 (1952). The two largest cities in 1952 were Wichita, 211,796, and Kansas City, 126,947.

History.—The principal state officials in 1952 were: Edward F. Arn, governor; Fred Hall, lieutenant governor; Paul R. Shanhan, secretary of state; George Robb, auditor; Adel Throckmorton, superintendent of public instruction; Frank Sullivan, insurance commissioner; Harold R. Fatzer, attorney general; Ferdinand Voiland, state printer; Richard Fadely, treasurer. The 1951 legislature authorized the governor to appoint a director for the newly created commission, division of administration. Arnold Jones became the director of this department, which has the purpose of reorganizing the fiscal affairs of the state. In the primary election held in Aug. 1952 all of the incumbent state officers were renominated.

Education.—As of Sept. 30, 1952, there were 2,270 one-teacher schools in Kansas, with an enrolment of 25,332. The enrolment (1951-52) in elementary and secondary schools, including kindergarten, was 254,483 (85,085 in secondary schools). There were 17,985 teachers and administrators employed in the state system. The combined enrolment of the four state colleges and one university was 15,281.

The populations of other state institutions were as follows: school for the blind 95; school for the deaf 268; Kansas Technical institute (Negro) 150.

Table I.—Principal Crops of Kansas

Crop	Indicated		Average 1941-50
	1952	1951	
Wheat, bu.	308,676,000	126,113,000	197,949,000
Corn, bu.	57,960,000	58,296,000	71,894,000
Sorghum grain, bu.	16,926,000	57,310,000	25,109,000
Oats, bu.	19,646,000	14,346,000	31,817,000
Barley, bu.	2,254,000	1,547,000	10,580,000
Soybeans, bu.	7,500,000	5,814,000	2,782,000

Social Insurance and Assistance, Public Welfare and Related Programs.—The populations of the state's welfare institutions in 1952 were as follows: hospitals for epileptics 658; state training school 1,400; hospitals for tuberculars 400; orphans and receiving home 179; industrial school for girls 81; industrial school for boys 132; industrial farm for women 55; hospitals for insane 4,769; state penitentiary 1,480; reformatory for boys 412.

The 1951 legislature appropriated approximately \$21,263,000 for public welfare institutions and correctional institutions. Public expenditures of all types in 1951-52 (calendar year) totalled \$33,846,756.10, including old-age assistance \$22,977,719.89; needy blind \$396,003.25; dependent children \$4,497,498.92. There were 48,940 persons receiving public welfare assistance in 1951.

Communications.—As of June 30, 1952, the total length of primary and secondary roads in the state was 133,197 mi. The state maintained 9,425.5 mi. of rural and 519.2 mi. of urban highways, the remainder being controlled by their respective municipalities. The total highway expense for 1951 was \$33,379,527.19 (not including expense for county roads). As of Aug. 1, 1952, the state highway commission had contracted for 1,758 miles of construction type work on the primary and secondary highway systems of Kansas at a cost of \$22,963,394. The bridges contracted on the two systems during this period totalled 121 at a cost of \$3,356,376. Kansas had 8,415 mi. of railroads. There were 73 privately owned and 1 Civil Aviation administration airports.

Banking and Finance.—The budget for the biennium 1952 and 1953 totalled \$67,167,483, an increase of \$7,124,677 over the previous budget of 1950 and 1951. Sales tax (2%) collected for the fiscal year 1952 totalled \$46,672,289. The income tax for 1952 totalled \$14,848,862. The bonded indebtedness (soldier's bonus) totalled \$2,250,000 as of June 30, 1952. There were 174 national banks, 435 state banks and 3 trust companies. Of the state banks, 297 were insured under the provisions of the Federal Deposit Insurance corporation. The deposits in the national banks and insured state banks totalled \$1,650,631,104.32 as of June 30, 1952.

Agriculture.—An all-time record wheat crop of 309,000,000 bushels highlighted the 1952 Kansas crop season. The dry summer that favoured maturity and harvesting of the wheat crop was detrimental to production of corn, sorghums, hay and other crops, with production of most grain and forage crops falling below average. Even though hampered by a dry growing season, production of soybeans was also a record, because of the greatly expanded acreage grown. Production of livestock and livestock products during the year continued at a high level. Inventory numbers on Jan. 1, 1952, of most species of livestock and poultry were above a year earlier, with cattle numbers reaching a record high of 4,341,000 head.

Cash receipts from farming marketings of Kansas agricultural products for the first six months of 1952 were 9% higher than during the corresponding period in 1951. Increased marketings of wheat more than offset lower prices of livestock and livestock products.

Manufacturing.—In 1951 there were nearly 3,000 manufacturing and processing plants engaged in the production of more than 1,000 items. The total value added by the manufacturer was approximately \$500,000,000. (Ed. F. A.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Kansas in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Kansas ranks ninth among the states in the value of mineral output, with 3.11% of the U.S. total.

Table II.—Mineral Production of Kansas

(Short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Cement (bbl.)	8,759,000	\$19,400,000	7,641,000	\$16,880,000
Clays	352,000	321,000	302,000	260,000
Coal	2,125,000	8,234,000	2,031,000	7,968,000
Lead	9,000	2,561,000	10,000	3,088,000
Natural gas (000 cu.ft.)	364,024,000	24,026,000	294,078,000	15,910,000
Natural gasoline (bbl.)	2,572,000	6,146,000	1,880,000	4,772,000
Petroleum (bbl.)	107,586,000	276,500,000	101,868,000	262,820,000
Petroleum gases (bbl.)	1,115,000	1,487,000	768,000	1,164,000
Salt	846,000	5,915,000	832,000	5,218,000
Sand and gravel	9,781,000	6,782,000	6,187,000	3,328,000
Stone	7,630,000	8,920,000	5,978,000	7,952,000
Zinc	27,000	7,718,000	29,000	7,300,000
Other minerals	604,000	...	502,000
Total		\$368,614,000		\$337,162,000

Kashani, Abul-Kasim Hossaini (1890?—), Iranian politician, was educated at Karbala, the sacred shrine of the Shi'ite Moslems in modern Iraq, where he lived for several years as a theologian. After being expelled from Iraq by the government for his politi-

cal activities in 1922, he returned to Iran to continue his religious career. In 1943 he came to prominence during the Allied occupation of Iran, as a leading supporter of the pro-German fifth column, in collusion with the grand mufti of Jerusalem and Rashid Ali of Iraq. He was interned by the British occupation forces from June 1944 to Aug. 1945. When an attempt to assassinate the shah failed in Feb. 1949 he was once more arrested, but allowed to go into exile in Syria, whence he returned to Tehran in June 1950. In December he published a manifesto demanding the nationalization of Iranian oil, and thereafter he was closely associated with Mohammed Mossadegh in the campaign for evicting the Anglo-Iranian Oil company. Kashani was elected a deputy for the National Front to the *majlis* in Jan. 1952, and president of the *majlis* in the following August.

Kashmir: see INDIA; UNITED NATIONS.

Kefauver, Estes (1903–), U.S. senator, was born on July 26 in Madisonville, Tenn. He attended the University of Tennessee, Knoxville, and Yale law school, practised law in Chattanooga and in 1939 was appointed state commissioner of finance and taxation. In May of that year he was elected to fill out an unexpired term in the U.S. congress, left vacant by a death, and he eventually served five terms in the house of representatives, where he was increasingly concerned with modernizing the machinery of government. In 1948 he was elected to the U.S. senate.

Kefauver gained unusual attention during 1951 as chairman of the U.S. senate crime investigation committee, whose televised hearings attracted huge metropolitan audiences. The committee's reports gave detailed evidence of political-criminal alliances reaching into city, state and federal offices; described gambling as a \$20,000,000,000-a-year industry; urged laws to curb rackets; and asked for a permanent nonpartisan commission to police the crime-corruption situation. Senator Kefauver himself, however, indicated a desire to turn from this investiga-

tion to devote more attention to foreign affairs.

Kefauver was a prominent candidate for the Democratic presidential nomination in 1952, waging a hard campaign in all parts of the country and leading all other candidates in the number of delegates pledged to him in primary elections. He also led on the first and second ballots at the Chicago convention in July, but was unable thereafter to halt the stampede of delegates to Gov. Adlai E. Stevenson of Illinois.

Kellogg Foundation: see SOCIETIES AND ASSOCIATIONS, U.S.

Kennan, George Frost (1904–), U.S. diplomat, was born on Feb. 16 at Milwaukee, Wis. He attended Princeton university, entered the U.S. consular service and served in a number of European cities. After the U.S. established diplomatic relations with the U.S.S.R. in 1933, Kennan was sent to Moscow. There, during several years of residence broken by periodic appointments to other posts, he acquired a thorough knowledge of the Russian language, and the history, current political trends and diplomatic policies of the U.S.S.R. The U.S. policy of "containment of communism," first stated publicly in an article appearing in *Foreign Affairs* in July 1947 and signed simply "X" was credited to him. At that time Kennan (shortly nicknamed "Mr. X" by the U.S. press) was chief of the new long-range planning staff of the U.S. department of state. In 1950 he left the state department to join the Institute for Advanced Study at Princeton university and later was appointed head of the Ford foundation's East European fund.

Late in 1951 he accepted appointment as ambassador to the U.S.S.R. to succeed Adm. Alan G. Kirk. The White House announced on Dec. 26 that Moscow had approved this appointment, but on the same day *Pravda* published a violent attack on Kennan for his anticommunism. He presented his credentials at the Kremlin on May 14. In July 1952 he issued a strong protest to the soviet foreign office against what he termed the U.S.S.R.'s "Hate America" propaganda. On Oct. 3, 1952, the Kremlin demanded Kennan's recall, charging that he had made "slandorous attacks" on the U.S.S.R.

Kentucky. An east south-central state of the United States, admitted to the union on June 1, 1792, Kentucky is popularly called the "Blue Grass state." Area: 40,395 sq.mi., of which 531 sq.mi. are water. The population by the 1950 official census was 2,944,806, a gain of 3.5% in a decade. The foreign-born population was 16,068, of whom 11,022 were in the cities. The capital, Frankfort, had a population of 11,916. The three largest cities were: Louisville (369,129), Covington (64,452), Lexington (55,534).

History.—The legislature, which adjourned March 21, 1952, enacted some notable laws, especially in social welfare and education. It removed mental hospitals from the department of welfare and placed them under a new department of mental health. It created a youth authority for the individual study of each child who becomes a ward of the state with the idea of making him an asset to the state. It provided that people suspected of mental sickness be taken to hospitals rather than jails, when arrested. It required the segregation of sex cases in state hospitals. It enacted a hospital-licensing bill and required approval of the state board of health for operation of hospitals. It strengthened the laws allowing inspection of relief rolls by county advisory committees with the idea of eliminating cheaters with as little publicity as possible. It provided for the revocation of a liquor dealer's licence if gambling on the licensed grounds was proved. It also made bribing an athlete or taking a bribe to affect an athletic contest a felony.

"THE LONE RANGER," a 1952 cartoon by Fitzpatrick of the St. Louis Post-Dispatch

The state officers in 1952 were: governor, Lawrence W.etherby; lieutenant governor, Emerson Beauchamp; secretary of state, Charles K. O'Connell; auditor, T. Herbert Tinsley; attorney general, J. D. Buckman; treasurer, Pearl Frances Runn; superintendent of public instruction, Wendell P. Butler; commissioner of agriculture, Ben S. Adams; and clerk, court of appeals, Acree Austin.

Education.—Public schools in 1951-52 numbered 4,349 elementary schools, 113 high schools and 416 combined elementary and high schools. Total public-school pupils, grades 1-12, numbered 562,133, and full-time teachers, exclusive of principals, supervisors, helping teachers, etc., numbered 18,188. The state per capita fund was \$26,212,500, and the equalization fund was \$5,573,000.

Social Insurance and Assistance, Public Welfare and Related Programs.—Employment insurance paid for the 1952 fiscal year amounted to \$12,616,737, or an average of \$17.23 for 723,747 weeks. Old-age assistance amounted to an average of 64,972 persons monthly for a yearly total of \$22,331,118. Aid to dependent children amounted to \$10,615,611 for an average monthly number of 21,156 families or 55,063 children. Aid to the blind amounted to \$950,837 for a monthly average of 2,520 recipients. The population of the correctional institutions on Aug. 31, 1952, was: reformatory, 1,908; penitentiary, 984; women's prison, 68; houses of reform: boys, 327; girls, 95. As of Sept. 30, 1952, Kentucky had 82 dry counties, 27 wet counties and 11 split counties (one or more wet precincts dry counties).

Communication.—As of June 30, 1952, the Kentucky department of highways had under maintenance 15,389 mi. of road. Two public toll bridges and four private toll bridges over the Ohio river then served traffic. Road and receipts for the fiscal year amounted to \$60,882,415.68; expenditures amounted to \$66,044,719.15. The state had 820,339 registered automobiles and motor vehicles for the calendar year 1951. Miles of railroad amounted to 3,860.42 of first main track in 1950. Aeroplanes carried 834,641 passengers in 1951. In July 1952 Kentucky had 29 cities with 42 radio stations and 178 newspapers, of which 30 were dailies. Telephones in service in 1951 numbered 487,822.

Agriculture.—In 1950 percentage receipts from Kentucky farm markets were: tobacco, 35; cattle and calves, 23; dairy products, 11; hogs, 8; eggs and chickens, 6; corn, 4; sheep and wool, 2.

Table I.—Principal Crops of Kentucky

	Indicated 1952	1951	Average 1941-50
Wheat, bu.	61,741,000	80,662,000	77,241,000
Barley, bu.	4,540,000	3,568,000	5,173,000
Oats, bu.	2,626,000	2,136,000	2,103,000
Corn, bu.	1,512,000	1,192,000	1,842,000
Beans (for beans), bu.	1,564,000	2,470,000	1,502,000
Hay, tons	2,100,000	2,277,000	2,328,000
Tobacco, all types, lb.	452,162,000	460,370,000	397,950,000
Potatoes, bu.	1,596,000	1,960,000	3,265,000
Potatoes, sweet, bu.	336,000	462,000	1,141,000

Oranges, bu.	497,000	72,000	572,000
Almonds, bu.	92,000	56,000	128,000

Source: U.S. Department of Agriculture.

Banking and Finance.—On June 30, 1952, there were 92 national banks in Kentucky with total assets of \$709,893,000 and 290 state banks and trust companies with resources of \$1,081,217,820.20. Preliminary returns indicated a total tax revenue for the fiscal year ending June 30, 1952, of \$1,267,458 for the general fund and \$56,000,780.27 for nontax receipts. For the general fund, income taxes contributed about \$18,112,468, corporation income taxes \$10,853,451 and cigarette taxes \$5,533,348. Five other taxes—distilled spirits consumption, distilled spirits production, tangible personal property, foreign life and fire insurance premiums, and utility gross receipts—in descending order contributed from \$3,455,468 to \$1,044,852 each. Intangible personal property and inheritance taxes in most equal amounts yielded a total of \$4,920,993. The estimated expenditures exclusive of roads for 1951-52 were: welfare, \$67,205,637; education, \$51,164,913; general government, \$17,253,775; and agriculture and conservation, \$3,712,354.

Manufactures.—In 1951, 55 new plants, employing 27,934 labourers at an estimated additional annual pay roll of \$83,802,000, contributed a net value of \$1,054,809,400. The value of nondurable sales in 1951 was about \$1,893,000,000. The ranking was food (\$847,000,000), tobacco, chemicals, apparel, petroleum and coal, printing, textiles and leather (\$34,000,000). Durables had a sales value of approximately \$972,000,000, the ranking being: machinery (\$239,000,000), primary metals, fabricated

metals, lumber, furniture, electrical machinery, transportation equipment, stone, clay and glass combined and instruments (\$12,000,000).

Commerce.—Kentucky's retail trade in 1951 employed an estimated 90,300 workers and had sales amounting to \$2,156,000,000. The wholesale trade employed only 28,100 workers but had sales amounting to an estimated \$2,206,000,000. (W. W. Js.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Kentucky in 1949 and 1950, listing all items with value exceeding \$100,000. Data for 1951 were not yet available. Kentucky ranks second among the states in the production of fluorspar and third in coal, and stands eighth in value of output, with 3.88% of the U.S. total.

Kenya: see BRITISH EAST AFRICA.

Kimball, Dan A. (1896—), U.S. secretary of the navy, was born on March 1 in St. Louis, Mo.

He served as a pilot in World War I and in 1920 went to California where he joined the General Tire and Rubber company. He supervised that company's contracts for such aviation auxiliary material as life rafts and essentials in the field of rocket and jet propulsion. In 1942 he was made director of the Aerojet Engineering corporation at Azusa, Calif., a General Tire subsidiary, and was placed in charge of the development program.

He was named assistant secretary of the navy for air on Feb. 11, 1949, a few months later became undersecretary, and on June 28, 1951, Pres. Harry S. Truman nominated him to be secretary of the navy.

Kimball made an inspection tour of U.S. defense bases in the far east during the spring of 1952, declaring after a visit to Formosa that he would welcome a Chinese Nationalist invasion of the mainland and that the U.S. navy would annihilate any attempt by the Chinese communists to attack Formosa. The U.S. state department, however, denied any official sanction of the invasion of mainland China.

Kimpton, Lawrence Alpheus (1910—), chancellor of The University of Chicago and sixth of its chief executives, was elected on April 12, 1951, and formally inaugurated on Oct. 18, 1951.

Born on Oct. 7, in Kansas City, Mo., he attended public schools there, graduated from Stanford university, Stanford, Calif., in 1931, and took his Ph.D. degree at Cornell university, Ithaca, N.Y., in 1935. That year he was appointed a teacher at Deep Springs school, and in 1936 was named dean and director. In the autumn of 1942, Kimpton became dean of the college of liberal arts and professor of mathematics and philosophy at the University of Kansas City. He joined the Metallurgical laboratory, atomic bomb project at The University of Chicago, as associate chief administrative officer in 1943, and shortly thereafter became chief.

In 1944 he became dean and professor of philosophy and education at The University of Chicago, and on July 1, 1946, was elected vice-president and dean of faculties. He accepted an appointment as dean of students, Stanford university, in 1947, returning to The University of Chicago on Aug. 1, 1950, as vice-president in charge of development, the position he held when elected chancellor.

As chancellor, Kimpton restricted his participation in outside activities to concentrate on the administration of the university. He was concerned educationally with strengthening the position of the humanities as studies whose values are needed in contemporary society. Closer integration between the university and its professional schools, and between the college and the graduate divisions was another administrative area to which he gave attention. He also undertook to bring the budget of the university into balance. Under his leadership, the area in which the university is located organized the South East Chicago commission, to take measures for the protection and stabilization of the community. (W. V. M.)

Table II.—Mineral Production of Kentucky

(Short tons, except as noted)

Mineral	Quantity 1950	Value 1950	Quantity 1949	Value 1949
Fluorspar	661,000	\$ 3,553,000	571,000	\$ 2,903,000
Coal	78,496,000	393,637,000	62,583,000	315,472,000
Fluorspar	80,000	2,555,000	63,000	2,018,000
Fluorspar, pig	754,000	?	627,000	?
Natural gas (000 cu. ft.)	73,613,000	14,443,000	51,851,000	9,888,000
Natural gasoline (bbl.)	244,000	687,000	202,000	595,000
Petroleum (bbl.)	10,381,000	28,650,000	8,803,000	24,300,000
Petroleum gases (bbl.)	1,535,000	1,658,000	1,419,000	1,591,000
Sand and gravel	2,383,000	2,263,000	2,376,000	2,169,000
Clay	7,417,000	8,866,000	7,100,000	8,586,000
Clay	1,000	207,000	1,000	231,000
Other minerals	3,437,000	...	4,475,000
Total		\$459,956,000		\$372,229,000

*Values for processed materials are not included in the totals.

Knowland, William Fife (1908—), U.S. senator, was born on June 26 at Alameda, Calif. After taking his bachelor's degree at the University of California, Berkeley, in 1929, he entered the newspaper business, becoming assistant publisher of the *Oakland Tribune* (Calif.) in 1933. He was a member of the California state assembly from 1933 to 1935 and of the state senate from 1935 to 1939; in 1941-42 he was chairman of the executive committee of the Republican national committee. In 1945 Gov. Earl Warren of California appointed him to the U.S. senate to fill the unexpired term of Hiram W. Johnson. He was elected on the Republican ticket in 1946 for the full term 1947-53 and was re-elected in 1952 for the term 1953-59. He became perhaps the foremost U.S. champion of Chiang Kai-shek and the Chinese Nationalists, opposing the administration's foreign policy in the far east and attacking the dismissal of Gen. Douglas MacArthur. On June 9, 1952, he also defended Pres. Syngman Rhee of the Republic of Korea against charges of political dictatorship, saying that Rhee, like Chiang Kai-shek, had been made a special target for Communist calumny.

Koje-do Riots: see KOREAN WAR; PRISONERS OF WAR.

Korea. Korea is a peninsula extending from Manchuria and the U.S.S.R. southward, 525 mi. long and from 125 to 200 mi. wide. It is bounded on the north by the Yalu and Tumen rivers, on the south by the Straits of Korea, on the west by the Yellow sea, and on the east by the Sea of Japan. Area: 85,225 sq.mi. Population (1951 estimate): about 30,000,000 of which about 21,000,000 were in the Republic of Korea (south of the 38th parallel) and 9,000,000 in North Korea. In Aug. 1951 there were about 3,700,000 refugees in South Korea, who had left their homes because of the hostilities which began on June 25, 1950, with the invasion of South Korea by North Korean troops. More than 400,000 of these refugees came from North Korea.

The capital of the Republic of Korea (South Korea) which was established on Aug. 15, 1948, is Seoul, population estimated at 458,000 in Aug. 1951 compared with 1,640,000 in 1949. As a result of hostilities, Pusan, with a population of about 840,000 (1952 estimate), became the temporary capital. The capital of the Democratic People's Republic of Korea (North Korea), which was established on Sept. 9, 1948, is Pyongyang, with a population of about 500,000.

Major religions: Buddhism, Confucianism, Shamanism and a native religion, Tonghak (Chuntokyo). There were 500,000 Christians in Korea before the war.

History.—The hostilities that began in June 1950 between North and South Korea continued into 1952. Truce talks, which began in mid-1951 between the United Nations command and the Communist forces, also continued into 1952. Although agreement had been reached on 61 out of 62 points in the armistice agreement by mid-1952, the issue of the repatriation of prisoners of war remained unresolved. (See KOREAN WAR.)

Syngman Rhee (q.v.), president of the Republic of Korea since it was founded, was re-elected on Aug. 5, 1952, for a new term beginning Aug. 15. Prior to the election there was a dispute between Rhee and the national assembly, which had the power to elect the president, over whether the constitution should be amended, as suggested by Rhee, to provide for the popular election of the president. Elections that were legally required on or before June 23, 1952, were postponed as martial

law was declared and 13 assemblymen were arrested by the government. The assembly unanimously voted not to adjourn. Government officials explained to it the seizures and arrests. They voted to rescind martial law, such action under the constitution being mandatory upon the government. News reports indicated that on June 3, U.S. Pres. Harry S. Truman sent personal note to Rhee expressing "shock" over the interfeud. On the following day the United Kingdom protested to the Republic of Korea. After boycotts of the assembly various times by various factions, the assembly on July 1, 1952, unanimously adopted four amendments to the constitution. These provided that (1) the president should be elected by popular vote; (2) the national assembly should be reorganized into a bicameral body; (3) cabinet members should be appointed by the president upon the recommendation of the prime minister instead of by the president on his own initiative; (4) the cabinet might be dissolved by a vote of nonconfidence by the assembly.

Prime Minister John Myun Chang, former Korean ambassador to the United States, who was appointed in Nov. 1950, signed in April 1952 and was succeeded by Chang Taik. Vice-speaker of the national assembly and former foreign minister.

An agreement on economic co-ordination between the Republic of Korea and the unified command, representing the United Nations, was signed on May 24, 1952, in Pusan. The agreement, which was negotiated by a special mission headed by Clarence E. Meyer, appointed by President Truman, provided the framework for a joint effort on the part of the two signatories to create economic conditions which would assist the military effort by reducing inflation. A combined economic board was to be established which would develop joint measures for economic stabilization. The U.S. would continue to provide basic supplies for Korea while the Republic of Korea would take internal measures necessary for stabilization.

Between July 1, 1950, and Sept. 30, 1951, the United States government delivered to the Republic of Korea \$150,973,000 worth of supplies for relief and rehabilitation. In addition, the U.S. government provided services valued at about \$200,000,000, such as providing power from power barges and transporting refugees. United Nations member nations, U.N. agencies and U.S. voluntary agencies contributed \$14,853,442 worth of goods in the same period, for a grand total of \$364,927,000.

The premier of the North Korean government in 1952 was Kim Il Sung. (See also UNITED NATIONS.)

Education.—As of June 1, 1952, there were in the Republic of Korea 3,921 elementary schools with 2,525,369 pupils; 563 middle schools with 298,980 pupils; 321 high schools with 140,550 pupils; 49 colleges with 27,500 pupils; 17 normal schools with 20,420 pupils; 7 technical schools with 1,350 pupils; 14 higher technical schools with 3,500 pupils; 1,609 civic schools for adult education with 496,250 pupils.

Finance.—The budget of the Republic of Korea for the fiscal year ending March 31, 1952, amounted to receipts of 1,546,043,000,000 won and expenditures of the same amount. The 1952-53 budget, which was adopted in April 1952, provided for a balanced budget with 2,748,760,000,000 won in receipts and the same amount in expenditures. Currency in circulation increased from 496,000,000,000 won at the end of Oct. 1951 to 600,000,000,000 won at the end of March 1952 and 669,000,000,000 won at the end of June 1952. The retail price index in Pusan (1947=100) rose from 2,997 at the end of Nov. 1951 to 6,373 at the end of June 1952. The official foreign exchange rate was increased from 2,500 won=U.S. \$1 to 6,000 won=U.S. \$1 on Nov. 12, 1951; the black market rate at the end of March 1952 was about 13,500 won=U.S. \$1. At the end of March 1952 foreign exchange in the Bank of Korea totalled \$26,500,000, £12,200,000, and Hong Kong \$756,000. The balance sheet of the Bank of Korea showed assets and liabilities of 1,600,000,000,000 won at the end of May 1952.

Trade.—The Republic of Korea's trade deficit continued into 1952. In 1951, its imports totalled 121,800,000,000 won, excluding U.S.-financed imports, and its exports 49,700,000,000 won. In the first quarter of 1952, imports totalled 51,400,000,000 won and exports 29,200,000,000 won. Japan provided almost three-fourths of the imports and was the destination of more than three-fourths of the exports. Chief imports were manufactured goods such as cotton textiles and fertilizer; chief exports were raw materials. North Korea's trade continued to be chiefly with Communist China and the Soviet Union.

Transportation and Communications.—Korea had in 1952 about 3,500 mi. railroads, with the principal line extending from Pusan to Sinuiju at Manchurian border, connecting Seoul and Pyongyang. In 1951 and 1952 most of the railroad lines, bridges and tunnels of the Republic of Korea that had been damaged during the hostilities were rehabilitated. There were about 21,000 mi. of roads, with the principal highway extending from Pusan to Sinuiju and from Hunyung to Mokpo. On Jan. 1, 1950, the Republic of Korea had 9,700 trucks, 1,000 buses, 2,600 passenger cars and 1,500 taxicabs. Korean National Airways began operations in Nov. 1949 between Kangnung, Kwangju and Pusan but service was suspended because of hostilities. Service was opened in Jan. 1951 between Pusan, Kwangju, Kunsan and Seoul and in March 1952 between Formosa and Korea. Northwest Airlines provided international service to Seoul before the Korean conflict and in 1952 continued to serve Pusan.

In 1949 there were about 38,000 telephone lines, 50,000 telephone lines and 175 telegraph offices in the Republic of Korea.

Agriculture.—Agricultural production in the Republic of Korea in 1951 included rice 56,300,000 bu.; wheat, barley and rye 15,100,000 bu.; beans 4,300,000 bu.; other pulses 500,000 bu.; vegetables 1,100,000 metric tons; fruits 68,000 tons; and tobacco 15,000 tons. At the end of 1951 the Republic of Korea had 393,000 work cattle, 780 dairy cattle, 1,000 horses, 1,000 sheep, 20,000 goats, 91,000 rabbits and 719,000 poultry.

Manufacturing.—North Korea is more predominantly industrial than South Korea with important chemicals, textile, iron and steel, machinery, cement plants, of which many were damaged by the ravages of war in 1950. South Korea's manufacturing industries were primarily for production of consumers' goods. Industrial production in the Republic of Korea in 1951 included: cotton yarn 10,464,810 lb.; cotton cloth 500,000 yd.; woolen textiles 146,112 yd.; rubber shoes 7,011,000 pairs; bicycle and automobile tires 36,857; tire tubes 79,319; paper 5,460 metric tons; cement 6,506 tons; and glass 1,300 tons. Production in the first five months of 1952 included: cotton yarn 6,759,109 lb.; cotton cloth 13,300,000 yd.; rubber shoes 2,459,710 pairs; bicycle tires 8,255; tire tubes 8,068; and cement 7,546 metric tons. The Republic of Korea has a state monopoly on salt, tobacco and ginseng. Salt production in 1951 totalled 81,542 tons; cigarettes 6,411 tons; and cut tobacco 31 tons. Electric power production in 1951 totalled 314,431,000 kw.hr. The first five months of 1952, 229,569,570 kw.hr. were generated.

Mining.—North Korea has the major mineral resources found in Korea with important iron ore, copper, lead, zinc, pyrites, coal and magnesite deposits. South Korea has coal, tungsten, copper, lead, zinc, molybdenum and amorphous graphite deposits. Mineral production in the Republic of Korea in 1951 included (in metric tons): copper 222; tungsten 1,100; molybdenum 4.3; amorphous graphite 15,603; kaolin 4,222; fluor spar 64; anthracite coal 70,817; lignite 50; and gold 0.3. Mineral production in the Republic of Korea increased in 1952 as indicated by the following figures for the first five months (in metric tons): copper 701; tungsten 1,203; molybdenum 3.9; amorphous graphite 3,234; kaolin 270; and anthracite coal 180,078. There were also produced in this five-month period 5,162 tons of manganese, 5,424 tons of iron ore, 30 tons of cobalt, 500 tons of columbite and 150 tons of beryl.

Korean War. Communist ground action during the second winter campaign (1951-52) of the Korean War was characterized by widely scattered exploratory attacks, usually delivered at night and utilizing small units from squad to battalion in size. During 1952 the Communists continued to increase the amount of artillery directed at United Nations troops. In the latter part of the year on several occasions as many as 50,000 rounds of mortar and artillery fell on U.N. troops in one day.

United Nations command ground actions were limited to combat patrolling and probing attacks varying from squad to battalion in size. The Communists were determined to contain U.N. thrusts, and even reconnaissance patrols met immediate resistance accompanied by increasing amounts of mortar and artillery fire. Ever since the front lines had been stabilized in Nov. 1951, a constant battle for observation had occurred. In the second period of 1952, the Korean summer-fall campaign (May 1-Nov. 1), the battle for the peaks became particularly intense. Opposing front lines were as close together as 50 yd. in some places and as far apart as 10 mi. in others. Battle positions ran along ridge lines offering good observation of the enemy territory. It was for possession of these high mountains protruding into the enemy's lines that the fighting was most intense.

Mountains were named by the front line troops and by newsmen. Stubborn fighting and seesaw actions, with one side gaining control and then being pushed off, caused these impor-

tant terrain features to change hands many times. In the battle for the hills, the 1st marine division on Bunker hill, the 3rd infantry division (including the Belgian and Greek battalions) on Big Nori and Kelly hill, the 2nd infantry division (with the French battalion) on Old Baldy and Arrowhead ridge, the 9th R.O.K. division on Whitehorse mountain, the 7th infantry division on Triangle hill, the 2nd R.O.K. division on Sniper ridge, the R.O.K. capitol division on Finger ridge and Capitol hill, the 25th infantry division (including the Turkish brigade) on Heartbreak ridge and the 8th R.O.K. division in the Punch Bowl area were featured in the news accounts.

The accuracy of the U.N. artillery and the close air support of U.N. aircraft helped a smaller number of troops hold off many times larger numbers of Communist infantry in their attempts to win and hold the contested observation points. South Korean troops, well led and trained, fought in some of the most savage fighting occurring in their areas during 1952.

Air Action.—Communist air activity (and aggressiveness) during 1952 varied from month to month. In January, for example, little activity was reported, but in February total MIG-15 sightings were more than 3,500. About 600 of these sightings resulted in air-to-air encounters, and the F-86s accounted for 51 MIGs destroyed or damaged that month. In September 61 MIGs were destroyed, 7 probably destroyed and 57 damaged. The scene of most of the encounters was "MIG alley" in northwest Korea from the Yalu river south to Pyongyang. U.N. F-86 aircraft continued to take a high toll of MIG-15 interceptors which rose to challenge low-level attacking fighter bombers and were thus forced to engage the F-86s flying protective cover. Since the first appearance of the Russian-built MIG-15 in aerial combat, U.N. F-86s had destroyed more than nine MIGs to every F-86 lost in air-to-air engagements.

Stabilization of the battle line lessened the need for close air support, and U.N. aircraft concentrated on the systematic destruction of Communist supply and communication facilities behind the front lines. U.N. fighter bombers, escorted by F-86s, conducted daytime raids against rail lines, rolling stock and trucks, restricting the Communists from transporting men and equipment by day. In some areas, Communist railroad lines had to be discontinued as constant interdiction made repairs impracticable.

In Oct. 1951 the B-29s in the far east air forces bomber command switched largely to nighttime operations. Targets for the B-29s during 1952 were Communist transportation facilities, storage areas and marshalling yards, plus close-support night missions for U.N. ground forces. The B-29s systematically neutralized the Communist airfields in North Korea, making them useless to the Reds.

During the latter part of 1952, as ground action by both sides increased, U.N. close-support aircraft which had been shifted to

Table I.—Summary of Air Action in Korean War to Oct. 25, 1952

Communist Aircraft Losses				
	Destroyed	Probably destroyed	Damaged	Total
MIG-15	475	85	660	1,220
All types (including MIGs)	631	112	749	1,492
U.S.A.F. Aircraft Losses				
	Air-to-air	Ground fire	Other causes	Total
Jet	72	200	47	319
Propeller	17	273	44	334
Total	89	473	91	653
Other U.N. aircraft	6	49	14	69
Shore-based marine aircraft	0	61	29	90
Grand total	95	583	134	812

Destruction Claims (in round figures)			
Item	U.S.A.F.	Attached units*	Total
Sorties flown	525,200	80,300	605,500
Vehicles destroyed	53,650	6,850	60,500
Rail cars destroyed	7,850	900	8,750
Bridges destroyed	560	230	790
Tanks destroyed	1,140	130	1,270
Tunnels	770	150	920
Troop casualties inflicted	144,000	34,000	178,000

missions in the rear of the battle line during the lull in ground fighting were returned to close support of front line troops.

Naval Action.—Naval combat action in 1952 was supplied by carrier-based planes from the fast carrier task force on the east coast and the west coast carrier group; by surface ships and aircraft blockading the east coast of Korea from the bomb line to Chongjin; and by fire-support vessels providing gunfire for front line units. By the end of Oct. 1952, the 4 battleships, 8 cruisers and approximately 80 destroyers which had at one time or another participated in the Korean war had fired approximately 4,000,000 rounds of projectiles varying from 16-in. to 3-in. at Communist targets. Throughout 1952 a continuous siege was conducted of Wonsan on the Korean east coast.

Sixteen aircraft carriers had been in operation off the Korean coasts during the war: 13 U.S., 2 British and 1 Australian. Throughout 1952, sustained ground interdiction was maintained and coastal, rail and highway routes were cut repeatedly day and night. Land-based marine air squadrons attacked Communist troops, gun positions and transportation in the rear areas of North Korea.

Armistice Negotiations.—The Korean armistice negotiations first proposed by Jacob Malik, Soviet representative on the Security Council, in a radio address on June 23, 1951, actually got under way at Kaesong, Kor., on July 10, 1951. On July 26, 1951, the agenda had been agreed upon as follows: (1) adoption of agenda; (2) fixing a military demarcation line between both sides to establish a demilitarized zone as a basic condition

for a cessation of hostilities in Korea; (3) concrete arrangements for a cease-fire and an armistice, including the composition and authority and functions of a supervisory organization; (4) arrangements relating to prisoners of war; and (5) recommendations to the governments of the countries concerned both sides. After agreement on item 1, final agreement on item 2 was achieved on Nov. 27, 1951, when it was agreed that existing lines of contact between the two sides should be the demarcation line for an armistice agreement if it were signed within 30 days. (Since no agreement was reached, the demarcation line was to be based on the line of contact at the time of the signing of the armistice.) A four-kilometre demilitarized zone between the military forces was also agreed upon to minimize incidents which might arise to cause a resumption of hostilities.

On item 3 (arrangements for carrying out the cease-fire) United Nations command proposals contained the following principles: (1) cease-fire to be effective within 24 hours after the signing of the armistice; (2) a supervisory organization to be established to carry out the supervision of the terms of the armistice; (3) access to all of Korea by armistice commission and its observation teams; (4) withdrawal by each side from the territory controlled by the other; and (5) withdrawal of all armed forces from the demilitarized zone.

In addition, the U.N. command felt that during an armistice there should be some rotation and replenishment of troops, and that there should be restrictions on the construction of airfields—no military and a minimum of civilian airfields. The Communists rejected any restriction by a conference on a build-up in military strength, stating that this proposal constituted interference in the internal affairs of each side. They also demanded the right to build up their air potential during the armistice by constructing military airfields.

Disagreement arose when the Communists did not agree with U.N. negotiators who believed that the broadest possible access to all parts of Korea would be necessary for inspection in order to ensure against increases in the military strength. In the compromise agreed upon, inspection teams were to be stationed at five points of entry on each side and there were to be in addition ten mobile teams to investigate violations.

More controversy arose when the Communists opposed a provision for the rotation of troops. The compromise finally agreed to was that 35,000 men could be rotated monthly on each side.

Initially, the U.N. command had proposed that inspection be by joint teams from both sides, but the compromise proposal which was finally agreed to was an inspection by observers of neutral countries acceptable to both commands. When the Communists proposed the U.S.S.R. as a neutral nation the U.N. was unable to agree. Thus at the beginning of Nov. 1952, two points remained unagreed upon in regard to agenda items 3 and 4. These were airfield construction and the composition of the neutral supervisory organ.

Concurrently with discussions on item 3, subcommittees of the armistice delegations began discussions on item 4 in Dec. 1951 pertaining to prisoners of war. Prisoner of war lists which the United Nations command had from time to time submitted to the International Committee of the Red Cross totalled approximately 170,000 names. Of this list, approximately 37,500 persons had been erroneously classified as prisoners of war and were subsequently removed from the list, reclassified as civilian internees and released. When the Communists finally agreed to the exchange of the names of prisoners of war, the United Nations submitted a list containing approximately 132,000 names. When later investigation, an additional 11,000 persons were also reclassified as civilian internees and thus subject to release. The Communists were then informed that about 121,000 persons were under U.N. control in various prisoner of war camps in South Korea and on Koje-do.

The Communist list included approximately 11,500 U.N. and R.O.C. prisoners. This number was in conflict with the official announcement by the Communists that they had captured 65,000 prisoners in the first months of hostilities. The Communist explanation was that large numbers of these personnel had been re-educated and released at the front where many of them joined North Korean forces, and that they had been unable to obtain the names of these persons.

On Jan. 2, 1952, the United Nations presented its proposal for exchanging prisoners of war, interned civilians and displaced persons who provided for an "all for all" exchange on a basis of individual choice. It provided for the release of all prisoners of war (including soldiers who might have been incorporated into the armies of the detaining power) and permitted freedom of choice on the part of each individual to accept or reject repatriation. The Communists refused to consider the principle of voluntary repatriation and the inclusion of civilians in exchange. They asserted that the principle of voluntary repatriation was a violation of the Geneva convention. The U.N. command replied that it would consider any plan or proposal for settling the prisoner of war question with one exception: that it would not forcibly repatriate prisoners of war.

By Feb. 15 agreement on eight provisions of the draft referring to prisoners of war had been virtually achieved. By March the subcommittee had finally agreed to the following: (1) return of seriously sick and seriously injured prisoners of war; (2) a place of delivery of prisoners; (3) a committee for repatriation of prisoners; (4) organization and functions of the joint Red Cross team; (5) exchange of data on escaped and deceased prisoners of war and displaced civilians; (6) permission for Korean civilians and foreign civilians to return to their homes on either side of the demarcation line.

At the conclusion of executive sessions on April 2, which had been suggested by the U.N. negotiators in the hope of expediting a solution

Right: CREST OF "OLD BALDY," near Chorwon on the western front in Korea, lit up by artillery, rockets and mortars as U.N. and Communist forces trained their fire on the bitterly contested mountain. It was in U.N. hands by Sept. 21, 1952, the Communists having been driven off for the second time since midsummer

Centre, right: COMMUNIST PRISONERS of war who were identified by an escaped fellow inmate as being members of a "people's court" which sentenced him to death as an anti-Communist. They are shown being removed from compound 506 on Kojedo in June 1952

"... AND DON'T ASK ME what it's all about, lads! ... all I know is nobody can win it, lose it or stop it! ..." This cartoon by Lichty of the Chicago Sun-Times Syndicate was published in 1952

the Communists suggested that the two sides begin at once the work of checking the lists of prisoners of war to be repatriated, and that the discussions be resumed after the check. The closed session of the staff officers of the two sides was resumed on April 19 when the Communists asked the U.N. for the totals of the prisoners of war and learned that the U.N. command anticipated that approximately 70,000 prisoners of war in its custody in the Republic of Korea would return of their own choice.

The screening program designed to determine the number of North Korean and Chinese prisoners of war who could not be returned to Communist control without the use of force was conducted in the following manner:

After a complete explanation as to the significance of the program and the interviews, unarmed United Nations command personnel stationed near the entrance to each compound called individually and interviewed privately each of the prisoners and civilian personnel. Each prisoner or civilian was asked first, "Would you like to return to China (or North Korea)?" If the answer was "yes" the prisoner was listed for repatriation without further question. Those who replied in the negative were asked additional questions to determine whether their opposition was nominal or whether they would violently oppose repatriation.

As a result of the screening of the prisoners of war and civilian internees, approximately 70,000 were listed for repatriation. No attempt was made to screen the prisoners of war in Communist-dominated camps which had refused to co-operate. However, since the Communists pressed for an early reply on a round number, U.N. figures of 70,000 included all prisoners of war who were interviewed and indicated they would not resist repatriation plus an estimate of the unscreened prisoners. When the complete screening job was finished, the results indicated that a total of approximately 83,000 (76,000 Koreans and 6,400 Chinese) could be repatriated without the use of force.

The Communists refused to recognize the results of the screening of the prisoners by the U.N. command and stated that it was unthinkable that their captured personnel did not wish to be returned. They cited article 118 of the Geneva convention as the reason for their position: "Prisoners of War shall be released and repatriated without delay after cessation of hostilities." The U.N. command, however, pointed out to the Communists that forcible repatriation was not consistent with the humanitarian basis of the Geneva convention and thus the spirit of the convention. In addition the U.N. command quoted article 6, which provided that no special agreement should adversely affect the situation of prisoners of war as defined by the convention or restrict their rights.

After a great deal of negotiation on the subject of forcible or non-forcible repatriation, the U.N. negotiators on April 28 offered the Communists a "package" proposal for solving the three issues still in dispute. They proposed that (1) there should be no forced repatriation of prisoners of war, (2) the United Nations command would not insist on prohibiting reconstruction and rehabilitation of airfields and (3) the U.N. command agreed to accept Poland and Czechoslovakia as members of the neutral nations supervisory commission if the Communists agreed to Sweden and Switzerland (thus withdrawing their demands for the inclusion of the U.S.S.R.). This proposal had to be accepted in whole and not in part, and as of Nov. 1, 1952, the proposal still remained

open. In the next few months of fruitless negotiations, the U.N. indicated to the Communists time and time again that while the issue of non-forcible repatriation was vital, it was prepared to accept any reasonable suggestion for resolving the deadlock.

The U.N. command negotiators had proposed on April 23 that joint Red Cross teams from both sides be admitted to prisoner of war camps on both sides, to verify the fact that none of the repatriates would forcibly resist return to the side from which they came. The Communists rejected the proposals. On Sept. 28 the U.N. put forward three alternative proposals to meet Communist objections to the principle of non-forcible repatriation and the allegations that the previous screening was unfair. In essence these proposals provided for different ways by which impartial screenings could be held by both sides to determine the desires of the various prisoners of war. When the Communists rejected these proposals, the U.N. command called a recess to the negotiations on Oct. 8.

As to item 5 of the agenda (recommendations to governments of countries concerned) the original Communist proposal was that within three months after the effective date of armistice the governments concerned would appoint five representatives from each side to hold a conference. The conference was to take up the withdrawal of all foreign forces from Korea, the peaceful settlement of the Korean question, and "other questions relating to the war in Korea."

In a counterproposal the U.N. recommended for consideration the withdrawal of non-Korean forces from Korea, a peaceful settlement of the Korean question, and other Korean questions relating to peace. The U.N. believed it was not proper for the armistice negotiators to recommend the size, nature and makeup of the suggested political conference. In an agreement reached on Feb. 19, the U.N. delegation accepted a revised Communist proposal recommending that within three months after the armistice a political conference of a higher level from both sides be held by representatives appointed respectively to settle, through negotiation, the questions of withdrawal of all foreign forces from Korea, the peaceful settlement of the Korean question, etc. In accepting the wording, Adm. C. Turner Joy pointed out that the term "foreign forces" meant non-Korean forces and that the U.N. negotiators did not construe the word "etc." to relate to matters outside Korea. Thus the troublesome matter of the fifth point in the agenda was settled with a minimum of difficulty.

Koje-do Incident.—After the Inchon landing and the breakthrough almost to the Manchurian border in Oct. 1950, a large part of the Korean Communist army had been destroyed or captured together with large numbers of Chinese. U.N. forces had captured more than 100,000 North Koreans and Chinese People's volunteers and had placed them in South Korea and on the islands off the tip of the peninsula, principally Kojedo. Included among the prisoners was a hard corps of Communists which at once began organizing the various prisoner compounds and making a great deal of trouble for their United Nations captors.

The International Committee of the Red Cross, in accordance with the provisions of the Geneva convention of 1949, had been allowed access to, and information about, all the prisoners of war taken by U.N. forces and the conditions under which these prisoners were living.

On Feb. 18 a riot of Korean civilian internees occurred in a compound on Kojedo. About 1,500 of the 5,000 inmates joined in the disturbance; 1 U.S. soldier and 69 inmates were killed. Another outbreak occurred on March 13 involving Korean Communist prisoners of war. By the time the riot had been quelled, 12 Communist prisoners of war were dead and 26 wounded.

A long period of disorders and demonstrations reached its climax on May 7 when prisoners seized Brig. Gen. Francis T. Dodd, the U.N. commander on Kojedo. The leaders in the compound then issued a set of demands which specified the conditions under which Dodd would be released. The acting commander of Kojedo, Brig. Gen. Charles F. Colson, acquiesced to the prisoner of war demands and issued a ransom note which the Communists construed as admitting the guilt of the United Nations command to certain Communist allegations of abuse and mistreatment. Gen. Mark W. Clark, who had succeeded Gen. Matthew B. Ridgway on May 12, immediately refuted the contents of the ransom note and pointed out the unprecedented and illegal method used to obtain the note.

Shortly after this incident, a new commander, Brig. Gen. Haydon Boatner, was appointed on Kojedo, and a large program was begun to segregate the prisoners and to place them in compounds considerably smaller than those in which they had originally been held. Other incidents occurred, but order was promptly restored by U.N. troops according to the Geneva convention.

Table II.—Report of U.S. Casualties in Korean War through Oct. 24, 1952

	Army	Navy	Marine corps	Air force	Total
Total casualties	97,225	1,679	23,193	1,298	123,395

Forces Involved in the War.—Communists.—Army: More than 1,000,000 men, largely Chinese Communist forces, were deployed in Korea in 1952. These men were organized into well-equipped divisions with supporting artillery, tanks and heavy equipment. Air: The Chinese air force consisted of more than 2,000 planes, mostly jets, based on Manchurian fields near the Yalu river. Navy: There was no Communist navy in Korean waters in 1952.

U.N. Forces.—On May 12, 1952, Gen. Mark W. Clark succeeded Gen. Matthew B. Ridgway, United States army, as commander in chief of the United Nations command.

Army: Under the leadership of Gen. James Van Fleet, the U.S. 8th army, organized into 18 combat divisions, with supporting units, tanks and artillery, faced the numerically superior Chinese Communist forces. The army of the Republic of Korea consisted of ten infantry divisions (including South Korean marines) which at full strength were approximately 10,000 men each, plus supply and labour units and rear area security forces. Total participation by Korean military forces was greater than 400,000 men. The following U.S. divisions had taken part in the Korean war: 1st cavalry, 2nd, 3rd, 7th, 24th, 25th, 40th, 45th and 1st marine divisions. Seven U.S. divisions were in Korea on Oct. 31, 1952. The 1st commonwealth division consisted of troops from England, Australia, Canada and New Zealand. This division and smaller units from a number of other U.N. countries had made a substantial contribution to the United Nations command army.

Navy: Naval units from the United States and ten other United Nations countries had participated in: (1) complete blockade of both coasts to deny the use of the sea routes to the Communists and (2) coastal bombardment and air strikes to destroy enemy supply lines.

Air force: U.S. air force, U.S. navy and U.S. marine corps aircraft of all types, as well as aircraft of seven other nations, had participated in the Korean war. Bombers, fighter bombers, fighters and reconnaissance aircraft, as well as cargo aircraft, had participated in the war. A figure indicative of the number of aircraft involved could be obtained from one day's operations with all far east aircraft mounting 1,525 sorties. This was the greatest number of sorties flown in one day in the Korean war up to Oct. 31, 1952. (See also ARMIES OF THE WORLD; AVIATION, MILITARY; PRISONERS OF WAR.) (C. V. C.; G. S. Bd.)

Labour Unions. **United States.**—In the United States the year 1952 was one of high level employ-

ment, of wage increases which averaged slightly more than the increase in the cost of living, of continued improvement in various benefits and of struggles and tensions with respect to wage stabilization which resulted in several serious work stoppages and a total of man-days lost which it appeared might be higher than for any post-World War II year except 1946. Union membership increased only slightly despite the continued spread of "union shops" in various industries and plants.

Employment and Earnings.—As of Sept. 1952 nonagricultural employment had risen to 54,712,000 from 53,540,000 in January. Unemployment declined from 2,054,000 in January to 1,284,000 for the week ended Oct. 11. The unemployment which remained, of minimum proportions, was not concentrated in any particular industries. (See also EMPLOYMENT.)

Typically, the wage increases negotiated in 1952 were smaller than in 1951 and the proportion of renegotiations without wage increases was greater. For the manufacturing industries as a whole, straight-time average hourly earnings increased from \$1.58 in January to only \$1.62 in August. Wage settlements made in the later months of 1952, generally within a range of 4 to 12 cents per hour, portended an average increase for the full year of about 6 cents per hour, about half that of the previous year. However, the wage increases in 1952 were not substantially offset by increases in living costs. While there were slight fluctuations from month to month, the increase in the consumers' price index for the year as a whole would probably be restricted to about two points. There were, in addition, further increases in 1952 in the variety and amounts of pension, vacation and other benefits. (See also BUSINESS REVIEW.)

Wage Stabilization and Industrial Disputes.—The Wage Stabilization board, which in 1951 had been empowered to handle disputes as well as to establish stabilization policies, found itself in the centre of negotiations where its established policies did not lead to settlements within their terms. The outstanding disputes testing wage stabilization policies were in steel and coal. Other disputes of national concern occurred in the petroleum and telegraph industries and in several aircraft plants.

The steel dispute turned into a test of stabilization policies, brought to a head the question of the president's inherent power to seize an industry without congressional authorization if in his judgment this was necessary to protect the national safety, and again stimulated interest and controversy as to the handling of national emergency disputes. The secretary of defense had testified that the schedule of war production and the needs of the armed forces were such that the cessation of production of steel for any prolonged period of time would be catastrophic. Yet an estimated 20,000,000 tons of steel were lost during the 54-day stoppage before work was resumed at the steel plants. The president's power to seize industries under these conditions was restrained by the supreme court, but the emergency provisions of the Taft-Hartley act were not invoked because the president was of the opinion that he had already obtained more than the equivalent by other means. After further presidential intervention the dispute was finally settled on lower terms in

IDLE ENGINES in Chicago, Ill., during a strike by 5,000 railroad workers which halted service on the N.Y. Central system west of Buffalo, N.Y., March 9-12, 1952. Steam was kept up in the engines in hopes of a rapid end to the walkout

wages and other benefits than had been recommended by the Wage Stabilization board, and with provisions for escape from the union shop.

A stoppage of several days in the bituminous coal industry followed a decision of the Wage Stabilization board that the \$1.90 per day increase negotiated between the United Mine Workers and the operators exceeded the increase permitted by wage stabilization policies. An increase of \$1.50 per day was allowed by the board. The provision in the contract to raise the royalty rate from 30 cents to 40 cents a ton for the welfare and retirement fund was not changed, as approval for this increase was not required. The men returned to work after the president agreed to submit the case to the director of economic stabilization for review. The agreement between the operators and the union and the general steadiness of prices in general seemed to presage a disposition to permit collective bargaining to take its course. (See also WAGE STABILIZATION BOARD.)

Union Membership; the Union Shop Issue.—Very little, if any, gains were made in total union membership in 1952. In the first six months of 1952 no-union ballots in elections conducted by the National Labor Relations board won in 32% of the cases compared with 28% during the previous year. However, some increases in membership continued to come via the route of representation elections. Some increase in American Federation of Labor membership was accounted for by the transfer of the hosiery workers union and sections of textile workers and insurance employees from the Congress of Industrial Organizations. Organization drives among textile, department store and white collar workers had not met with much success. On the whole, the C.I.O. possibly suffered some losses in membership.

The year witnessed the further spread of the union shop in various industries and plants. The rejection by representatives of the steel industry of the union shop recommendation of the Wage Stabilization board prolonged the steel strike until a compromise was reached. The terms finally agreed upon permitted new employees to withdraw between the 16th and 30th day of employment; union members could drop their membership during the last 15 days of the new contract if they so desired; employees who were not members were not required to join the union.

In the railroad industry, the recommendation of a presidential emergency board that union-shop contracts be granted was accepted by the employer association representing eastern railroads, but the western and southern railroad management groups refused to agree to a full union shop. Modified union shop proposals based on the General Motors or the new steel versions were not accepted.

Organized Labour and the Presidential Campaign.—Both the A.F. of L. and the C.I.O., their political action auxiliaries, and many national unions endorsed the candidate of the Democratic party and worked on his behalf. The candidates of both major parties addressed the A.F. of L. convention which met during the period of the presidential campaign. The results of the campaign were not conspicuously successful. Not only was the Republican candidate victorious by a vote so large and so distributed as to compel the conclusion that large numbers of union members and their families had voted for him, but also more members of the house of representatives and senate were returned than defeated among those who had poor ratings in the tabulations of voting records made by unions. The elections were generally regarded as a setback to the claim that union members vote as a unit and that they follow union leadership in a political campaign.

At the year end the most practical question for unions growing out of the election was the fate of the Taft-Hartley act. (G. PK.)

Philip Murray, president of the Congress of Industrial Organizations, and William Green, president of the American Federation of Labor, both died late in 1952. Walter P. Reuther, head of the C.I.O.'s United Automobile Workers, was elected to succeed Murray, and George Meany, formerly secretary-treasurer of the A.F. of L., was elevated to the presidency of that organization. (X.)

Canada.—According to the 41st annual survey of the federal department of labour, there were 1,146,121 trade unionists in Canada on Jan. 1, 1952 (1,028,521 on Jan. 1, 1951); more Canadian workers were members of unions than at any other time. The membership was divided as follows: Trades and Labour congress, 522,965; Canadian Congress of Labour, 330,778; Canadian and Catholic Confederation of Labour, 89,013; International Railroad brotherhoods, 41,385. The remainder were international unions not affiliated with any Canadian congress, and national and regional unions not so affiliated.

There was remarkable unanimity among the big four labour groups in their presentations to the federal cabinet: for instance, they all demanded some form of restriction on immigration, reimposition of price controls, lower taxes, increased unemployment insurance benefits, higher old-age pensions and lower qualifying age and fewer importations of foreign goods.

For the first time in the history of Canadian combines legislation, members of a trade union were named as a combine: 13 members of a Winnipeg bakery union were found parties to illegal measures to control Winnipeg bread prices. In British Columbia a court fined a union official and 15 union members for grave contempt and failure to recognize union responsibility: the International Woodworkers of America had refused to obey a court injunction to stop picketing a boat being loaded with lumber. A board of arbitration awarded the Canadian General Electric company \$9,208 damages against the United Electrical workers union for loss incurred by the company during a wild-cat strike. (C. Cv.)

International Movement.—The total membership of the I.C.F.T.U. (International Confederation of Free Trade Unions) in 1952 was 53,000,000 in 70 countries, an increase of about 1,000,000 over the previous year.

The regional organization of the I.C.F.T.U. was further developed; the goal of £250,000 for which an appeal had been made in 1951 to carry out this work was reached early in 1952. In addition to assisting trade unions to become securely established, the regional fund provided the means for the setting up in Calcutta of an I.C.F.T.U. residential college for the training of trade union officers; this was opened in Sept. 1952. Preparations were also made for the establishment of training schools in Singapore, Accra (Gold Coast) and in Abidjan (French West Africa), and there were plans to commence preparations for training schemes in the Arabic-speaking countries of the middle east. The European regional organization gave special assistance to the non-Communist Italian and French trade union movements. In Feb. 1952, it convened a European Trade Union Conference on Housing which was attended by more than 80 delegates, observers and housing experts from international organizations; on the recommendation of the conference a permanent committee on housing was established.

The I.C.F.T.U. continued its work in defense of trade union rights; it submitted detailed evidence of the violation of trade union freedoms in Venezuela and Argentina to the I.L.O. (International Labour organization) and the Economic and Social council of the United Nations and supplemented previous evidence given to the council on the prevention of free trade unionism by the government of the U.S.S.R. After sending an observer to Tunisia, the I.C.F.T.U. vigorously interceded with the French government in support of the demands of the Gen-

al Confederation of Labour of Tunisia.

The first meeting of the I.C.F.T.U. general council was held in Berlin, Ger., July 1-5, 1952. The American Federation of Labour refused to send delegates to this meeting in protest against what it regarded as unsatisfactory aspects of the I.C.F.T.U. From the foundation of the I.C.F.T.U. the A.F. of L. desired it to pursue a more militantly anti-Communist policy than other trade union centres thought wise. Dissatisfaction came to a head when Sir Vincent Tewson, secretary of the British Trades Union congress, accepted nomination and was elected president of the I.C.F.T.U., following the resignation of Paul Robeson in 1951. The acceptance of this post by Sir Vincent Tewson was regarded by the A.F. of L. as a violation of an alleged gentlemen's agreement that neither the A.F. of L. nor the T.U.C. should hold the senior office in the I.C.F.T.U. Immediately prior to the meeting of the I.C.F.T.U. general council Sir Vincent Tewson and J. H. Oldenbroek, I.C.F.T.U. secretary-general, visited the U.S. to confer with the leaders of the A.F. of L. and attempted to resolve the difficulties.

Great Britain.—After a slight decline in each of the two previous years, the affiliated membership of the British Trades Union congress (T.U.C.) for the first time exceeded 8,000,000, rising from 7,827,000 in 1951 to 8,020,000 in 1952.

R. A. Butler, the first Conservative chancellor of the exchequer after World War II, continued the practise of his Labour predecessors and received a delegation from the T.U.C. to air their views on fiscal and economic problems. The suggestions of the T.U.C. were that food subsidies should be increased; charges for national health service prescriptions should be withdrawn; the standard rate of income tax and the tax on unearned incomes should be increased, while the lower rates of tax should be reduced; the profits tax should be increased; a statutory limitation of dividends introduced; and a tax on capital gains imposed. In the event the chancellor adopted only one of these suggestions, they preferred an alteration in the number rates of tax. In a statement approved by the general council on March 26, the T.U.C. sharply criticized the budget and the assumptions on which they claimed it rested—notably that there would be some increase in unemployment and a rise in prices—and issued a warning that in the circumstances the trade unions would be compelled to press for higher wages. Following publication of this statement, the chancellor again met representatives of the T.U.C. and suggested that wage increases should be linked to productivity. As a result of further discussions with the chancellor and the obvious seriousness of the economic situation, the general council issued a lengthy report to the congress, which after reviewing Britain's economic difficulties concluded that substantial wage increases would be found to raise costs in the export trades but refused to countenance any interference with traditional methods of wage determination.

The economic policy of the general council was put to the annual congress, held in September, in the form of its report, supplemented by a resolution moved by the Union of Shop Distributive and Allied Workers and supported by a number of other large unions; this resolution, while criticizing severely the government's economic policy, was carried together with the report of the general council by votes of 7,771,000 to 39,000 and 6,856,000 to 504,000, respectively, and was clearly understood to commit the trade union movement to a policy of moderation in wage claims.

Another triumph for the general council was in the heavy defeat by the congress of attempts to reject its support for the armament program. Two resolutions which had been supported by Communist delegates were defeated by 6,941,000 to 887,000 and 6,075,000 to 1,801,000. An amendment to the sec-

ond resolution, which was generally thought to state the policy associated with the name of Aneurin Bevan, was also heavily defeated by 5,801,000 to 1,272,000; thereafter the general council's report in favour of rearmament to the maximum extent consistent with economic stability, was carried by 5,597,000 to 1,450,000.

An event of outstanding importance during 1952 was the dismissal of an employee after 31 years' service by D. C. Thompson, Ltd., because it had come to their notice that he was a member of a trade union. This was followed by a strike of 74 fellow employees who were called out by the National Society of Operative Printers and Assistants to which they also secretly belonged. The strike was supported by a nation-wide boycott of Thompson's by other trade unions, the members of which refused to handle supplies of paper destined for the firm's printing offices. As a result D. C. Thompson, Ltd., sought an injunction against Arthur Deakin, general secretary of the Transport and General Workers union and several other trade union officials, on the grounds that they had procured a breach of contract on the part of the Bowater Paper Corporation, Ltd., who were principal suppliers of paper to D. C. Thompson, Ltd. Justice Upjohn dismissed the motion because the facts did not, in his judgment, give rise to an intention on the part of the trade union leaders to procure directly a breach of contract; they were entitled under section 3 of the Trade Disputes act, 1906, to act as they had done without committing a tort.

In the meantime the minister of labour had instituted a court of inquiry into the dispute, his attention having been previously drawn by the T.U.C. to the I.L.O. convention 98, which had been ratified by the British government. This convention protects workers from being discriminated against by employers because they want to join a union, already belong to a union or refuse to relinquish membership of a union. The report of the court of inquiry, published on July 11, viewed with misgiving the attitude of D. C. Thompson, Ltd., and called upon them to reconsider their policy of refusing to employ unionists; at the same time it suggested to the trade unions that they would be well advised to consider the wisdom of disrupting industry and bringing hardship on the public by pressing their demands.

During the year the Anglo-American Council on Productivity, on which the trade unions of both Great Britain and the United States had been represented together with management from both countries, was wound up. In all, 47 teams and 19 specialist groups had been sent to the United States during the lifetime of the council, and by the end of the year most of them had published their reports. Lacrosse. Rensselaer Polytechnic institute and the University of Virginia were named co-champions of the National Intercollegiate Lacrosse association in 1952, and shared the Wingate trophy, symbolic of national honours. Rensselaer, playing mostly northern teams, swept through ten games unbeaten, concluding its campaign with a 23-1 victory over Williams college. Virginia numbered among its victims some of the strongest tens in the game including Maryland, Navy, Johns Hopkins and Princeton, although the Cavaliers lost to the Mount Washington Lacrosse club of Baltimore, Md., which again was the United States open title winner. Mount Washington Lacrosse club closed its regular season unbeaten by turning back a strong Army unit, 14-8, for its ninth triumph.

The annual north-south all-star contest was held in New York city for the first time. Played at the Polo Grounds for the

benefit of the Damon Runyon Cancer fund, the contest drew more than 5,000 fans and resulted in a 15-7 decision for the south. Virginia's Dick Godine and Gordon Jones, with four goals apiece, starred for the winners and helped give the south its first victory in three years in the series. Joseph Austin, Army inside home, tallied three times to lead the north in scoring.

Philadelphia again retained its title in women's lacrosse, both its first and second teams going undefeated in the three-day national championship tourney at Weston, Mass. Philadelphia placed eight of its stars on the all-United States first team picked at the competition, which closed on June 1 when the U.S. first 12 routed the U.S. reserves, 12-2. Lois Linton of Philadelphia and Ann Delano of Boston each tallied three goals.

Latin-American Literature.

Literary creation in Mexico during 1952 reflected a situation which appeared to be prevalent throughout Latin America and perhaps the entire world. On the one hand there was a strong nationalist trend expressed in a torrent of essays and psycho-sociological analyses; while on the other hand the lyrical evasiveness, romanticism and fantasy which pervaded numerous poems and short stories constituted an opposite trend, even a reaction to this nationalist spirit.

The first 10 volumes of a projected 100-volume series entitled "Cultura Mexicana," sponsored by the National University of Mexico, Mexico City, appeared. Included were such excellent studies as *El folklore de México* by Angel María Garibay, *Estudio sobre México* by Jesús Silva Herzog, *Perspectivas de la industrialización en México* by Manuel German Parra and *Panorama fiscal de México* by Hugo Margain. The National Financiera began its projected 40-volume series entitled "La Estructura Social y Cultural de México," with José E. Iturriga's book bearing the same title as the series, and *La pesca* by Alejandro Quesada. Art and archaeological studies reached full maturity with *Arquitectura prehispánica* by Ignacio Marquina Barredo; *Folklore de San Pedro Piedra Gorda* by Vicente T. Mendoza and Virginia R. de Mendoza; and the third volume of a "History of Mexican Art," Justino Fernández' *Arte moderno de México*, which was as erudite and definitive as the two preceding volumes: Salvador Toscano's *Arte precolombino de México y la América Central* and Manuel Toussaint's *Arte colonial en México*. An extraordinary series "México y lo mexicano" was edited by the gifted philosopher Leopoldo Zea, who added two volumes a month to the series. From the six titles published by late 1952 (*La x en la frente* by Alfonso Reyes, *Conciencia y posibilidad del mexicano* by Leopoldo Zea, *Mito y magia del mexicano* by Jorge Carrión, *Análisis del ser del mexicano* by Emilio Uranga, *Cornucopia de México* by José Morena Villa and *El amor y la amistad en el mexicano* by Salvador Reyes Nevárez) the amplitude and earnestness of the plan was evident: the viewpoints were varied but the keenness and sincerity of analysis were the same—all were engaged in the same passionate quest of Mexican quintessences.

One might expect that creative activity would be imbued with a similar spirit, the spirit of the realistic novel of the Mexican Revolution. This was not so. The most satisfactory work ap-

peared to be, to a large extent, a reaction against realism. Juan José Arreola in *Confabulario*, Francisco Tario in *Tapioca* and B. Jiménez Montellano in *El arca del ángel*, to mention a few outstanding examples, were altogether original and, in contrast to the "national" spirit displayed by the essayists, quite "international."

Still, the exceptions to this generalization seemed to be nearly as brilliant: Jorge Ferretis' *El coronel que asesinó un palomo*, for instance, and *El diosero*, Francisco Rojas González' powerful collection of short stories, were all Mexican tales full of human warmth and the salt of the earth. Indeed, the outstanding novel of the year, *El Cristo de espaldas*, by the Colombian diplomat and journalist Eduardo Caballero Calderón, and two prize-winning works, the novel *Coirón* by Daniel Belmar (Atenea award, Chile, 1952) and the short story collection *La docena del fraile o trece cuentos de mi abuela* by the journalist Eudocio Carrera Vergara (Ricardo Palma award, Peru, 1952) belonged to the realistic category. More pronouncedly tendentious, situated on a plane of sharp human struggle, were such powerful novels as *Lluvia y fuego*, a militant exposé of the ruthless tactics of oil companies, by the United States writer Thomas Bledsoe; and *La prisión*, which undertook to expose the existing Peruvian regime and its persecution of the Apra party, of which the author Gustavo Valcárcel was a prominent leader in exile.

The year's poetry output was comparatively feeble, with the notable exception of *Signo*, by the Mexican Honorato Ignacio Magaloni, and *Aventura*, by the Chilean Juan Guzmán Cruchag. Two other mature collections, both from Mexico, were José Gorostiza's *Muerte sin fin*, and Vicente Magdaleno's *Sueños como obsidiana*. The Spanish translation of Brazil's greatest lyricist, Jorge de Lima, was an event of primary importance, the versions by Florindo Villa Álvarez, C. R. Arechavaleta and J. Torres Oliveros proving to be superb. However, the really epoch-making achievement was Alfonso Reyes's version of the *Iliad* (part I), a masterly job by Mexico's prominent literary scholar. Reyes's collected poems were published simultaneously under the title *Obra poética* in a series which also included the posthumous poems of the great Enrique González Martínez. Dynamic signs of poetical vitality were seen in the newly founded poetry magazine *Poesía de América* (editors: Honorato Ignacio Magaloni and Gustavo Valcárcel), published in Mexico City, which included the work of poets from Latin America at large and devoted a section to Spanish poets in exile.

As hinted above, first-rate criticism and essays abounded. In addition to the Mexican series already mentioned, there were some extraordinary critical studies: of the Brazilian Machado de Assis by José Maria Bello; of the Peruvian César Vallejo by Elsa Villanueva Teixeira; and of the Mexicans Manuel José Othón and Ramón López Velarde by Jesús Zavala and Elena Molina Ortega, respectively. Two United States scholars filled important gaps in Latin-American studies: E. Neale-Silva with his perceptive analysis of José Eustasio Rivera's poetry, and Sonja Karsen with her detailed and authoritative dissertation on Guillermo Valencia. Very distinguished studies of *Las Sonatas de Ramón del Valle-Inclán* by Alonso Zamora Vicente, *Estudio del Discurso en loor de la poesía* by Luis Jaime Cisneros (Manuel González Prada award, Peru, 1952), and *Conceptos e imágenes en pensadores de lengua española* by Vera Yamuni Tabush, were imbued with a semantic-philosophical approach. In the field of folklore and ethnography, sundry revealing studies shed light upon many recondite corners of America. In addition to Angel María Garibay's *El folklore de México*, mentioned above, there were *Folklore argentino: Cantares, leyendas y tradiciones de la tierra adentro* by Fermín Alfredo Anzolaz; *Romancero peruano* by Emilia Romero; *Folklore, folkvise y folkway indígena* (Peru) by Julio Baudouin; *Los descendientes del imperio incluído*

Bolivia) by Fernando Iturralde; and the two-volume *Obras* of the young Argentine poet and scholar Eduardo Jorge Bosco, which contained articles on the Gaucho tradition, folkways and literary expression. Paraguay was the subject of a most illuminating treatise by Silvio Maldonado. Covering wider ground were the study of the Argentine novel (*La novela argentina*) by Germán García, of the literature of Spain (*La literatura española*) by the Mexican scholar Julio Torri, and of the Venezuelan short story (*Cuentos y cuentistas*) by the gifted practitioner José Fabbiani Ruiz. Still wider in scope, dealing with the hemisphere at large, were some of the most rewarding books of 1952: *Entre la libertad y el miedo*, simultaneously published in English under the title *The State of Latin America*, by the Colombian diplomat and scholar Germán Arciniegas; *La filosofía como compromiso* by the Mexican philosopher Leopoldo Zea, mentioned above; and *Dependencia e independencia en la historia hispanoamericana* by Mariano Picón-Salas. For brilliance and sheer stylistic virtuosity, none surpassed *Otras inquisiciones* by the Argentine, Jorge Luis Borges. (A. FLO.)

Latter Day Saints: see MORMONS.

Latvia. From Nov. 18, 1918, to Aug. 5, 1940, when it was annexed by the U.S.S.R., Latvia, one of the Baltic states of northeastern Europe, was an independent republic. Area: 25,395 sq.mi. Pop.: (1939 est.) 1,994,500; (1950 est.) 1,100,000. Language: Latvian and Russian. Religion: Lutheran, Roman Catholic and Greek Orthodox. Chief towns (pop., 1935 census): Riga (cap., 1939 est., 393,211); Liepaja (57,098); Daugavpils (45,160). Chairmen of the presidium of the supreme soviet in 1952: August M. Kirchensteins and (from April 11) Karlis M. Ozolins; chairman of the council of ministers, Vilis Lācis.

History.—At the meeting of the supreme soviet of the republic of Riga on April 10–11, 1952, Ozolins was elected chairman of the presidium in place of 80-year-old Kirchensteins, who wished to retire. The new chairman, who was born in 1905, joined the Communist party in 1926, twice receiving sentences for subversive activities; before his election he was editor of *Jaunā gaisma*, the principal organ of the party.

By a decree of the supreme soviet of the U.S.S.R., promulgated on April 8, Latvia's 58 *rayony* or districts were divided among three *oblasti* or provinces with capitals at Riga, Daugavpils and Liepaja. The four historic provinces of Vidzeme, Latgale, Zemgale and Kurzeme ceased to exist.

A report published in January by Janis Kalnberzins, first secretary of the Latvian Communist party, disclosed that the fourth five-year plan, 1946–50, had not been fulfilled with regard to several important industrial products; i.e., brick production reached only 71.6% of the plan and that of meat only 64%. The fifth five-year plan, 1951–55, provided for the enlargement of the port and of the shipyards of Riga as well as for the erection of a thermoelectric power station near the capital. By 1955 the output of electrical energy in the republic was to be double that of 1950.

As a result of the amalgamation of smaller *kolkhozy* into bigger ones, between March 1950 and March 1952 their number was reduced from 4,115 to 1,513, embracing 229,000 or 98.4% of the former farms; 1,092 chairmen of the *kolkhozy* were Communists, but only 915 collective farms had a primary party organization. The *kolkhozy* were served by 105 machine and tractor stations.

By Sept. 1952 the Communist party had 50,000 members; the Union of Communist Youth, according to Elmars Bemanis, its secretary-general, comprised 98,800 members. Kalnberzins averred that inclinations toward the reservation of private prop-

erty in the *kolkhozy* were being encouraged through the anti-soviet activities of "bourgeois nationalists."

Lācis, the premier, who was also a prolific writer of fiction, was criticized in *Cina* in Nov. 1951 for "leftist deviations" discovered in his latest novel, *To Distant Shores*; but on Feb. 25 he was vindicated by the Moscow *Pravda*—not he but his critics exhibited "leftist deviations." G. G. Turs, the soviet-appointed archbishop of the Latvian Lutheran Church, and Mgr. Peter Strods, described by the Communist press as Roman Catholic "deputy metropolitan" of Riga, took part in May in a "defense of peace" conference called at Zagorsk, near Moscow. (See also ESTONIA; LITHUANIA.)

Education.—Schools (1950): elementary 1,598, pupils 232,000; secondary 96, pupils 30,000; technical 66, pupils 20,000; institutions of higher education 10, students 12,500, including Riga university, students 5,500.

Finance.—Budget (1952 est.): revenue 1,453,257,000 roubles; expenditure 1,404,786,000 roubles. (K. SM.)

Law. Fear and uncertainty, engendered chiefly by the Communist drive against the free world, were reflected during 1952 both in federal legislation and in supreme court decisions. The 82nd congress continued the president's emergency war powers, approved a peace treaty with Japan and security treaties with groups of other non-Communist nations, voted appropriations to carry on the Mutual Security program for military, economic and technical assistance to certain friendly nations, enacted a bill of rights granting G.I. benefits to Korean war veterans and approved a new constitution for Puerto Rico. Congress also revised and codified laws relating to immigration, naturalization and nationality, including new provisions designed to tighten the safeguards against subversive elements.

The supreme court lacked a confident majority of justices in cases involving questions of administrative and executive powers. This was apparent in an increasing tendency of the justices toward the literal application of statutes involving public policy, such as laws dealing with aliens and civil rights. There had to be a majority, of course, in reaching a definite decision, but sometimes the majority disagreed sharply as to their reasons for concurring. An extreme instance of this was the steel industry seizure case, the report of which covered 133 pages and presented six individual opinions rendered by the majority of the court and one dissenting opinion in which three justices joined.

Only the more important legal developments of general interest are reported in this article.

Aliens and Citizenship.—The supreme court adhered to a strict construction of statutes authorizing the deportation of aliens resident in the United States. Thus three aliens, who had entered the United States in their youth and stayed for more than 30 years without applying for naturalization, were held to be deportable under the anti-Communist provisions of the Alien Registration act of 1940. Congress had the power to authorize the deportation of legally resident aliens because of membership in the Communist party, even though such membership had terminated before the passage of the act. This provision was not an *ex post facto* law prohibited by the constitution, nor did it violate due process, freedom of speech or freedom of assembly. The courts were not responsible for national policy in respect to the deportation of aliens, which is almost exclusively the province of the political branches of government and "largely immune from judicial inquiry or interference" (*Harisiades v. Shaughnessy*, 342 U.S. 580).

The high court, by a vote of five to four, also approved the action of the attorney general in locking up four aliens, charged with Communist party membership, and holding them without bail pending the determination of their deportability under

the Internal Security act. Such detention was not a violation of the 8th amendment's prohibition against requiring excessive bail (*Carlson v. Landon*, 342 U.S. 524).

In another five-to-four decision the supreme court upheld a death sentence for treason against an American-born citizen of Japanese descent. The fact that he was also a Japanese citizen because of his Japanese parentage was no defense (*Kawakita v. U.S.*, 343 U.S. 717).

A German citizen, however, who had been interned in the United States under the Alien Enemy act and had been ordered removed to Germany by the attorney general, was entitled to release from custody, the supreme court ruled, since the war had been terminated by joint resolution of congress (*Jaegler v. Carusi*, 342 U.S. 347).

While the justices of the supreme court were debating the rights of aliens residing in the United States, the president was struggling with congress over the provisions of a bill revising and codifying all federal laws on immigration, nationality and naturalization. A final draft of the measure, known as the Immigration and Nationality act of 1952, was finally passed over the president's veto. The new law retained the quota system under which the number of immigrants to be admitted to the U.S. annually from any foreign country was limited to $\frac{1}{2}$ of 1% of the number of persons of that national origin already living in the U.S. as shown in the 1920 census. The annual immigration ceiling was set at 154,657, an increase of 308 over the previous limit. Other provisions eliminated race and sex barriers; introduced a system of selective immigration by giving a special preference to skilled aliens urgently needed in the country; provided a more thorough screening of aliens, especially of persons who might be security risks and subversives; broadened the ground for exclusion and deportation of criminal aliens; and let down the bars for the entry of reformed totalitarians, such as former Communists who had turned anti-Communist.

Antitrust.—A trust-breaking action brought by the attorney general against the Oregon State Medical society, eight county medical societies and eight doctors who were officers of a nonprofit corporation called the Oregon Physicians service was unsuccessful in the supreme court. The suit charged that the defendants had conspired to monopolize the business of providing prepaid medical care in Oregon and had prevented doctors generally from working for private health associations. It appeared that in 1936 five private associations were selling prepaid medical certificates entitling the purchaser to hospital and medical care.

At first the doctors' organizations fought this "contract practice" tooth and nail, but five years later the medical profession was convinced that its best protection was to operate a contract practice controlled by its own organizations. The court held that there was no clear proof of a violation of the antitrust laws (*Oregon v. U.S.*, 343 U.S. 326).

Other antitrust decisions followed familiar patterns. The justices all agreed with a lower court decision that exclusive agreements whereby 2,965 automobile service stations had pledged themselves to buy their supplies only from the Richfield Oil corporation violated the Clayton Antitrust act. The court said that this case was substantially the same as the Standard Oil case reported in 337 U.S. 293 (*Richfield Oil Corp. v. U.S.*, 343 U.S. 922). The court also reiterated its former ruling that price control through cross-licensing of patents is a violation of the Sherman Antitrust act. Two formerly competing companies, who had been engaged in litigation over patents, settled their dispute by organizing a holding company and assigning the patents to it. The court held, following the U.S. Gypsum case, that the price fixing through this holding company device was

an illegal restraint of trade (*U.S. v. New Wrinkle*, 342 U.S. 371).

Civil Rights.—The supreme court broadened the free speech and free press guaranties of the 1st and 14th amendments to include freedom of expression by motion pictures, overruling an earlier decision in *Mutual Film Corp. v. Industrial Comm.*, 236 U.S. 230.

A provision of New York's Education law, requiring all motion pictures to be submitted for licensing by a state board, was void as a prior restraint on freedom of speech and of the press because it authorized denial of a licence if the censors found the film to be "obscene, immoral, or sacrilegious." The court therefore revoked the ban of the New York board of regents on the motion picture entitled *The Miracle*, which the board had found to be "sacrilegious because of the scene in which a demented woman is seduced by a stranger whom she thinks is St. Joseph, and of the birth of a child which she considers miraculous." A state cannot prohibit the showing of a motion picture on the basis of a censor's conclusion that it is "sacrilegious" (*Burstyn, Inc. v. Wilson*, 343 U.S. 495).

The high court also dealt with another section of the controversial New York Education law authorizing the public schools of the state to release pupils from school attendance for one hour a week to attend religious classes, provided the religious instruction is held outside of the schools. This "released time" program was distinguished by a majority of six justices from the situation in the McCollum case which the court had found to be a violation of the constitutional guaranty of separation of church and state. In that case the school classrooms were turned over for religious instruction. But the New York system "involved neither religious instruction in the public schools nor the expenditure of public funds and since no one is forced to attend religious centers, there is no conflict with the First Amendment." To the charge that the program was coercive, the majority said "no one is forced to go to the religious classrooms and no religious exercise or instruction is brought to the classrooms of the public schools" (*Zorach v. Clauson*, 343 U.S. 306).

Still another section of the New York Education law, known as the Feinberg law, directing the state board of regents to compile a list of subversive organizations, and making membership in groups so listed grounds for dismissal of a teacher unless his loyalty is proved, was upheld by the supreme court. The eight taxpayers who attacked this statute as a violation of free speech and assembly were told that it was the duty of school officials to screen teachers "as to their fitness to maintain the integrity of the schools. In this process it is proper to examine the associates, past and present, of the person involved. There is nothing unconstitutional in making membership in organizations listed as subversive a ground for dismissal" (*Adler v. Board of Education*, 342 U.S. 485).

In a five-to-four decision the high court upheld the Illinois group libel statute enacted in 1949, which forbids publication of any "lithograph, moving picture, play, drama or sketch . . . which portrays depravity, criminality, unchastity or lack of virtue of a class of citizens of any race, color, creed or religion," or which exposes them to "contempt, derision, or obloquy or is productive of breach of the peace." The court sustained the conviction of the head of the White Circle League of America for violating this law by circulating a petition to white people to join in a campaign against Negroes, referring to the "rapes, robberies, knives, guns and marijuana" of people of the black race. The majority of the justices held that the statute penalizing such antirace libel did not interfere with freedom of speech or the press (*Beauharnais v. Illinois*, 343 U.S. 250).

The supreme court also denied relief to citizens who objected to the broadcasting of radio programs on streetcars and buses in the District of Columbia. It ruled that a passenger on a public vehicle has no right of privacy substantially equal to the privacy which he is entitled to in his own home. Justice William O. Douglas, dissenting, objected to making the streetcar audience a captive one. "When we force people to listen to another's ideas, we give the propagandist a powerful weapon. Once privacy is invaded, privacy is gone. Once a man is forced to submit to one type of radio program, he can be forced to submit to another" (*Public Utilities Comm. v. Pollack*, 343 U.S. 151).

The supreme court also refused to interfere with a New Jersey law requiring daily reading of five verses of the Old Testament in public schools. The court dodged the religious issue by telling the two taxpayers, who attacked the law, that they had suffered no particular injury since there was no showing that Bible reading increased taxes (*Doremus v. Board of Education*, 342 U.S. 429).

Criminal Law.—The decisions of the supreme court in criminal cases were more notable for their novelty than for their legal importance. The forcible use of a stomach pump to get evidence of narcotics law violations from a suspect who was handcuffed and strapped to an operating table profoundly shocked the justices of the supreme court. The suspect swallowed two capsules containing morphine when three deputy sheriffs broke into the room where he and his wife had been sleeping. The officers seized him and rushed him to a hospital where the pills were recovered and later used as evidence in his conviction for the illegal possession of morphine. This was a clear violation of due process, the justices ruled (*Rochin v. California*, 342 U.S. 165).

On the other hand, the court in a five-to-four decision approved the use of a Dick Tracyish device by federal officers to record a conversation with a Chinese laundryman, named On Lee, suspected of narcotics law violation. Chin Poy, an undercover agent, who was an old acquaintance and former employee of On Lee, stopped in at the laundry to have a chat with his former boss. He had a radio transmitter concealed in his inside overcoat pocket with a small antenna running along his arm. Unknown to On Lee, another federal agent was stationed outside the building with a receiving set by which the conversation was recorded. The evidence thus obtained was used at the trial. Five of the justices held that this was not a violation of the constitutional immunity of the accused from unreasonable searches and seizures nor was it a violation of the federal Communications act (*Lee v. U.S.*, 343 U.S. 747).

The complaint of another convict, that while living in Chicago he had been seized by officers from the state of Michigan and handcuffed, blackjacked and taken to Michigan, where he was convicted of murder and sentenced for life, was rejected by the supreme court. The fact that he had been abducted from one state to another did not invalidate his conviction in the latter state under the due process clause. "This court has never departed from the rule announced in *Ker v. Illinois*, 119 U.S. 436, 444, that the power of a court to try a person for a crime is not impaired by the fact that he had been brought within the court's jurisdiction by reason of a 'forcible abduction'" (*Frisbie v. Collins*, 342 U.S. 519).

The supreme court justices showed a growing skepticism concerning the complaints of convicts that they had been coerced into confessing their guilt. The justices took the view that if a confession was procured by coercion, either physical or psychological, the conviction should be reversed, but the record must show a real denial of due process. Thus a California petitioner was told that he had not demonstrated any unfairness by

ATTORNEY GENERAL James P. McGranery (foreground) with some of the 91 U.S. district attorneys who convened in Washington, D.C., for their annual meeting in 1952. McGranery was sworn into office on May 27

the court in his trial for killing a six-year-old girl (*Stroble v. California*, 343 U.S. 181).

The court also declined to interfere on behalf of a defendant convicted and sentenced to death for the "sex-killing" of a 15-year-old girl in Oregon. The state statute requiring a defendant to sustain his plea of insanity beyond a reasonable doubt was not a violation of due process. There is no significant difference "between the Oregon rule requiring the accused, on a plea of insanity, to establish that defense beyond a reasonable doubt, and the rule in effect in about 20 states, which places the burden on the accused to establish his insanity by a preponderance of the evidence" (*Leland v. Oregon*, 343 U.S. 790).

The summary contempt sentence imposed by the trial judge against the attorneys for 11 Communist party leaders for violating the Smith act was sustained by the supreme court in a

five-to-three vote. The judge did not lose his power to punish for contempt under federal rule 42(a) by postponing the contempt hearing till the end of the trial. In a long dissenting opinion, which quoted copiously from the record of the trial, a minority of the justices thought the contempt sentence was unfair. Justice Felix Frankfurter made the point that the trial judge should have invited the senior circuit court judge to assign another judge to hear the charges (*Sacher v. U.S.*, 343 U.S. 1).

The high court also served notice on all spies and potential spies that it would leave them to the mercies of a trial court and jury. The repeated pleas of a husband and wife, convicted of giving secrets regarding the atomic bomb to the U.S.S.R., for a review or rehearing of their case, were rejected by the supreme court. Thus the first death sentence for peacetime spying was in effect affirmed by the high court.

Economic Controls.—The Defense Production Act Amendments of 1952 extended wage and price controls through April 30, 1953, but contained a policy statement directing the president to decontrol prices as fast as was consistent with the purposes of the act. Authority to regulate retail credit, allocations and priorities and real estate credit was extended to June 30, 1953. Rent control was extended to Sept. 30, 1952, with the proviso that areas which were certified as critical defense housing areas might continue the control until April 30, 1953. Local authorities might also request the extension of rent control to April 30, 1953. Congress also extended the agricultural conservation program to Dec. 31, 1954.

Fair Trade Laws.—Congress in effect overruled the supreme court's 1951 decision in the *Schwegmann* case by enacting a new Fair Trade law, making clear the type of law which congress had intended to authorize when it passed the Miller-Tydings act. The new Fair Trade law provided that a manufacturer and one retailer may set minimum prices on brand-named items and thereby bind all retailers in any state, including those who do not sign such an agreement.

Labour.—A threatened strike by the United Steelworkers of America precipitated a legal battle over the president's seizure powers. After many efforts of government agencies had failed to bring about a settlement, Pres. Harry S. Truman ordered the secretary of commerce to seize and operate the nation's steel

mills to avert a work stoppage which would endanger the national defense program. The steel companies, however, applied to the district court for an injunction against the seizure, which they obtained. The supreme court by a vote of six to three held that the lower court was correct because seizure of the mills was not authorized by the statutes or laws of the United States. There was no specific statute giving him power to seize property, nor could such power be implied from those specified in article ii of the constitution, nor could it be justified as an exercise of the president's military power as commander in chief of the armed forces (*Youngstown Co. v. Sawyer*, 343 U.S. 579).

A judgment in favour of a lumber company against the International Longshoremen's and Warehousemen's union in the amount of \$750,000 for damages for illegal picketing was affirmed by the supreme court. The union contended that the Taft-Hartley law provision under which suit was brought rendered illegal only such picketing as takes place after a determination by the National Labor Relations board that the acts complained of are unfair labour practices. Said Justice Douglas, speaking for the court, "Petitioners, representing one union and employing outside labor, were trying to get the work which another union, employing mill labor, had. That competition for work at the expense of employers has been condemned by the labor-management act. It represents national policy which has both administrative and conventional legal sanctions" (*Longshoremen v. Juneau Spruce Corp.*, 342 U.S. 237). The conviction of an employer for violating a Missouri law which provided that any employee entitled to vote may absent himself from his work for four hours between the opening and the closing of the polls on election day was sustained by the supreme court. Such laws do not violate the due process or equal protection of the law clause of the 14th amendment. Nor do they impair the obligation of contracts in violation of article i, section 10 of the federal constitution (*Day-Brite Lighting, Inc., v. Missouri*, 342 U.S. 421).

The attempt of a railway union, composed exclusively of white employees, to destroy the jobs of Negro "train porters" was rebuked by the supreme court. The union, acting under the Railway Labor act as bargaining representatives for railroad trainmen, had no right to force the railroad company to maintain bars against the employment of Negro workers. A bargaining agent "cannot use its position and power to destroy colored workers' jobs in order to bestow them on white workers" (*Railroad trainmen v. Howard*, 343 U.S. 768).

An attack on Michigan's antistrike law, applicable to certain public employees, failed in the Michigan supreme court. The court ruled that this law applied to employees of the municipal street railway system. It was not a breach of due process, nor a bill of attainder, nor did it impair the obligation of contract (*Detroit v. Division 26*, 51 N.W. 2d 228).

Congress provided for safer working conditions in coal mines whose operations affect interstate commerce. Mine operating concerns which employed more than 14 persons underground were required to meet certain standard safety provisions stated in the statute. The new act also created a federal coal mine safety board of review to hear appeals from the orders of federal coal mine inspectors.

Social Security.—Congress amended the Social Security act by increasing old-age and survivors' insurance payments by \$5 a month or 12½%, whichever was greater. Beneficiaries under the act would be permitted to earn \$75 a month in covered employment, instead of the previous \$50, without losing their status as pensioners. The new law also granted a credit of \$150 a month for each month of active military or naval service after July 24, 1947, and before Jan. 1, 1954. Other amendments

"SOME THINGS DON'T NEED TO BE SEEN," a cartoon by Berryman of the *Washington Star*

"ANOTHER HOT RIVET," a 1952 cartoon by Long of the *Minneapolis Tribune*

increased the federal share of the public-assistance payments to states for aid to the aged, blind and disabled.

Taxation.—Three decisions of the supreme court in tax cases dealt with problems of unusual interest. A composer of music, who had won a prize award of \$25,000 for a symphony submitted by him in a contest, included the entire amount in his income tax return as part of his gross income for 1947. He later filed a claim for refund on the ground that the award was a non-taxable gift, but his claim was rejected by the internal revenue office. He then applied for permission to amend his returns and to spread the award over the three-year period when he was working on the composition. The supreme court ruled that the award was not a gift, but that the composer should report the award as distributed over a 36-month period ending with the close of the year in which the award was paid and not some earlier period of 36 months during which the composition was being written (*Robertson v. U.S.*, 343 U.S. 711).

In another unusual case the supreme court held that money obtained by extortion was income returnable and taxable to the extortioner. A taxpayer had "muscle in" on a bootlegging operation known as the "High Seas Venture" from which he extracted about \$25,000 in cash, but he failed to list this money as income in his tax return. His conviction for wilfully evading his taxes was affirmed (*Rutkin v. U.S.*, 343 U.S. 130).

The court also upheld the right of optical companies to deduct as ordinary and necessary expenses "kickbacks" paid to physicians referring customers to the optical company. During the years in question—1943 and 1944—there was no governmentally declared public policy, national or state, proscribing such payments (*Lilly v. C. I. R.*, 343 U.S. 90).

The high court also settled a dispute between the state of Tennessee and contractors and retailers dealing with the Atomic Energy commission. The Tennessee revenue laws imposed a sales tax on the sale of goods within the state and a use tax on the use within the state of goods purchased outside the state. The court held that contractors dealing with the Atomic Energy commission and merchants who sold goods to those contractors

were exempt from such taxes under the provisions of the Atomic Energy act (*Carson v. Roane-Anderson Co.*, 342 U.S. 232). (See also *INDIANS, AMERICAN*; *MUTUAL SECURITY PROGRAM*; *NATIONAL LABOR RELATIONS BOARD*; *UNITED STATES.*) (M. DN).

United Kingdom Legislation.—Of the legislation undertaken by the parliament of the United Kingdom in 1952, the Defamation act was almost certainly the most significant measure. It made a number of important changes in the law of libel and slander, summarized as follows: (1) defamation in a broadcast was to be treated as libel, not slander, the most important consequence of which was that it would be actionable without proof of special damage; (2) slander calculated to disparage a plaintiff in any office, profession, calling, trade or business held or carried on by him at the time of the publication was to be actionable without proof of special damage; (3) slander of title and certain other forms of malicious falsehood were made actionable without proof of special damage in certain circumstances; (4) unintentional defamation was not to be actionable where a proper offer of amends was made; thus parliament in effect overruled the decision of the house of lords in the leading case of *Hulton v. Jones* and the intention of the publisher, not the effect of the publication on the plaintiff, was made the crucial test; (5) a defense of justification would not fail by reason only that the truth of every charge was not proved if the words not proved to be true did not materially injure the plaintiff's reputation having regard to the truth of the remaining charges; (6) important extensions were made to the principle that newspapers have a qualified privilege in reporting certain matters of public interest; (7) agreements for indemnity against liability for civil libel were made lawful in certain circumstances; (8) evidence might be given in mitigation of damages where the plaintiff had been awarded or had claimed damages for the publication of words to the same effect as those in respect of which he made his claim.

Other measures affecting the administration of the law included the Judicial Officers (Salaries) act, raising the salaries of and making further provision for pensions for county court judges and metropolitan magistrates, and the Magistrates Courts act, an important consolidation measure. Of some interest to the general public were the Disposal of Uncollected Goods act (permitting the sale of goods accepted for repair but not collected) and the Hypnotism act, regulating the practice of hypnotism for public entertainment.

United Kingdom Case Law.—Although there were no great judicial issues in 1952 there were a number of decisions of general interest. One was *The National Trust v. The Midlands Electricity Board* (1952 1 *Times Law Reports* 74), in which covenants made with the National Trust not to injure the natural aspect and condition of land were held void for uncertainty.

More important was *R. v. Tronoh Mines, Ltd.* (1952 1 *Times Law Reports* 461). The question here was whether the effect of the Representation of the People act, 1949, was to prohibit during the period of a general election expenditure whose real purpose was general political propaganda as distinct from propaganda directed at securing the return of a particular candidate in a particular constituency. The facts were that the defendant company had bought advertising space in a national newspaper and had used it to attack the policies of the Labour government in office before the election, and the prosecution's case was that such expenditure would tend to secure the return of candidates in each constituency opposed to the Labour government and that it would not be included in any of the statutory returns of such expenditure. The court, however, held that propaganda of a general character not designed to secure the return of a particular candidate in a particular constituency was not affected

by the act.

An issue of considerable importance to trade unions was decided in their favour by the court of appeal in *D. C. Thomson and Co. v. Deakin* (1952 2 *Times Law Reports* 105) when it was held that incitement to withdrawal of labour by employees with the natural and probable consequence that the employer might be compelled to break his contract with a third party did not constitute the tort of procuring a breach of contract. The plaintiffs here were a firm that refused to employ union labour and this matter aroused nation-wide interest.

There were a number of judicial decisions of interest from the standpoint of matrimonial relations. In *Bayliss v. Blackwell* (1952 1 *All England Reports* 74) it was held that the common law unity of husband and wife had not been so affected by legislation as to give a husband the right to sue the wife for civil wrongs (here motorcar injuries) inflicted by her before marriage. In *Bennett v. Bennett* (1952 1 *All England Reports* 413) the court of appeal held that an agreement by a wife not to apply to the court for maintenance was contrary to public policy and therefore void as ousting the jurisdiction of the courts. In *Best v. Samuel Fox and Co.* (1952 2 *Times Law Reports* 246), where the plaintiff's husband had been injured by the defendants' negligence, it was held that the husband's consequent loss of sexual capacity did not render them liable to the wife in damages.

Commonwealth Legislation.—South Africa.—During 1952, in the broad field of constitutional development as distinct from private law, all else was overshadowed by the controversies inside the Union of South Africa aroused by and emanating from the Nationalist party's policy of *apartheid*, or the segregation of the black from the white citizens of the union, which policy the government under the premiership of D. F. Malan (*q.v.*) was putting into effect. The High Court of Parliament act, which threw into the melting pot the whole relationship between the legislature, the executive and the judiciary of the union, was the principal question involved, but by no means the only one. There were, in addition, the Suppression of Communism (Amendment) act and the Natives (Abolition of Passes and Coordination of Documents) act.

The great issue, the High Court of Parliament act and its consequences, arose from the Separate Representation of Voters act, itself a notable emanation of the policy of *apartheid*. The legality and constitutionality of the Separate Representation of Voters act was challenged in the courts, and ultimately the appellate division of the supreme court set the act aside as being outside the authority of the government without an amendment to the South Africa act, which would require a two-thirds majority in the senate and house of assembly sitting together. The appellate division thus reversed, or at any rate refused to follow, its own previous decision of a similar issue in 1937.

On March 20, 1952, the prime minister made a statement in the house of assembly on the appeal court's decision in which he said: "The judgment of the Appeal Court in the matter of the separate representation of voters, which reverses its previous judgment of 1937, has created a constitutional position which cannot be accepted. Neither Parliament nor the people of South Africa will be prepared to acquiesce in a position where the legislative sovereignty of the lawfully and democratically elected representatives of the people is denied, and where an appointed judicial authority assumes the testing right . . . particularly since that judicial authority does not, or is not obliged to, act consistently."

In both the house of assembly and the senate the opposition soon showed its intention to resist the evident purpose of the government to overrule the court of appeal. On April 23 the High Court of Parliament bill was introduced into the house of

assembly. As amended in committee of the whole house the essence was to provide that any judgment or order of the appellate division of the supreme court of South Africa—whether given before or after the bill became law—whereby the appellate division declared or rendered invalid any provision of any act of parliament or in any manner rendered such a provision inoperative should be subject to review by the high court of parliament. This court was to be composed of every senator and every member of the house of assembly, with one of its members appointed by the governor general to be its president, 50 members forming a quorum. Applications for review of any judgment or order were to be made by a minister within six months of the appellate division's ruling (or, in the case of rulings made before the act came into force, within six months of the passing of the act). The president of the court was within 30 days of the making of such an application to refer it to a committee of the court to be known as the judicial committee, which was to be composed of ten members of the court appointed by the president. The judicial committee was to be empowered to consider written or verbal representations concerning the application; and after it had considered the appellate division's record of proceedings, the reasons given by the judges and the representations made by the parties, it was to report to the high court, making such recommendations as it thought fit. The high court of parliament was empowered to make such order as it thought proper after considering the report and recommendations of the judicial committee; the court's decision was to be final and binding and to be executed as if it were a decision of the provincial division of the supreme court in which the matter was originally heard.

The opposition contested the bill by every means within its power. J. G. N. Strauss raised the question, in the debate on the second reading, whether the bill did not have to be passed by a joint sitting of both houses in that it embodied provisions amending section 152 of the South Africa act and whether the motion that the bill be read a second time should not be disallowed. He argued that the bill was merely an attempt to get parliament as ordinarily constituted to nullify the appeal court's decision in *Harris v. Minister of the Interior* (setting aside the Separate Representation of Voters act) and to circumvent the guarantees given to individuals under sections 35 and 152 of the South Africa act. This submission was overruled.

The minister of the interior, introducing the bill, argued that its object was to restore to the democratically elected representatives of the people the right to decide on the validity of acts of parliament, and that it was a natural development from the high court of parliament in the United Kingdom. For the opposition, Strauss, in the course of the debate, stressed that the appeal court judgment of 1937 arose from an act of parliament passed by both houses sitting together with a two-thirds majority. During May the bill passed through both houses. When enacted, the next stage of the battle, as with the Separate Representation of Voters act, was carried to the courts. The high court overruled the High Court of Parliament act; the matter was taken to appeal, on Nov. 13, 1952, and the appellate division of the supreme court unanimously declared the High Court of Parliament act invalid.

Canada.—In the dominion parliament one of the most interesting measures, in view of the controversies aroused by the practice of resale price maintenance in the United Kingdom, was the Combines Investigation Amendment act, prohibiting those engaged in manufacturing, supplying or selling commodities from fixing specific or minimum resale prices. The Visiting Forces (North Atlantic Treaty) act was a measure passed similar to measures in the United Kingdom and other parliaments to give effect to the agreement between the North Atlantic treaty

owers of June 19, 1951, on the legal status of visiting forces, subjecting them to their own rather than local law. The Old Age Security act provided for pensions, without means tests, for all persons at the age of 70.

In the Canadian provinces, both Ontario and Saskatchewan introduced legislation broadly on the lines of the Crown Proceedings act, making it possible to sue the crown in tort and in contract.

Australia.—The Conciliation and Arbitration bill was the principal measure of general interest submitted to the Commonwealth parliament, its object being to broaden the jurisdiction of the court composed of three arbitration court judges dealing with industrial disputes.

In Tasmania a somewhat drastic but rather interesting Sexual Offences act was passed, the most striking feature of which was that it made it possible for an incurable offender to be segregated for the rest of his life. In New South Wales a Workers' Compensation (Amendment) act was passed, adding new classifications of persons and of injuries, and increasing the maximum compensation from £1,000 to £2,000. Queensland enacted a Law Reform (Abolition of the Rule of Common Employment) act, following the United Kingdom measure of 1948 and similar measures in other Australian states, while the legislatures of South Australia and Western Australia grappled with the thorny problem of rent restriction.

New Zealand.—The most interesting statute passed in 1952 appeared to be the Police Offences Amendment act, a controversial measure intended to strengthen the law against sedition and intimidation in order, particularly, to remedy weaknesses disclosed during the strike of waterside workers. It contained a very wide definition of "seditious intention" much criticized by the opposition.

India.—A noteworthy measure in 1952 was the Press (Objectionable Matter) act, providing against "the printing and publication of incitements to crime and other objectionable matter." By empowering the government to declare certain publications forfeited and to seize and destroy unauthorized newsheets and newspapers and presses producing them, it appeared at first to be a severe and repressive enactment. In fact, it limited the powers to these ends conferred on the executive under the Emergency Powers act.

Lawn Bowling. The annual national tournament of the American Lawn Bowling association was held at Seattle, Wash., July 28–August 2, 1952. The types of play and results were as follows.

Triples.—First place, and winners of the Rettie Memorial trophy: Wallace Kenmuir (skip), John Lang and Percy Smith of the Vancouver South club, Vancouver, B.C. Second place (Chicago cup): Alec Houston (skip), J. Morrison and A. Morrison of the Mt. Pleasant club, Vancouver, B.C. Third place (Wisconsin trophy): Frank P. Webb (skip), James Langlow and Ted Sherwood of the Queen City club, Seattle, Wash.

Doubles.—First place (California trophy) was won by Richard Folkins and Hugh Folkins of the Arroyo Seco club, Los Angeles, Calif. Second place (Lakeside trophy) was won by George Jewar and Jack Scrivener of the Terminal club, Vancouver, B.C. Third place (Western New York trophy) was won by Ernest Griffiths and Charles P. Middleton of the Queen City club, Seattle, Wash.

Singles.—First place (National Singles trophy) was won by Hugh Folkins of the Arroyo Seco club, Los Angeles, Calif.; while second place (Metropolitan trophy) was won by W. G.

"Bill" Hay of the Beverly Hills club, Beverly Hills, Calif.

Milwaukee, Wis., was chosen for the 1953 national tournament, commencing July 11. (L. PR.)

Lawn Tennis: see TENNIS.

Lead. The outputs of the major producing countries listed in Table I, as reported by the U.S. bureau of mines, ordinarily account for about 90% of the world total.

Although mine production in the first half of 1952 was somewhat above the 1951 average, it declined later, and the total for the first eight months was 261,710 tons.

Canada.—Lead production was 80,459 tons in the first half of 1952, up from 75,918 tons in the same period of 1951. (See also MINERAL AND METAL PRODUCTION AND PRICES.)

(G. A. RO.)

League of Women Voters of the United States: see SOCIETIES AND ASSOCIATIONS, U.S.

Leather. Leather production in the United States remained on a moderate level through 1952, following the pattern of the preceding year. However, by midyear, U.S. tanners had an intensive merchandising program under way which, in a few months, showed encouraging results in regaining important markets lost to substitutes since the beginning of World War II and in securing increased fashion acceptance of leather.

Economic and merchandising factors were of primary concern to U.S. tanners in 1952. Raw stock and tanning materials were in good supply, both from foreign and domestic sources. No major scientific or technical advances were reported through the year.

In general, conditions in the U.S. industry corresponded with those in other major leather-producing countries of the world, in so far as conditions could be determined from incomplete reports.

Domestic raw stock assumed increased importance to the U.S. industry, with supplies steadily increasing above previously normal levels. The number of cattle on feed in the United States on Jan. 1, 1952, was 11% larger than a year before. The number of sheep and lambs on feed also moved up sharply, and on Jan. 1, 1952, was 15% higher than a year earlier. World sheep

Average U.S. Monthly Leather Production
(000's omitted)

	1952	1951	1950	1949	1948
All cattle hides (including kips for side leather)	1,821	1,890	2,032	1,994	2,173
Calf and whole kip	787	665	888	847	873
Goat and kid	2,446	2,583	3,100	2,898	3,164
All sheep and lamb	2,255	2,044	2,617	2,387	2,794

1952 figures are based on an average of the first nine months' production. Compiled from data of the Tanners Council of America and the U.S. Bureau of the Census.

numbers, reported by the U.S. department of agriculture, stood at a total of 803,300,000 head on Jan. 1, 1952. This compares with a 1941-45 average of 758,700,000 head.

Suspension by the Office of Price Stabilization of price controls for cattle hides, kips and calfskins was announced in April. A month later the OPS removed price ceilings on all types of leather and leather-making raw materials, foreign and domestic, with the exception of scrap leather.

The Tanners Council of America predicted a continued heavy flow of cattle to market in early 1953, and also predicted that in spite of increased slaughter the U.S. cattle population in 1953 would reach the all-time high level of 93,000,000 to 94,000,000 head.

The U.S. leather industry continued through 1952 to lose segments of its major market, the shoe manufacturing industry, to substitute materials. It was estimated that 60% of the shoes made in the U.S. in 1952 were made with soles of leather-substitute materials—an all-time high record and a market loss that had been steadily slowing heavy leather manufacturing operations since 1944.

Confronted with economic and merchandising problems of the year, the Tanners Council Laboratory committee in 1952 adopted a major program of continuous effort aimed at product improvement as an essential phase of trade promotion and public relations.

Through the year, U.S. tanners also carried out active steps to combat misrepresentation and deception by imitations of leather through false and misleading advertising and deceptive trade names. A large number of these cases were placed before the Federal Trade commission, and in other cases court action was being prepared.

Perhaps the most noteworthy aspect of U.S. tanning operations in 1952 was an increased and widespread recognition by the industry of "the potential scope and character of the changes that can and have taken place in consuming markets." There were some, in fact, who believed the entire industry was undergoing a period of change which would, in coming years, culminate in basic changes in the character of leather-making operations, products and markets. (See also SHOE INDUSTRY.)

(R. B. B.)

Lebanon. Lebanon is an Arab republic, bounded west by the Mediterranean sea, north and east by Syria and south and southeast by Israel. Area: 3,470 sq.mi. Pop. (1951 est.): 1,285,000. Language: Arabic (90%); Armenian, Greek, etc., also spoken. Religion: Christian 52.8%; Moslem 45.3%. Chief towns (pop. 1949 est.): Beirut (cap., 201,451); Tripoli (65,137); Zahle (24,776). Presidents of the republic in 1952: Sheik Bishara al-Khuri and (from Sept. 23) Camille Shamun (q.v.). Prime ministers: Abdullah el-Yafi, Sami Solh (from Feb. 11), Nazim Akkari (from Sept. 9), Saab Salaam (from Sept. 12) and (from Sept. 18) Gen. Fuad Shenab.

History.—On Jan. 9, 1952, the last of the currency restrictions imposed in 1944 were removed; later in the month the Lebanese government submitted to parliament a proposal to establish a central economic council to study the country's resources and to supervise development projects. This was followed in February by an announcement that the following projects would be included in the program to be carried out with

Point Four aid: the Litani river irrigation scheme; the enlargement of the Beirut port and its free zone; and the improvement of the Tripoli port.

Other allocations would be devoted to the development hospital, housing, social insurance and radio services.

In March the customs union with Syria was restored; it had been abrogated in 1950 (see Syria). In June the government signed a new agreement with the Iraq Petroleum company. Under this agreement the right-of-way dues for the passage of I.P.C. pipe lines through Lebanese territory were increased and the company undertook to expand its Tripoli refinery to satisfy Lebanese requirements. In July the existing trade agreements with Germany were revised and a trade agreement was signed with Czechoslovakia.

In August the opposition parties demanded the resignation of the president, Bishara al-Khuri. It was countered by the government's convening an extraordinary meeting of parliament to secure special powers to carry out a series of "urgent" political, economic and social reforms. No decision was reached; on Sept. 9 the president accepted the cabinet's resignation and appointed in its place a three-man emergency cabinet under Nazim Akkari. It was succeeded on Sept. 12 by a new ministry under Saab Salaam, which at once published decrees forbidding demonstrations. On Sept. 18, after a peaceful three-day strike in Beirut and under pressure from the army, President Khuri resigned and an interim ministry under Gen. Fuad Shenab took office. On Sept. 23 Camille Shamun, a prominent member of the Socialist opposition, was elected president by parliament and on Sept. 29 he consulted with Col. Adib es-Shishakli, Syrian chief of general staff and head of the ruling Higher Military council, about closer co-operation between Lebanon and Syria. (See also MIDDLE EAST.)

(O. M. T.)

Education.—Schools (1949): primary 734, pupils 60,019; private 456, pupils 75,475; foreign 279, pupils 53,028; technical and trade 5, pupils 456. Universities 2, students 2,147.

Agriculture.—Main crops (metric tons, 1949): wheat 50,000; barley 27,000; maize 13,000; oats 2,000; potatoes 40,000. Fruit products (metric tons, 1951): grapes (1949) 90,000; olives 40,000; olive oil 13,000; oranges and tangerines 62,000; lemons 15,000. Livestock (1951 est.): goats 400,000; sheep 25,000; cattle 20,000; horses 10,000; donkeys 20,000; mules 5,000. Wool production (incl. Syria; greasy basis, 1951) 6,000 metric tons.

Industry.—Production (metric tons, 1949): cotton yarn 6,800; cotton textiles 6,000; silk and rayon textiles 2,600; leather, hides and skins 2,700; cement (1951) 302,400.

Finance and Banking.—Budget: (1950 est.) balanced at L.L. 85,300,000 (1951 est.) balanced at L.L. 85,300,000. Currency circulation (June 1951) L.L. 199,000,000. Bank and government deposits (May 1952) L.L. 20,000,000. Monetary unit: Lebanese pound, with an exchange rate (Nov. 1952) of L.L. 6.16 to the pound sterling and L.L. 2.21 to the U.S. dollar.

Foreign Trade.—(1951) Imports L.L. 298,500,000; exports L.L. 89,700,000. Main sources of imports (1951): Syria 20%; U.S. 16%; France 12%; U.K. 10%. Main destinations of exports: Syria 25%; U.S. 25%; Egypt 11%; Italy 5%.

Transport and Communications.—Roads (1949): 1,540 mi. Licenced motor vehicles (Dec. 1950): cars 10,723, commercial vehicles 3,600. Railways (1949): 475 mi. Telephones (1951): 4,245. Radio receiving sets (1949): 31,000.

Leeward Islands. This British colony is composed of four presidencies, a group of islands forming the northern part of the Lesser Antilles in the Caribbean. Population, mainly Negro. Religion: Christian. Principal towns: St. John's, Antigua (cap., c. 12,000), Basseterre, St. Christopher (c. 13,000). Governor in 1952, Sir Kenneth Blaxter.

History.—The general legislative council and the legislative councils of St. Kitts-Nevis-Anguilla and Montserrat were established under the new constitution. There was also introduced

	Area (sq.mi.)	Population (1946 Census)	(1951)
Antigua (with Barbuda)	171	41,757	46,000
St. Kitts-Nevis-Anguilla	152	46,243	50,000
Montserrat	32	14,333	13,000
Virgin Islands	67	6,505	7,000
	422	108,838	117,000

a new system of committees of the councils, which dealt with groups of related departmental subjects; the object was to associate unofficial members of the councils with the government's policies and to familiarize them with the problems of day-to-day administration.

In Antigua, in contrast with the preceding year, industrial peace prevailed. The Antigua development plan was revised and a loan program prepared, laying particular stress on economic development. A record sugar crop (34,254 tons) was produced and the cotton crop exceeded 500,000 lb. With a generous development and welfare grant, the improvement of the inadequate water supplies was begun. Great progress was made with the hurricane re-housing program, about 600 "self-help" houses being built, in addition to those being put up by two "aided-self-help" housing groups. St. Kitts produced a record sugar crop (50,613 tons). The new electricity scheme for St. Kitts was brought into operation, and a start was made with slum clearance in Basseterre. The cotton crop in Montserrat was about 400,000 lb.; a scheme for pasture development and livestock improvement was approved. In the Virgin Islands plans for livestock development were implemented by the importation of pedigree livestock, the provision of agricultural credit for pasture improvement and the development of water supplies. In addition a thorough geological survey was undertaken with special reference to water supply and mineral potential.

Education.—The numbers of pupils enrolled in the public schools, and the government expenditures, were as follows:

	Pupils (1951)		Government expenditure
	Primary	Secondary	
Antigua	9,756	1,022	B.W.I. \$217,470
St. Kitts-Nevis-Anguilla	10,700	656	B.W.I. \$261,120
Montserrat	3,224	163	B.W.I. \$110,838
Virgin Islands	1,668	82	B.W.I. \$ 62,458

Finance and Trade.—Monetary unit: British West Indian dollar, valued at 58.33 cents U.S. (B.W.I. \$4.80=£1 sterling).

	Budget (1952 est.)	
	Revenue*	Expenditure*
Antigua	B.W.I. \$2,824,073	B.W.I. \$3,114,668
St. Kitts-Nevis	B.W.I. \$2,948,214	B.W.I. \$2,538,789
Montserrat	B.W.I. \$ 587,549	B.W.I. \$ 643,229
Virgin Islands	B.W.I. \$ 183,948	B.W.I. \$ 247,729
Federation†	B.W.I. \$ 87,554	B.W.I. \$ 87,554

*Excluding grants-in-aid from the United Kingdom Treasury and Colonial Development and Welfare funds. †Federal budget other than contributions from presidencies.

Principal exports: sugar, cotton (sea island). Production: sugar (1952) 84,867 tons; cotton exports (1951) 15,202 cwt. (P. H-Mv.)

Liberia. Liberia, on the great western bulge of Africa, immediately north of the equator and adjacent to the great rain forests, is the only republic in Africa. It has an area of 43,000 sq.mi. and a population (est. 1950) of about 1,350,000. Monrovia, the seaport capital (est. 1950 pop., 12,000) is the republic's only town with a population greater than 4,000.

The religion is preponderantly native tribal, with a total of 23 native tribes and clans represented. In addition, 18 Christian denominations were active in missionary work.

President in 1952: William V. S. Tubman.

History.—In Jan. 1952 William Tubman was inaugurated at Monrovia for his second term as president of Liberia. In his address Tubman noted that Liberia had no domestic or foreign debts. He proposed a three-year compulsory military training program for men between the ages of 16 and 45. William R. Tolbert succeeded Clarence Simpson as vice-president and

RECEPTION for Liberian chiefs at Monrovia following the inauguration of Pres. William V. S. Tubman (left) who entered his second term of office in Jan. 1952

Foreign trade, 1951	
Imports	Exports
B.W.I. \$5,117,483	B.W.I. \$2,882,375
B.W.I. \$7,150,229	B.W.I. \$6,486,692
B.W.I. \$ 890,474	B.W.I. \$ 631,296
B.W.I. \$ 294,949	B.W.I. \$ 297,829
—	—

Simpson was appointed ambassador to the United States.

President Tubman asked the U.S. for a revision of the Bomi hills mining contract which would give Liberia one-half of the profits and representation

on the board of directors. Republic Steel of the U.S. was the majority stockholder and chief importer of the mines which in 1952 were producing iron ore at an annual rate of 1,000,000 tons. Under the terms of the agreement reached in October, Liberia, upon liquidation of its debt of \$4,000,000 or on April 1, 1957, whichever date was earlier, would begin to share net profits. Until then, royalties of \$1.50 a ton, in addition to royalties provided in the concession, U.S. currency, would be paid.

On Sept. 2 the first part of a \$1,000,000 shipment of materials and machinery for the new community of Tournata was unloaded. The Liberian government set aside 500,000 ac. for this development, which was sponsored by Robert G. LeTourneau of the U.S. (X.)

Education.—In 1951 Liberia had 89 government schools, 71 mission schools and 29 tribal schools, with the latter showing the greatest increase. Institutions for advanced education included the College of West Africa and Liberia college, both of Monrovia, and the Booker T. Washington institute, at Kakata, for the agricultural and basic industrial training of sons of native chiefs and other tribespeople.

Finance.—The U.S. dollar is the official monetary unit and is supplemented by Liberian fractional coins with the dollar base freely negotiable and at par. Actual revenue in 1951 was \$12,830,685; expenditure, \$10,444,828. Revenue for 1952 was estimated at \$8,500,000; expenditure \$11,000,000, including expenditures from proceeds of loans from the U.S. Export-Import bank.

Trade.—Exports in 1951 totalled \$52,549,457; imports were \$18,135,897. Chief exports were rubber (88%), palm kernels (7%) and iron ore (2%). Leading customers were the U.S. (92%), the Netherlands (5%) and Germany (2%); leading suppliers, the U.S. (67%), the United Kingdom (10%) and Germany (3%).

Industry and Agriculture.—Subsistence agriculture is the preponderant source of employment, with rice the principal subsistence crop. Firestone Plantations company remained the largest commercial enterprise in 1952. About 80,000 ac. were planted with rubber trees. Agricultural exports in 1951 included rubber 39,989 short tons; palm kernels 23,428 tons; palm oil 4,128 tons; piassava 1,362 tons; cacao 315 tons. Mineral exports included iron ore 166,396 tons and gold 2,999 oz.

(J. W. Mw.)

Libraries. The 1952 annual conference of the American Library association in New York city drew more than 5,000 librarians to consider the problems of censorship and the free flow of ideas within the United States and among nations. Mrs. Eleanor Roosevelt spoke on winning the battle of democracy with weapons of education and knowledge rather than through techniques of suppression and ignorance. Other principal speakers were Norman Cousins, Gilbert Highet, Robert Blakely, John Bakeless, Lawrence Powell, Judah Goldin, Alan Barth and Robert Lang.

Two preconference institutes at Columbia university concerned themselves with strengthening education services in public libraries and with the subject analysis of library materials. The first conference reflected the increasing role of adult educational activities in the public libraries; the second reflected the struggle librarians were having with bibliotechnology.

An attempt was made at the annual conference to bring all the national library associations together into one federation, but this apparently could not be done until more study had been given to the condition of confederation.

The Ford foundation announced that it would renew its grant of \$200,000 for the "Heritage in Time of Crisis" adult discussion program, the money to be spent in the experimental centres that had evolved successful programs during the first year. Preliminary evaluation of the year's experimentation had suggested that adults were eager to discuss important civic problems with enlightened but not professorial leadership. Public librarians are able to provide that kind of leadership.

The U.S. state department provided funds with which the American Library association distributed copies of Henry Steele Commager's *Living Ideas in America* to 700 libraries in other countries.

Pressure on libraries to censor books that irritated special community interests increased steadily, and librarians began to reconsider their defenses, with uneasy recollections of similar events in the early years of the totalitarian states, in Europe and elsewhere. The Ford foundation gave the American Library Association Intellectual Freedom committee \$15,000 with which to sponsor a two-day conference on the problem of censorship in libraries.

On the international scene, librarians from the United States participated in the tenth birthday celebration of the Bibliotheca Benjamin Franklin in Mexico City, Mex., and in the seminar series on U.S. libraries and librarians, held in Rome, Florence and Naples, It., with the co-operation of the Italian Library association and the ministry of public instruction. The centennial anniversary of José Medina was celebrated by the Pan American Union.

An American library was established at the University of Dijon, Fr., in memory of John Erskine. A bomb was exploded in the U.S. Information Services Lincoln library in Buenos Aires, Arg. A serious fire in the Library of Parliament, Ottawa, Ont., disrupted extensive exchange relations with other American libraries and caused irreparable damage.

In the public library field, important but unspectacular progress was made in strengthening organized adult educational activities, including increased use of films and other audiovisual aids. The Newark, N.J., Public library opened an extensive science and technology division. Salina, Kan., established a *vocarium* for children, with spectacular success.

New public library buildings were opened, or were near completion, in Scarsdale, N.Y.; Newton, Mass. (an addition); Juneau, Alsk.; Tacoma, Wash. (new building started); and Garden City, N.Y. Many branch libraries were completed, were several buildings in smaller towns.

The national archives established four new centres, in Denver, Colo., Dallas, Tex., Atlanta, Ga., and St. Louis, Mo.—the latter was to contain personnel records of former civilian employees of the federal government. Other centres were located in Washington, D.C., New York city, Chicago, Ill., and San Francisco, Calif. The Army Medical library assumed the new title of the Armed Forces Medical library.

The Library of Congress released three long-playing records of American Indian music. These consisted of songs of the Sioux, Yuma, Cocopa, Yaqui, Pawnee and Ute tribes. Along with the volumes of Oscar Jacobson of the University of Oklahoma at Norman they constituted an important recognition of native American Indian culture.

An outstanding publication of the year was the 54-vol. set of "Great Books of the Western World," published by the *Encyclopædia Britannica* and The University of Chicago. (See GREAT BOOKS OF THE WESTERN WORLD.) Yale university issued the first of Gertrude Stein's unpublished manuscripts. The Library of Congress began publishing catalogue cards for motion pictures and film strips, five new albums of recorded poetry read by the poets themselves, and a monumental catalogue of 50,000 motion pictures registered in copyright 1912-39.

The Association of College and Reference Libraries established a new monographic series and the University of Illinois Urbana, began a new library quarterly, *Library Trends*.

Three new techniques of general significance were announced: the state of Michigan installed a state-wide teletype network for the public libraries; the Midwest Inter-Library centre teletype network began operation; and experimentation on Ralph Shaw's photoclerical process reached the point of demonstrated success.

Faulkner Studies, a new quarterly, announced its intention of increasing the reading and the understanding of William Faulkner's published works.

Many new college and university library buildings were reported during the year. The State University of Iowa dedicated its new modular building and the University of North Carolina dedicated a large addition. Youngstown college, O.; Lycoming college at Williamsport, Pa.; the College of St. Rose at Albany, N.Y.; and the New Orleans Baptist Theological seminary completed their buildings. Baylor university, Waco, Tex., opened its new Armstrong-Browning library and Queens college, Flushing, N.Y., started a new library to be named the Paul Kapper library in honour of the founder and president of the college. Kansas State Teachers college, Emporia, dedicated its William Allen White Memorial library.

Cornell university, Ithaca, N.Y., established a new rare book and manuscript department as did the State University of Iowa. Kent State university, Kent, O., offered a new undergraduate curriculum in library training, integrating library education with the student's field of specialization.

Among the special collections acquired by libraries were the following: Bryn Mawr college—the H. L. Goodhart mediaeval library of 1,000 volumes; Yale university—the papers of Henry L. Stimson, and the 1,000-vol. W. R. Coe library of ornithology; Library of Congress—a collection of Maxim Gorky's letters; the papers of Pres. William Howard Taft and 10,000 manuscript papers from Mrs. Woodrow Wilson; Columbia university—1,100 volumes on copyright law; Northwestern university—2,000-vol. collection of Africana; the University of California at Los Angeles—the Michael Sadleir collection of Victorian

novels; the University of Pittsburgh—a gift of \$75,000 for books from the Hartman estate; Dartmouth college—the deposit of the Vilhjalmur Stefansson library on the polar regions; West Virginia university—the Drylan Shakespearian collection of 7,000 volumes; Massachusetts Institute of Technology—the library of radio history from George H. Clark and the Radio Corporation of America; Princeton university—papers from the firm of Henry Holt & Co.; Wisconsin State Historical society—the McCormick collection of agricultural history; the University of Virginia—a complete set of the first edition of Edgar Allan Poe's works and manuscripts, letters, etc., from Clifton Barrett; Brown university—a \$100,000 gift from Mr. and Mrs. John D. Rockefeller, Jr., as a memorial to Arthur M. Allen, a classmate of Rockefeller; the University of Rochester—the papers of William H. Seward, secretary of state in Lincoln's administration; Brandeis university, Waltham, Mass.—a special Lincoln collection from Alfred W. Stern; the University of New Mexico—the 10,000-vol. library of Julia W. and T. B. Catron, specializing in the territorial law of New Mexico and the history of Spanish and Mexican literature; the University of North Carolina—a large collection of Thomas Wolfe's letters; the Bancroft library of the University of California—the letters of John C. Fremont and his family for the periods of 1877–84 and 1873–90, to add to Fremont materials already there. (See also AMERICAN LIBRARY ASSOCIATION; SOCIETIES AND ASSOCIATIONS, U.S.)

(R. E. EL.)

International.—The work of the Libraries and Documentation division of the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.) in 1952 fell into three main sections: public library development, bibliography and documentation, and the group of activities carried on by the Clearing House for Publications. The last-named issued the *Handbook on the International Exchange of Publications* (printed 1950, publication delayed), developed an information service on methods of documentary reproduction, and continued to publish the *UNESCO Bulletin for Libraries*. Within the technical assistance program the following projects were in existence or preparation: the development of the library of the Syrian State university, Damascus; the development of the university libraries of Iran, starting (in 1951) with the faculty libraries of science and medicine in Tehran; the creation of a Turkish national bibliographical centre in the National library, Ankara, primarily to supply scientific documentation to the institutes of seismology and hydrogeology established in Turkey by the technical assistance program but later to be extended to cover all subjects; the creation of a similar centre for Uruguay in the National library, Montevideo.

The Provisional International Consultative Committee on Bibliography met in Paris in April. It awarded contracts amounting to about \$5,000 to various individuals and library and documentation associations for a number of tasks.

Works issued or prepared for publication by the Libraries division in 1952 included, in addition to those already mentioned, volumes 1 and 2 of the revived *Index Bibliographicus* compiled by Theodore Besterman (published jointly by U.N.E.S.C.O., Paris, and the Fédération Internationale de Documentation, The Hague). Two supplements to the *UNESCO Bulletin for Libraries* (vol. 6, no. 2–3 and 5–6) were issued separately as a pamphlet entitled *UNESCO Survey of Microfilm Use 1951*.

The U.N.E.S.C.O. Department of Social Sciences organized a meeting of the Co-ordinating Committee on Documentation in the Social Sciences in March, which allocated money granted by U.N.E.S.C.O. as subsidies to various bibliographical publications in this field. The first issue of a new bilingual quarterly, *Current Sociology*, planned to consist of bibliographies and

KINDERGARTEN children with a rabbit borrowed from an animal lending library of the California Junior museum in Sacramento. Designed to let children learn first hand about U.S. wildlife, the library's pets were lent to children and schools at the rate of about 20 per week in 1952

trend reports in alternate issues, comprised an international bibliography of sociology from January 1 to June 30, 1951. A statistical pamphlet, *Basic Facts and Figures*, included useful information on libraries, book production and newspapers. Among other publications were an *International Repertory of Social Science Documentation Centres and Theses in the Social Sciences*, an *International Analytical Catalogue of Unpublished Doctorate Theses, 1940–1950*.

Great Britain and Ireland.—Statistics collected by the Library association showed that in the financial year 1950–51 £2,305,000, or 11d. per head of population, was spent on books for public libraries. The total cost of the service was £9,130,000 or 3s. 7d. a head—a rise of about £500,000. The population served totalled 50,100,000 and the number of books lent for home reading was 314,100,000—an increase of 8,000,000. The number of full-time staff employed was 11,300. In Northern Ireland the number of people still without library service was reduced to 1,500 by the opening in County Antrim of county library branches at Ballycastle and Lisburn. The building of the National Central library in Malot Place, London, the

greater part of which was destroyed in an air raid on April 16, 1941, was reopened on June 20 by the earl of Elgin, who had in 1933 handed to King George V the key of the same building at the original opening ceremony. Interlibrary loans through the National Central library, the Scottish and Irish Central libraries, and the regional library systems totalled 292,000 volumes in 1950-51 (compared with 291,000 in the preceding year).

Replies received up to June to a questionnaire circulated by the Library association to 582 public libraries in April gave the following information on postwar library building: permanent buildings, including prefabricated structures designed as libraries: 4 central libraries and 40 branch libraries completed; extensions and alterations of existing buildings: 77 schemes completed; adaptations as permanent libraries, including conversion of shops, etc.: 109 schemes completed; adaptations as temporary premises: 225 schemes completed; buildings started: 68 schemes, mostly extensions and alterations; buildings projected: 17 schemes licensed; 49 schemes deferred because of refusal of licence. Incomplete figures of real or estimated cost gave a rough total of £1,100,000. The Library association celebrated its 75th anniversary at the annual conference at Bournemouth in April and May under the presidency of L. R. McColvin.

The Library association published in London vol. 15 (1948) of the *Year's Work in Librarianship*. Butterworth Scientific Publications published the third edition of the *World List of Scientific Periodicals Published in the Years 1900-1950*. The Oxford University Press issued Sir Herbert E. Crastor's *History of the Bodleian Library, 1845-1945*.

Commonwealth.—The prime minister's bill for the establishment of the National library of Canada was passed unanimously by the Canadian parliament on May 20. The site itself was still under consideration, but preliminary work was well advanced at the Canadian Bibliographic centre in Ottawa, where the national union catalogue already contained more than 500,000 cards by the end of 1951. A seminar for library training was held in Australia from February to June, attended by librarians from Australia, India, Indonesia and the Philippines. A temporary extension of the overcrowded buildings of the University of Melbourne library, Melbourne, Austr., was opened in Dec. 1951, at a cost of about £30,000. The National Library centre of New Zealand, forming part of that country's National Library service, completed preliminary work on its union list of serials in New Zealand libraries and expected to send the copy to press at the end of 1952.

Other Countries.—The Direction des Bibliothèques de France initiated a scheme for a union catalogue of foreign acquisitions in French libraries, to be established in Paris with regional union catalogues in the provincial university libraries. Leon Carnovsky, professor of library science, The University of Chicago, Ill., made an extensive study tour of European—particularly French—libraries in 1951-52. A seminar on American libraries and librarianship was held in Rome, Florence and Naples, It., from March 24 to April 3 by the Fulbright Commission for Italy and certain other bodies in co-operation with the Italian Library association. Italian statistics classified the libraries of Italy at the beginning of 1952 as follows: state, 37, including 2 national central, 5 national and 12 university libraries; provincial and municipal, 193; public, 1,922; total, 2,152. Martin Bodmer, vice-president of the International Red Cross, bought for his private library in Geneva, Switz., the Rosenbach collection of more than 70 Shakespeare folios and quartos. The Stadtbibliothek (Vadiava), St. Gallen, Switz., celebrated its 400th anniversary. From Vienna, Aus., appeared the first issue of *Biblos*, an Austrian journal of librarianship, edited by J. Stummvoll. The Deutsche Gesellschaft für Doku-

mentation arranged conferences in Hamburg and Kiel, Ger., in September.

Statistics in the Jan. 1952 issue of *Bibliotekar'* gave the holdings of the Lenin State library in Moscow, U.S.S.R., as 14,500,000 vol. (1,000,000 in 1914; 9,600,000 in 1940). The library receives by law three copies of every book published in the union; the statistics presumably include duplicate copies.

The Turkish Library association issued the first number of *Türk Kütüphaneciler Derneği Bülteni*, edited by Adam Ötügen, a well-produced journal covering a wide field of interest. The library of the Greek patriarchate at Alexandria celebrated its millenary. The foundation stone was laid on Jan. 28 of a new Cuban National library building in Havana, and preliminary plans were made in Japan for a new national diet library in Tokyo to house 10,000,000 vol. (F. L. K.)

Libya. An independent kingdom in North Africa, the United Kingdom of Libya is bounded north by the Mediterranean, west by Tunisia and Algeria, south by French West Africa and French Equatorial Africa and east by Egypt and Sudan. Area: 679,340 sq.mi. Pop. (1951 est.): 1,124,000; Berbers, with Arab admixture. Language: Arabic. Religion: mostly Moslem. Chief towns (pop., 1950): Tripoli (140,000); Benghazi (62,300). Ruler: King Idris I; prime minister in 1952: Mahmud Bey Muntasser.

History.—Libya applied for membership in the United Nations on Jan. 3, 1952, but by the end of the year was still on the "waiting list." The U.N. commissioner's task ended with the proclamation of sovereignty on Dec. 24, 1951; in his report to the sixth session of the U.N. general assembly he stated his belief that the machinery devised for the achievement of independence had proved adequate, but that it had not stressed the economic, financial and social problems. The general assembly subsequently requested the Economic and Social Council

LIBYAN WOMAN carrying a prized possession with her to safeguard it from looters during rioting in Tripoli, which followed the general elections of Feb. 1952

to consider the grant of additional assistance to finance Libyan development programs.

General elections were held in each of the three provinces in February. In each the provisional government was confirmed in power and only in Tripolitania was there any disorder. There 17 people were killed in rioting apparently engineered by the opposition. This led to the dissolution of the Congress party, the deportation to Egypt of the well-known politician Bashir Sa'adawi and three of his associates, and the trial and conviction of those who had organized the disturbances. The Libyan parliament met in Benghazi in March and the speech from the throne read by the prime minister, Mahmud Muntasser, paid a tribute to the work of the former administering authorities and the United Nations, and made friendly references to foreign interests. The necessity to improve relationships between the three provinces was recognized; they still tended to regard themselves as separate entities. The king added "amir of Cyrenaica" to his title to show his special relationship to that province. The first meeting of the Libyan council of governors took place in Cyrenaica in August.

The political events in Egypt had no repercussions in Libya although general approval of them was expressed. Titles were abolished in keeping with the action taken in other Arab states. There was some general discussion about treaties with the British and U.S. governments, particularly concerning the military forces of those powers in Libya, but nothing definite in this direction had happened by the time parliament adjourned in August.

The exodus of Jews from the country continued.

Apart from the political disturbances in Tripolitania the kingdom was peaceful. It was still feeling its way while the democratic machinery designed for it was beginning to operate. It could still count on the parental sympathy of the United Nations in finding a way to overcome the lack of financial and material resources and to attain viability and complete independence.

(F. E. ST.)

Education.—(1950). Schools (excluding Italian): primary 141, pupils 23,915, teachers 840; elementary (Cyrenaica only) 45, pupils 5,399, teachers 190; secondary (boys only) 3, pupils 650, teachers 47; community (mixed; Cyrenaica only) 3, pupils 156, teachers 14; Koranic 413 (approximately), pupils 1,930, teachers 413; trade school 1, pupils 30, instructors 17; instructional centres in *zawais* (monasteries) 39, pupils 760, instructors 39. Italian schools: primary 97, pupils 7,279, teachers 347; post-primary 8, pupils 1,152, teachers 104. The number of government Jewish schools decreased rapidly because of emigration. Teachers' training colleges 2, students 120, lecturers 12.

Finance.—Budget (1950–51, actual): revenue £2,574,590, expenditure £2,950,590. Monetary unit: Libyan pound, at par with sterling, divided into 100 piastres.

Foreign Trade.—*Tripolitania* (1951 est.): imports £6,884,000; exports (including re-exports) £2,411,000. *Cyrenaica* (1949): imports £1,894,400; exports £1,565,400. Main imports included: metals; manufactured goods; tea; wine and spirits. Main exports included: esparto grass; hides and skins; goat and camel hair; wool and woollen goods; cattle, sheep and goats; vegetable oils; cigarettes and tobacco; dried and fresh fruit and vegetables; tunny fish; worked aluminum.

Lie, Trygve (1896–), Norwegian diplomat and United Nations official, was born on July 16 in Oslo. Between 1922 and 1940 he was identified with the Norwegian Labour party as its legal adviser and later as a member of its national council. From 1935 to June 1939 he was minister of justice, then minister of commerce; after the German invasion of Norway he went with the exile government to London, serving as its minister of foreign affairs. He was reappointed minister of foreign affairs of Norway in 1945. He served as chairman of the commission that drafted the charter for the Security council at the United Nations organization conference at San Francisco, Calif., and at the London meeting of the U.N. general assembly he was elected secretary-general on Feb. 1, 1946.

In his capacity as top U.N. administrative official Lie sought constantly to steer a neutral course between the aims of the

U.S.S.R. and its satellites and those of the western nations. He was instrumental in the application of U.N. sanctions against the North Koreans when they invaded South Korea, but his principal U.N. role was that of mediator in the effort to bring about peace in Korea. In Feb. 1951 Lie began serving a three-year extension of his original five-year term as secretary-general of the U.N., although he was not recognized by Russia.

Reviewing accomplishments of the U.N. general assembly session held at Paris, Fr., from Nov. 6, 1951, to Feb. 5, 1952, Lie declared on Feb. 8 that the danger of general war was "much less" than it had been a year before. Later, however he expressed pessimism about the outlook for a truce agreement in Korea. On July 3, 1952, he addressed the Austrian parliament in Vienna, pledging that he would do all he could to bring about Austria's admission to the U.N.

On Nov. 10 Lie submitted his resignation as secretary-general and proposed that a successor be selected who had the support of all the permanent members of the Security council and could therefore expedite a truce in Korea. Lie's resignation, however, would not become effective until the successor was agreed upon.

Liechtenstein. A small independent principality between Switzerland and Austria, Liechtenstein has an area of 61.4 sq.mi. Pop. (1951 est.): 14,000. Language: German. Religion: Roman Catholic. An elected *Landtag* of 15 members appoints the government. Capital: Vaduz (pop., Dec. 1950, 2,700). Ruler: Landesfürst (sovereign prince) Franz Josef II; prime minister (from Sept. 3, 1945): Alexander Frick.

Education.—Schools (1950–51): primary 14, pupils 1,658, teachers 50; secondary 2, pupils 156, teachers 8.

Finance.—Budget: (1950 actual) revenue 5,031,751 fr., expenditure 6,108,807 fr.; (1952 est.) revenue 5,540,500 fr., expenditure 5,560,600 fr. Public debt (Dec. 31, 1950): 8,033,800 fr. Included since Jan. 1924 in the Swiss customs union, Liechtenstein uses Swiss currency. The exchange rate in Aug. 1952 was 4.289 fr. to the U.S. dollar.

Agriculture.—Chief products: wheat, fruit, wine. Livestock (April 1950): cattle 5,658; pigs 3,397; sheep 699; goats 694; horses 340; chickens 32,160.

Industry.—Cotton weaving and spinning, leather goods, pottery, artificial teeth.

Limes: see FRUIT.

Linen and Flax. Flax fibre production increased in most producing countries of the world during 1951. In western Europe, the largest producer, France, increased its output by 31%; while Belgium, the second largest producer, enjoyed an increase of 40%. Although the Netherlands was the third largest producer, it recorded the largest percentage increase, 62%; whereas the United Kingdom, fourth largest producer, had an increase of only 12%. There were no reports on production in U.S.S.R. which, in the period 1934–38, accounted for four-fifths of total world production of flax fibre.

The British linen industry shared in the general European textile recession in 1951. Government contracts for linen fabrics in connection with the rearmament program offered some relief, but the rapid advance in raw material prices in 1951 aggravated by wage increases in all sectors of production led to higher prices and decreasing international demand. Exports of linen piece goods from the United Kingdom during July 1952 were valued at £870,121, compared with £1,153,171 for the cor-

New Zealand	1,156	1,038	898

*First nine months only.

responding month of 1951. Exports to the United States during July 1952 were valued at £207,838, compared with £404,794 in July 1951. Exports to Australia also registered a substantial decline, but those to Brazil, valued at £107,227 in July 1952, were almost double those of the same month of the previous year. The principal importing countries of British linen goods in order of importance are shown in Table II.

Promotional activities of the linen industry continued in 1952 with an estimated payment of \$42,000 by the Northern Ireland ministry of commerce to the Irish Linen guild as a grant-in-aid to support the cost of publicity in the United States during the first eight months of 1952. This supplemented the guild's main source of income, the linen industry itself. (I. L. BL.)

Liquors, Alcoholic. Federal excise taxes on distilled spirits were increased from \$9.00 to \$10.50 per proof gallon effective Nov. 1, 1951. After that date, gallonage sales declined sharply and as a result the new tax rate failed to meet revenue expectations. Congress premised its \$1.50 increase in rate on the assumption of an estimated gallonage sales level of 174,000,000 tax gallons which was to yield \$1,822,000,000 in the first full year of the tax. In the first ten months of its operation, ending Aug. 1952, revenue collections amounted to \$1,291,400,000 and it appeared that the full year's revenue might fall below 1950-51 collections at the \$9.00 tax.

During the same period sales declined sharply. Total gallonage tax paid for the first ten months at the higher rate was 14.2% less than that for the corresponding months ending Aug. 1951 and 2.8% below the average for the same months in the years before the Korean war. Declining gallonage sales also caused a reduction in state tax collections from distilled spirits as well as in federal and state income tax collections. The \$10.50 federal excise tax alone amounted to 43% of the average selling price for a fifth of 86.8 proof blended whisky. Combined federal, state and local taxes on the bottle amounted to 56% of the selling price.

Consumption, withdrawals and production of distilled spirits fell off sharply in the fiscal year 1952 from levels established in the preceding year. To develop inventories large enough to ensure adequate whisky supplies in the event of another full-scale war, spirits production was stepped up in fiscal 1951 by 68%. By the close of fiscal 1951, distilled spirits in government-bonded warehouses amounted to 901,000,000 gal. compared with 708,000,000 original entry gallons at the close of fiscal 1950.

Production of distilled spirits was accordingly curtailed dur-

Table I.—Production of Distilled Spirits

	(In proof gallons)		Per cent change 1951 to 1952	Average, fiscal 1948-50	Per cent change, 1948-50 to 1952

Total	221,875,432	401,452,796	-44.7	239,634,964	-7.4

*Previously included in spirits.

Table II.—Taxpaid Withdrawals of Distilled Spirits

	(In tax gallons)		Per cent change 1951 to 1952	Average, fiscal 1948-50	Per cent change, 1948-50 to 1952
	Fiscal 1952	Fiscal 1951			
Whisky	64,909,086	76,442,149	-15.1	55,592,499	+16.8
Neutral spirits	65,469,233	86,588,794	-24.4	82,573,653	-20.7
Brandy	2,674,788	2,822,047	-5.2	1,913,263	+39.8
Gin	8,217,305	8,375,304	-1.9	3,974,707	+106.7
Rum	302,724	289,340	+4.6	296,120	+2.2
Vodka	219,214	107,554	+103.8	*	*
Total	141,792,350	174,625,188	-18.8	144,350,242	-1.8

*Previously included in spirits.

ing fiscal 1952. Total output amounted to 221,875,432 gal., a reduction of 44.7% from the 401,452,796 gal. turned out in fiscal 1951, and of 7.4% from the average of 239,634,964 gal. produced in the fiscal years 1948-50. Despite cutbacks in production, however, stocks of distilled spirits remaining in internal revenue bonded warehouses as of June 30, 1952, amounted to 937,155,887 original entry gallons—4% more than the record inventory of fiscal 1951.

Taxpaid withdrawals of all distilled spirits in fiscal 1952 were 141,792,350 gal., 18.8% less than the 174,625,188 gal. withdrawn in fiscal 1951, and 1.8% less than the average of more than 144,000,000 gal. in the fiscal years 1948-50. These declines were attributable both to the excessive inventories accumulated by wholesalers and retailers in fiscal 1951, and to declining consumption.

In fiscal 1952, bonds and straights accounted for 30.2% of total whiskies bottled, while spirit blends accounted for 69.8% of the total. Whiskies of all types amounted to 85% of total distilled spirits bottled in fiscal 1952. Gins accounted for 8.3% of bottled output, brandy for 1.7%, cordials and liqueurs for 3.3%, vodka for 1%, and other items, including rum, for .7%.

Scotch whisky, imported from the United Kingdom, amounted to 9,600,000 gal. in fiscal 1952, Canadian whisky imports totalled 7,200,000 gal., and imports of brandy amounted to 902,362 gal. Imports of rum in fiscal 1952 amounted to 1,960,000 gal., of which 1,400,000 gal. originated in Puerto Rico.

(A. J. LI.)

Liquor Control.—The most dramatic, and perhaps the most important development in the field of liquor control in the United States during 1952, was the passage, by congress, and approval by the president, of the so-called McGuire act, which legalized fair trade. Fair trade is the name of the system under which a distiller or brand owner makes a contract with a retailer for sales by the retailer at not less than a minimum price; in other words it puts a floor under prices to the consumer. Under this system a contract with one retailer, with proper notice, binds all retailers.

Prior to the passage of this act, the supreme court of the United States had declared, in the so-called New Orleans Schwegman case, that a minimum price contract made by a distiller with one retailer did not bind all retailers. This made separate contracts with each retailer necessary. The McGuire act gave to the individual states the power to pass fair trade laws, thus restoring the situation to its original status.

Fair trade may be either compulsory or voluntary. If compulsory the state control authority has power of enforcement. If voluntary, the distiller may enforce his contracts through the courts.

The passage of the McGuire act did not, however, end the controversy. The constitutionality of the new law had yet to be passed upon, and the opponents of the system had not given up. Difficulties arose in enforcement. Some distillers listed as many as 60 items in their contracts while others listed only 3 or 4. Enforcement was not only difficult when a variety of items was involved, but was also difficult with respect to a strong retailer whose business added materially to total volume.

Federal price control in the liquor field antedated 1952, but was greatly modified in that year. Freeze controls (prices frozen as of a certain date) were succeeded by formula controls. Controls were lifted, after the early months of the year, on off-premise sales (package sales) of hard liquor and wine. On all alcoholic liquors sold by the drink, however, prices remained under control, and posting of prices was required. Enforcement was not too difficult, since in most areas prices were below ceiling prices. However, many retailers complained of difficulty in figuring the allowable markups. Confusion was caused by formulas which were of necessity somewhat complicated. (See also BREWING AND BEER; INTOXICATION, ALCOHOLIC; WINES.)

(M. Lb.)

Literary Prizes.

The following is a selected list of literary prizes awarded during the year of

1952.

UNITED STATES.—ACADEMY OF AMERICAN POETS.—\$5,000 fellowship to Padraic Colum.

AMERICAN ACADEMY OF ARTS AND LETTERS and NATIONAL INSTITUTE.—Gold medal for fiction to Thornton Wilder; gold medal for history and biography to Carl Sandburg.

AMERICAN ACADEMY OF ARTS AND LETTERS.—Prix de Rome fellowship of \$3,000 to William Styron.

AMERICAN POLITICAL SCIENCE ASSOCIATION, WOODROW WILSON FOUNDATION AWARD.—For the best book on government and democracy, to Samuel Lubell for *The Future of American Politics*.

AMERICAN POLITICAL SCIENCE ASSOCIATION, FRANKLIN D. ROOSEVELT FOUNDATION AWARD.—For an outstanding book on government and human welfare, to Josué de Castro for *The Geography of Hunger*.

AMERICAN POLITICAL SCIENCE ASSOCIATION, WILLKIE MEMORIAL-FREEDOM HOUSE AWARD.—For the best book in the field of international relations, to George Kennan for *American Diplomacy, 1900-1950*.

ANISFIELD-WOLF AWARDS.—Two awards of \$1,000 each, administered by the *Saturday Review of Literature*, focusing attention on racial relations, to Laurens van der Post for *Venture to the Interior* and Brewton Berry for *Race Relations*.

ATHENAEUM OF PHILADELPHIA AWARD.—For an outstanding literary achievement by a Philadelphian, to Arthur Hobson Quinn for *The Literature of the American People*.

BANCROFT PRIZES.—\$2,000 each annually for the best two books on American history, American diplomacy or American international relations, to Merlo Pusey for *Charles Evans Hughes* and C. Vann Woodward for *Origins of the New South*.

BOLLINGEN PRIZE IN POETRY.—\$1,000 prize awarded annually by Yale University library, to Marianne Moore for *Collected Poems*.

JOHN BURROUGHS MEDAL.—For a book of literary and scientific merit which stirs public interest in natural history, to Rachel L. Carson for *The Sea Around Us*.

CAREY-THOMAS AWARD.—Sponsored annually by *Publishers' Weekly* for the most distinguished publishing achievement of the year, to Houghton Mifflin Co. for *Life in America* by Marshall B. Davidson.

CATHOLIC WRITERS GUILD OF AMERICA, GOLDEN BOOK AWARDS.—To Richard Sullivan for *Fresh and Open Sky* (fiction), Thomas Merton for *Ascent to Truth* (spiritual) and Edmund Walsh for *Total Empire* (non-fiction).

CHRISTOPHERS' AWARD.—\$5,000 for works of enduring spiritual significance, to Fulton Oursler for *The Greatest Book Ever Written*.

COMMONWEALTH CLUB OF CALIFORNIA.—Gold medals to William Saroyan for *Tracy's Tiger* (fiction) and to Eric Hoffer for *The True Believer* (nonfiction).

FRIENDS OF AMERICAN WRITERS.—A \$1,000 annual award for the encouragement of young authors from the midwest, to Vern Sneider for *The Teahouse of the August Moon*.

GUGGENHEIM FELLOWSHIPS.—Among those awarded \$3,000 fellowships were Douglas Southall Freeman, Julian Boyd, Wallace Stegner, Hannah Arendt, F. W. Dupee, Jay Leyda, Frederick A. Pottle; and for creative writing, André Gide, Edgar A. Mitchell, John Berryman, Hortense Calisher, Robert S. Fitzgerald, William Goyen, Vladimir Nabokov, Byron Herbert Reece, Adrienne Rich and Richard P. Wilbur.

HARPER'S EUGENE F. SAXTON FELLOWSHIPS.—Edith Stuurman, for the completion of a volume of verse; Katherine E. Baccaro and Evan S.

Connell, Jr., for the completion of novels; Philip L. Ralph for the completion of a study of western civilization; and Eugenie Clark for the completion of a work in popular science.

HILLMAN FOUNDATION.—A \$500 award to Alan Barth for *The Loyalty of Free Men*. Similar awards in fields of journalism and magazine publication to Carl T. Rowan of the *Minneapolis Tribune* and Arthur D. Morse for an article in *McCall's Magazine*.

HOUGHTON MIFFLIN LITERARY FELLOWSHIP.—\$2,400 for financial assistance to promising writers, to Madison A. Cooper, Jr., for a first novel.

JEWISH BOOK COUNCIL.—Samuel H. Daroff fiction award, \$250 to Zelda Popkin for *Quiet Street*. Isaac Siegel Memorial award, \$250 for the best juvenile to Mrs. Sydney Taylor for *All-of-a-Kind Family*. Harry Kovner Memorial awards, \$100 each to A. M. Klein for *Hath Not a Jew and Poems*; to Mordecai Jaffe for *Anthology of Hebrew Poetry*; and to Hillel Bavli for his cumulative contributions to Hebrew poetry.

LAUTERBACH AWARD.—\$1,000 for the most substantial contribution to the cause of civil liberties, to William O. Douglas for his lecture "The Black Silence of Fear" published in the *New York Times Magazine*.

LIPPINCOTT FICTION PRIZE FOR YOUNG NOVELISTS.—To Eugene Walter for the manuscript of *The Untidy Pilgrim*.

LIVING CATHOLIC AUTHORS AWARD.—To Jacques Maritain for *Man and the State* (nonfiction) and to Graham Greene for *The End of the Affair* (fiction).

MYSTERY WRITERS OF AMERICA AWARDS.—Honorary "Edgars," busts of Edgar Allan Poe, awarded for mystery writing: for best first mystery, to Mary McMullen for *Strangle Hold*; for outstanding short story, to John Collier for *Fancies and Goodnights*; for true crime writing, to St. Clair McKelway for *True Tales from the Annals of Crime and Rascality*.

NATIONAL BOOK AWARDS.—Gold medals awarded by the entire book industry for distinguished fiction, to James Jones for *From Here to Eternity*; for nonfiction, to Rachel L. Carson for *The Sea Around Us*; and for poetry, to Marianne Moore for *Collected Poems*.

NATIONAL INSTITUTE OF ARTS AND LETTERS.—\$1,000 grants each to six nonmember writers for encouragement to young artists of ability and as practical recognition for more established authors: Saul Bellow, Alfred Hayes, Theodore Roethke, Elizabeth Spencer, Peter Taylor and Yvor Winters. (See also under *American Academy of Arts* for gold medal winners.)

NEW YORK DRAMA CRITICS CIRCLE AWARD.—Honorary awards given by the New York metropolitan critics for best play, to John Van Druten for *I Am a Camera* (based on Christopher Isherwood's *Berlin Stories*); best musical, *Pal Joey*; best foreign play, to Christopher Fry for *Venus Observed*.

PARENTS' MAGAZINE MEDAL.—For the outstanding book for parents, to Edith G. Neisser for *Brothers and Sisters*.

POETRY AWARDS.—Harriet Monroe Memorial prize of \$500, to Robert Lowell.

POETRY AWARDS OF CALIFORNIA.—\$1,250 to Carleton Drewry for *A Time of Turning*.

POETRY SOCIETY OF AMERICA AWARDS.—Gold medal and Alexander Drouzkoy Memorial award of \$100 to A. M. Sullivan; William Rose Benét Memorial award of \$100 to David McCord; Edna St. Vincent Millay Memorial award of \$100 to Sara Henderson Hay for *Delicate Balance*; Ridgely Torrence Memorial award of \$100 to Charles E. Eaton for *The Shadow of the Swimmer*; Poetry Chap-Book award of \$100 to Phyllis Bartlett for *Poems in Process*; Reynolds Lyric award of \$200 to Marcia Lee Anderson and Oliver Evans; annual awards, first prize, \$100, to Edna L. S. Barker and second prize, \$50, to Kimball Flaccus.

RUNG AWARD.—\$5,000 for novel emphasizing Christian living, to Elizabeth Patton Moss for *The Iranian*.

TAMIMENT AWARDS.—\$500 each to Whittaker Chambers for *Witness* and Merlo Pusey for *Charles Evans Hughes*.

NOBEL PRIZE FOR LITERATURE.—(See article NOBEL PRIZES.)

PULITZER PRIZES.—(See article PULITZER PRIZES.)

U.S. Children's Books.—CALDECOTT MEDAL.—For the year's most distinguished American picture book for children, to Nicolas Mordvinoff for illustrations of *Finders Keepers*.

CHILD STUDY AWARD.—No award in 1952.

CHARLES W. FOLLETT AWARD.—A prize of \$3,000 and a gold medal given by Wilcox and Follett, publishing company, for a worthy contribution to children's literature, to Reba Paef Mirsky for *Thirty-One Brothers and Sisters*.

HERALD TRIBUNE SPRING BOOK FESTIVAL AWARDS.—Three prizes of \$200 each: for a picture book, to Ann Nolan Clark for *Looking-for-Something*; for ages 8 to 12, to Natalie Savage Carlson for *The Talking Cat*; for older children, to John Reese for *Big Mutt*.

JUNIOR BOOK AWARDS.—Presented by the Boys' Clubs of America to authors of books which were favorites of boys in Boys' clubs throughout the United States. Medals to Wilbur J. Granberg for *Johnny Wants to Be a Policeman*; Sydney E. Fletcher for *The Cowboy and His Horse*; Alfred Powers for *A Long Way to Frisco*; Michael Gross for *Phil Sterling, Salesman*; Katherine B. Shippen for *Passage to America*; Hy Turkin and S. C. Thompson for *The Official Encyclopedia of Baseball*; Bob Allison and Frank Ernest Hill for *The Kid Who Batted 1,000*; Malcolm Johnson for *Bullard of the Space Patrol*; Holling C. Holling for *Minn of the Mississippi*; and Leland Silliman for *Bucky Forrester*.

JOHN NEWBERRY MEDAL.—For the year's most distinguished contribution to American literature for children, to Eleanor Estes for *Ginger Pye*.

ZONDERVAN JUVENILE AWARD.—\$1,000 prize for Juvenile Christian Fiction contest, to Craig Massey for *Flaming Valley*.

Canada.—GOVERNOR GENERAL'S AWARDS.—Silver medals awarded to Morely Callaghan for *The Loved and the Lost* (fiction); Josephine Phelan for *The Ardent Exile* (creative nonfiction); Frank MacKinnon for *The Government of Prince Edward Island* (academic nonfiction); Charles Bruce for *The Mulgrave Road* (poetry); John Hayes for *A Land Divided* (juvenile).

LEACOCK MEDAL FOR HUMOUR.—To Jan Hilliard for *The Salt Box*.

LORNE PIERCE MEDAL.—Awarded by the Royal Society of Canada for achievement of special significance and conspicuous merit in imaginative

or critical literature, to Hugh McLennan, author of *Each Man's Son*.
PRESIDENT'S MEDAL.—To Farley Mowat for "Lost in the Barrens" (best short story by a Canadian citizen in an English-language magazine).

TYRRELL MEDAL.—Awarded by the Royal Society of Canada for research in Canadian history, to C. B. Sissons, author of *Egerton Ryerson: His Life and Letters*. (A. J. RR.)

Great Britain.—Among the awards during 1952 were: the JAMES TAIT BLACK MEMORIAL PRIZES (about £250 each) to Noel G. Annan for *Leslie Stephen* (biography) and to W. C. Chapman-Mortimer for *Father Goose* (fiction); the CARNEGIE MEDAL (awarded by the Library association for an outstanding book for children) to Cynthia Harnett for *The Wool-puck*; the ROSE MARY CRAWSHAY PRIZE (£100, for a critical or historical work on English literature by a woman) to Ethel Seaton for her edition of Abraham Fraunce's *Arcadian Rhetorike*; the SOMERSET MAUGHAM AWARD (about £250 for a British writer under 30, to be used mainly for foreign travel) to Francis King for his novel *Dividing Stream*; and the DENYSE CLAIRON MEMORIAL PRIZE for the year's best translation from the French, to Denise Floliot for her translation of *Maira* by Julien Green. The Arts Council of Great Britain offered two prizes of £225 each for a first book of original English verse by a living poet published during the period Jan. 1, 1951, to June 30, 1953, and for a book of original English verse by a living poet published during the same period. (X.)

France.—Among the numerous literary prizes awarded in France during 1952 were: GENS DE LETTRES to Claude Aveline for his work as a whole and to Michiel de Saint Pierre for *La Mer à boire*; CRITIQUES to Georges Borgeaud for *Le préau*; VILLE DE PARIS to Jean Rostand for his work as a whole; MONACO to Henri Troyat for his work as a whole; AMBASSADEURS to André Billy for *Saint-Beuve*; GRAND PRIX DE LA MER ET DE L'OUEST-MER to Joseph Peyré for *Sang et Lumière* and *Guadalquivir*; GUILLAUME APOLLINAIRE to Alain Bosquet; ALBERT LONDRES to Georges Menant; COURTELINE to Pierre Daninos; CHRONIQUE PARISIENNE to Carmen Tessier; DEUX MAGOTS to René Jean Clot; ROMAN D'AVENTURES to Jean Kery; and PRIX DES NEUF DE DEAUVILLE to Emmanuel Berl. (A. PR.)

Lithuania. From Feb. 16, 1918, to Aug. 3, 1940, when it was annexed by the U.S.S.R., Lithuania, one of the Baltic states of northeastern Europe, was an independent republic. Area (including Klaipeda or Memel and Vilnius or Wilno territories): 25,173 sq.mi. Pop.: (Oct. 1939 est., including Vilnius, but excluding Klaipeda) 2,970,000; (1950 est., including Klaipeda) c. 3,000,000. Language: Lithuanian, Polish and Russian. Religion: Roman Catholic and Greek Orthodox. Chief towns (pop., 1938 census): Vilnius (cap., Oct. 1939 est., 207,800); Kaunas (152,365); Klaipeda (47,189); Siauliai (31,299). Chairman of the presidium of the supreme soviet in 1952: Justas I. Paleckis; chairman of the council of ministers, Mečislovas A. Gedvilas.

History.—On the 12th anniversary of the incorporation of Lithuania into the U.S.S.R., the Communist press published articles emphasizing the "historic changes in the life of the Lithuanian people." The Communist party membership amounted to 36,000. During the first five-year plan, 1946–50, wartime ruins were fully restored and production was higher than in 1940. The output of industry in 1950 was 87.5% larger than in 1940. In 1951 industry's share in the national economy amounted to 56%, compared with 35% in 1945. For the first time Lithuania began to produce metalworking machine tools, turbines and electrical equipment. There were three times as many employed in industry as in 1940.

As part of the five-year plan, 1950–55, a hydroelectric power station was to be built on the Niemen river at Kaunas and the port of Klaipeda was to be enlarged to accommodate larger sea-going vessels. As a result of the merger of small collective farms into bigger ones, the number of *kolkhozy* was reduced between July 1950 and July 1952 from 6,549 to about 3,000.

On May 10 *Izvestia* reported that a "Defense of Peace" conference of churchmen of the Soviet Union had been called at Zagorsk by the patriarch of Moscow. The presence of Mgr. Kazys Paltarokas, Roman Catholic bishop of Panevezys, refuted the rumour of April 1950 that he had died in a soviet prison.

The Soviet Telegraphic agency, Tass, reported from Wilno on Feb. 26 that in "districts with a Polish majority" Polish public libraries existed, lectures in Polish were being organized and Polish talking pictures were shown in theatres. According to *Sovietskaya Litva* there were 277 schools in the province of Wilno in which teaching was in Polish. (See also ESTONIA. LATVIA.)

Education.—Schools (1951): primary c. 3,200, pupils 459,000; secondary and technical c. 200, pupils 135,000; institutions of higher education 12, students 12,000.

Finance.—Budget (1952 est.): balanced at 1,471,051,000 roubles. (K. SM.)

Liver Disorders: see STOMACH AND INTESTINES, DISEASES OF THE.

Livestock. U.S. farms reported an increase in livestock at the beginning of 1952, compared with a year earlier, in all classes except dairy cows and, as usual, horses and mules. Value of livestock on U.S. farms reached a record of \$19,600,000,000 on Jan. 1, 1952, up from the 1951 record of \$17,100,000,000.

Cattle of the beef type, however, were outstanding in that they increased by about 6,000,000 head, and a further increase of significant magnitude to a total cattle level of approximately 93,000,000 occurred in 1952, leaving farmers, packers, meat consumers and economists with a major question, after four years of expansion, as to the nearness of the peak of the cattle cycle. There was agreement that cattle slaughter increased in 1952, with larger numbers to be marketed in 1953. Record numbers were on feed in midwestern feed lots during the year but the high price paid for feeder cattle late in 1951 or early in 1952, along with decline in fat cattle prices, meant little profit to feeders in 1952. It did mean, however, that the price which farmers were willing to pay for replacement feeder and stocker cattle was sharply lower with a widening margin compared with fat cattle, thus making more likely profitable feeding operations in 1953. The average price to farmers for beef cattle in September was \$23.80 per hundredweight compared with \$29.20 per hundredweight a year earlier.

U.S. cattlemen were very uneasy after an outbreak of foot-and-mouth disease in Canadian cattle in Saskatchewan in February, with recurrence in April. Though it was brought under control and trade in livestock was restored within Canada in late summer, strict exclusion of movement to the U.S. continued. Moreover, \$10,000,000 was appropriated for a laboratory to study the disease, to be located on Plum Island, off the Connecticut coast. The ban on importing cattle from Mexico was lifted in September and Mexico set an export quota of 500,000 head per year. Mexico in September reduced the 15% ad valorem surtax on live steers by about two-thirds.

The 1952 pig crop consisted of 56,607,000 spring pigs and an indicated 36,500,000 fall pigs, or a total of about 93,100,000 head, a sharp decline from the 102,189,000 head of 1951. Preliminary indications suggested a total of less than 90,000,000 head in 1953. The continued decline was associated with an unfavourable corn-hog ratio; i.e., relatively high corn prices and increasingly weak prices for hogs, a situation which it was anticipated would be little improved by the larger corn crop of 1952. Hog prices behaved in an abnormal manner in 1952.

Table 1.—Livestock on U.S. Farms
(In 000 head)

	Jan. 1, 1952	Jan. 1, 1951	Average 1941–50
Horses	4,370	4,993	8,130
Mules	1,923	2,074	3,100
Cattle (including calves)	88,062	82,025	79,460
Milk cows	23,407	23,722	25,900
Sheep	31,725	30,635	43,750
Hogs	63,903	62,852	61,990
Chickens	453,498	442,657	486,800
Turkeys	5,835	5,091	6,320

INFANT PIGS feeding on a synthetic sow's milk which made it possible to remove piglets from the sow 48 hr. after birth and reduce mortalities to 5% from an average of 18% to 35%. The new food was developed at the laboratories of Charles Pfizer & Co., Brooklyn, N.Y., in 1952

Table II.—Number of Livestock in Specified Areas
(in 000 head at beginning of year)

Areas	Cattle		Hogs		Sheep	
	1952	1951	1952	1951	1952	1951
North America . . .	123,100	116,500	82,000	80,000	40,300	38,900
Europe	100,600	99,500	75,700	72,300	120,700	118,400
U.S.S.R.	58,800	57,200	26,700	24,100	93,000	86,000
Asia	291,200	287,100	78,000	77,700	161,100	153,600
South America . . .	131,900	132,400	36,600	36,500	125,700	120,800
Africa	95,200	95,200	4,100	4,200	113,500	110,900
Oceania	20,300	20,600	1,900	1,800	154,000	149,900
Estimated world total.	821,100	808,500	305,000	296,600	808,300	778,500

The usual recession of late winter was deeper and more prolonged than usual, followed by very abrupt recovery in late spring without, however, the usual late summer peak and with deeper declines in the autumn than were expected considering the decreased numbers for market.

Sheep made slow progress in their comeback from record low numbers. Though lamb and mutton prices continued favourable, wool prices declined sharply.

World cattle, which numbered an estimated 821,100,000 head at the beginning of 1952, as compared with 743,100,000 before World War II, increased further during 1952. Reductions were mostly in some drought areas, chiefly in the southern hemisphere. The Australian cattle industry had a bad year, particularly in the Northern Territory. Large increases, other than in the U.S., were in India (4,000,000) and Brazil (4,000,000).

World hog numbers were estimated at 305,000,000 head at the beginning of 1952, 3% more than a year earlier and 5% above prewar levels. Western Europe had recovered prewar levels, but Argentinian pork production was reduced by drought damage to feed crops. No increase was anticipated in 1952, mostly because demand was not sufficient to provide incentive prices to counterbalance higher feed costs.

As of the beginning of 1952 the sheep population of the world was 808,300,000 head, 4% more than in 1951 and 3% more than the previous record number of 782,000,000 head in 1942. It was considered probable that the upward trend in numbers existing since 1947 ended in 1952, partly because of drought but also as a result of the sharp break in wool prices. Local Government: see MUNICIPAL GOVERNMENT.

Lodge, Henry Cabot, Jr. (1902–), U.S. senator, Mass., the grandson of Sen. Henry Cabot Lodge who led the opposition to U.S. entry into the League of Nations. He was graduated from Harvard university in 1924 and worked first with the *Boston Evening Transcript*, then with the *New York Herald Tribune* until 1932. He was a representative to the Massachusetts general court from 1933 to 1936 and in the latter year was elected U.S. senator from Massachusetts on the Republican ticket. Re-elected for another term in 1942, he resigned in Feb. 1944 to go on active duty with the U.S. army, and saw combat in North Africa and Italy. He was re-elected to the senate in 1946 for the term 1947–53. His voting record there revealed no clear trend, although he was generally typed as a "liberal Republican" and supported a number of New Deal and Fair Deal legislative measures.

In Nov. 1951 Lodge was picked by a group of Republican leaders to direct the Eisenhower-For-President drive. He directed the strategy that defeated Robert A. Taft on the key issue of disputed delegations at the Chicago, Ill., convention in July 1952 and led directly to Dwight D. Eisenhower's nomination on the first ballot. Lodge himself was defeated in the election for the senate on Nov. 4, but on Nov. 29 President-elect Eisenhower named him as U.S. representative to the United Nations, to succeed Warren R. Austin.

London. The early part of the year 1952 in London was inevitably overshadowed by the sudden death of King George VI at Sandringham in the early hours of Feb. 6. Grief and shock at the loss of the king did not exclude lively sympathy and eager loyalty for the new queen; and the pleasure of the crowds that witnessed the splendid ceremonial of the accession proclamation on Feb. 8 by garter king of arms, in company with the pursuivants and other heralds, at St. James's palace, Charing Cross, Chancery lane and the Royal exchange was not at all incompatible with a genuine feeling of personal loss. While the king's body lay in state for three days at Westminster hall, long queues waited to pay their homage, and vast crowds lined the route of the funeral procession from Westminster to Paddington. On June 7 the coronation proclamation for the holding of the coronation in 1953 was made by the officers of arms at the traditional stations at Westminster and the City.

ACCESSION of Queen Elizabeth II being proclaimed at Chancery lane, London, on Feb. 8, 1952, by a king of arms. First reading of the proclamation was at St. James's palace earlier in the day

In September the county council approved the County of London Development plan (1951). The plan would entail an expenditure of £540,000,000 and would take 20 years to execute.

The work of demolishing the exhibition buildings of the Festival of Britain proceeded briskly, and a broad riverside walk was constructed between Charing Cross and Waterloo bridges. The station-gate buildings of the exhibition were acquired by British European airways for a passenger terminal.

The net tonnage of shipping using the port of London for the year ending March 31, 1952, was 57,692,297 tons, in excess of 3,000,000 tons more than in the previous year, and only 4,000,000 tons less than in 1939. The total tonnage of goods passing through the port, 39,938,762 tons, was about 4,000,000 tons more than in 1951 and about 6,000,000 tons more than in 1939. Repairs to war-damaged wharves and locks continued.

Further explorations into Roman London resulted in a clearer conception of the date and dimensions of the fort recognized in 1950 in the Cripplegate-Aldersgate area; it was regarded as definitely older than the Roman wall in which it was incorporated. Excavations for the foundations of the new Lloyd's building in Lime street located the remains of an imposing Roman building, itself built over the burned remains of an earlier structure, testifying perhaps to the rebuilding of Roman London after the devastation of Boadicea's rebellion.

A notable exhibition was held at the Royal academy in celebration of the 500th anniversary of the birth of Leonardo da Vinci. An unusual exhibition, sponsored by the Arts council, was that of copies by Italian craftsmen of figures from the 5th- and 6th-century mosaics at Ravenna. An addition to London's museums was made in July by the opening of Apsley house, a residence of the duke of Wellington from 1817, as a permanent Wellington museum.

The Battersea pleasure gardens reopened experimentally for the summer months on May 24 and closed on Oct. 18, the attendance having reached only 2,500,000, compared with more than 8,000,000 in 1951.

Lords, House of: see PARLIAMENT, BRITISH.

Los Angeles. In 1952 Los Angeles adopted an official city flower, the bird of paradise (*Strelitzia regina*), and an official pronunciation of its name (loss an' ju less).

On the basis of figures for the first nine months of the year it appeared that Los Angeles county would (1) exceed its record in investments for industrial development, (2) set a record in the number of conventions held during any one year of its history, (3) set a new high in department store sales, and (4) come up with its third greatest residential and commercial building period in history.

Through the first three quarters of the year, dollar investments in Los Angeles county industrial expansions totalled \$293,187,456, or 21% greater than the \$230,669,808 spent during the same quarters of 1951. The year's investment total in industry, with three months yet remaining, was within \$15,000,000 of the record of \$308,349,871 established for the year 1951.

The number of conventions held during 1952 was 203, a total exceeding by 13 the previous high of 190 conclaves held in 1950.

Department store sales during the first nine months of the year exceeded by 5% the previous record established in 1948.

Construction valuations of \$677,042,839 for 138,613 permits during the first nine months of 1952 were 4% greater than the \$648,391,242 spent on building during a corresponding period in 1951. Enough residential permits had been issued at the end of nine months to house 178,400 persons.

During 1952 the area had its greatest rainfall in 63 years, at a time when this rain was badly needed. There were also several earthquakes, none of which caused much serious damage.

While Los Angeles county showed a 23% increase in farm production valuations, it lost, for the first time since 1910, its rank as the leading farm county in the nation. The area was passed by the other California counties of Tulare, Kern and Fresno.

Concern was expressed by civic leaders about the lagging freeway program within the metropolitan Los Angeles area. Original 1947 estimates of the length of time and the cost necessary to finish 165 mi. of minimum freeway construction were expanded. Nevertheless progress continued on the badly needed highway strips.

(T. C. D.)

Louisiana. One of the west south central states of the United States, admitted to the union in 1812 as the 18th state, Louisiana is popularly known as the "Pelican state," "Creole state" or "Bayou state." Area 48,523 sq.mi., of which 45,162 sq.mi. are land. Pop.: (1950 census) 2,683,516, of which 1,796,548 or 67% were white and 886,968 or 33% non-white; 1,471,696 or 54.8% urban and 1,211,820 or 45.2% rural. Capital, Baton Rouge (125,629). Other important cities: New Orleans (570,445), Shreveport (127,206), Lake Charles (41,272), Monroe (38,572), Alexandria (34,913), Lafayette (33,541).

History.—The year 1952 opened with the keenly contested Democratic gubernatorial primary campaign in its final stages. Unique features of this campaign were: (1) an unprecedented number of candidates (nine); (2) a Negro candidate, for the first time since Reconstruction days; (3) the first woman candidate; (4) a split in the "Long" ranks, with Gov. Earl K. Long supporting Judge Carlos G. Spaht, and his nephew, United States Sen. Russell B. Long, supporting Congressman Hale Boggs. In the first primary, Jan. 15, Spaht was first and Boggs third, with Judge Robert F. Kennon, an independent, second. Most of the candidates defeated in the first primary threw their support to Kennon in the second primary, Feb. 19, in which Kennon defeated Spaht by a large majority. The April general election was a mere formality, although for the first time in half a century a Republican candidate for governor made an active

ampaign.

The legislature met in regular 60-day biennial session on May 5, and on May 12 Robert F. Kennon was inaugurated as governor along with the other newly elected state officers. The session was relatively harmonious, and most of the Kennon "reform" program was speedily enacted into law. The state gasoline tax, highest in the nation, was reduced by two cents per gallon; exemptions on state income tax were raised to \$2,500 for single persons and \$5,000 for heads of families; claims of recipients of public welfare payments were required to be published; salaries of many state and local officials were increased; and larger appropriations than ever before were made for most state departments, agencies and institutions. Much of the Kennon program necessitated constitutional amendments, and 34 proposed amendments were submitted to the voters in the November election. Most important amendments were: reinstatement of state civil service, which had been established in 1942 and repealed in 1950; placing the state's largest spending agencies under nonpolitical boards of prominent citizens serving long, staggered terms, so as to prevent any future governor from politicalizing them; and reallocating certain state gasoline taxes to provide funds for constructing a Mississippi river bridge at New Orleans, a Red river bridge at Greenvale and badly needed access roads into New Orleans and other cities of the state.

On the national political scene Louisiana attracted some attention. Members of the state delegation to the Democratic National convention were at first denied seats because they refused in advance to agree to support the party nominees in the November election; but they were later seated under a compromise arrangement. The Democratic party in Louisiana was strongly "anti-Truman" because of the tidelands and FEPC issues. Governor Kennon announced his support of the Republican candidate for president, but most of the Democratic political leaders remained quiet or openly supported the Democratic nominee. In October for the first time in nearly a century both presidential candidates campaigned in Louisiana.

State officers in 1952 (after May 12) were: Robert F. Kennon, governor; C. E. Barham, lieutenant governor; Wade O. Martin, Jr., secretary of state; A. P. Tugwell, treasurer; Allison Kolb, auditor; Fred S. LeBlanc, attorney general; Shelby M. Jackson, superintendent of education; Ellen Bryan Moore, register of land office; Dave Pearce, commissioner of agriculture and immigration.

Education.—In the 1951-52 session the 797 public schools for whites enrolled 236,249 elementary and 72,862 high school pupils and employed 1,984 teachers; the 1,151 public schools for Negroes enrolled 168,388 elementary and 25,173 high school pupils and employed 5,577 teachers. The 173 private schools for whites enrolled 48,371 elementary and 10,244 high school pupils and employed 1,847 teachers; the 93 private schools for Negroes enrolled 18,448 elementary and 1,986 high school pupils and employed 493 teachers. The state operated 15 public trades schools in 1951-52, with 10 additional ones nearing completion. Total state expenditures for public education for the fiscal year 1951-52 were about \$95,000,000, of which \$15,000,000 was for institutions of higher learning; total educational budget for fiscal year 1952-53, \$115,000,000, of which more than \$20,000,000 was for institutions of higher learning.

Social Insurance and Assistance, Public Welfare and Related Programs.—Total benefit payments under the Louisiana unemployment compensation law were \$13,985,422 for the fiscal year 1951-52, compared with \$14,915,207 for the fiscal year 1950-51. Louisiana expended more than \$95,000,000 on public welfare in the fiscal year 1951-52, and appropriated \$15,000,000 for the 1952-53 fiscal year, the increase being the result

Table II.—Principal Crops of Louisiana

Crop	Indicated 1952	1951	Average 1941-50
Cotton (bales)	715,000	760,000	524,000
Cottonseed (tons)	290,000	309,000	215,000
Corn (bu.)	13,116,000	16,307,000	17,493,000
Rice (bu.)	25,822,000	25,164,000	23,810,000

of higher old-age pensions and payments in other categories.

In 1952 the state maintained eight charity hospitals, in addition to rental of beds in several private hospitals; three hospitals for mental patients; three tuberculosis sanitariums; a school for white blind, a school for white deaf and a school for Negro blind and deaf; a training school for spastic children; a training school for the feeble-minded.

The state maintained two prison farms for its 2,500 adult offenders, separate training institutes for about 200 delinquent white boys and girls and a training institute for about 100 delinquent Negro boys. The training institute for delinquent Negro girls authorized by the 1950 legislature was under construction.

State expenditures for maintenance, expansion and improvement of charitable and correctional institutions were \$26,400,000 for the fiscal year 1951-52, \$21,000,000 of which was expended on the charity hospitals and mental institutions.

Communications.—In 1952 Louisiana had 18,200 mi. of public highways, 14,800 mi. of which were state-maintained, 4,800 mi. paved with concrete or black top and the remainder gravelled. Total state expenditures for public highways were \$39,388,600 for the fiscal year 1951-52, exclusive of federal grants-in-aid, compared with \$38,107,460 appropriated for the 1952-53 fiscal year.

There were 4,400 mi. of railways and 4,800 mi. of navigable waterways. About 100 land airports and 10 seaplane bases were in operation in 1952. About 570,000 telephones were in service at the end of 1952.

Banking and Finance.—On Jan. 1, 1952, Louisiana had 36 national banks, with total deposits of \$1,382,833,000 and resources of \$1,469,986,000; and 130 state banks, with total deposits of \$639,111,000 and resources of \$679,704,000. There were 62 savings and loan associations, with total assets of \$227,178,188; 219 small loan companies, with total assets of \$34,359,533; and 89 credit unions, with total assets of \$3,555,184. Total state income for the 1951-52 fiscal year, exclusive of federal grants-in-aid, was \$257,925,125; expenditures for the same period were \$235,911,464. State bonded debt on July 1, 1952, was \$215,000,000.

Agriculture.—The total value of agricultural and truck crops in 1952 was estimated at \$300,000,000, compared with \$290,000,000 in 1951; total acreage harvested was 3,400,000, compared with 3,360,000 in 1951. The total cash income from crops, livestock and poultry and their products was estimated at \$450,000,000 in 1952, compared with \$445,000,000 in 1951; from government payments \$12,000,000, compared with \$11,584,000 in 1951.

Manufacturing.—More than 2,400 industrial establishments, employing 165,000 workers and paying \$360,000,000 in wages and salaries, produced finished products worth \$1,600,000,000 in 1952, compared with \$1,500,000,000 in 1951. During the year about \$150,000,000 of capital investments in new plants and expansions of existing ones was made, under the state law exempting new industrial plants from taxation for ten years.

Forest Products, Furs, Fisheries.—Louisiana forests produced about 1,150,000,000 bd.ft. of lumber and 998,000 cords of pulpwood in the 1951-52 fiscal year, compared with 1,164,940,000 bd.ft. and 941,754 cords in 1950-51 fiscal year.

The Louisiana fur harvest for the 1951-52 season was valued at about \$5,000,000, compared with \$5,957,248 for the 1950-51 season.

The total catch of Louisiana commercial fisheries—fish, oysters, shrimp, crabs and frogs—was valued at \$30,000,000 in 1951, compared with \$28,000,000 in 1950. It provided employment for about 30,000 men, and approximately 115,000 persons were dependent on the industry for a livelihood. (W. Pr.)

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Louisiana in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Louisiana ranks second among the states in the production of

Table III.—Mineral Production of Louisiana

(Short tons, except as noted)

Mineral	Quantity 1950	Value 1950	Quantity 1949	Value 1949
Clays	209,000	\$ 185,000	134,000	\$ 107,000
Natural gas (000,000 cu.ft.)	831,771,000	44,084,000	732,845,000	32,025,000
Natural gasoline (bbl.)	14,603,000	44,548,000	13,936,000	45,259,000
Petroleum (bbl.)	208,965,000	554,520,000	190,826,000	507,730,000
Petroleum gases (bbl.)	6,165,000	7,991,000	5,318,000	9,733,000
Salt	2,279,000	6,903,000	2,030,000	5,838,000
Sand and gravel	5,505,000	6,310,000	5,050,000	6,107,000
Sulphur	1,406,000	23,700,000	1,244,000	20,000,000
Other minerals		5,336,000		5,174,000
Total		\$693,607,000		\$631,813,000

natural gas and sulphur, and third in petroleum, and stands fifth in the value of mineral output, with 5.85% of the U.S. total.

Table I.—Louisiana Public Welfare Programs, 1951-52

Type of assistance	Average number on rolls	Cost for the fiscal year
Old-age pensions	119,500	\$68,435,821
Deaf-blind	2,450	1,020,373
Dependent children	85,600	15,760,698

Lovett, Robert Abercrombie

(1895-), U.S. government official, was born on Sept. 14 in Huntsville, Tex. He studied at Yale and at Harvard, served in the naval air arm during World War I and afterward became a partner in the banking firm of Brown Brothers, Harriman & Co. He was appointed special assistant to the secretary of war in Dec. 1940, and assistant secretary of war for air in April 1941. He returned to private business in 1945, but in May 1947 was appointed undersecretary of state. During absences of State Secretary George C. Marshall in 1947 and 1948, he was acting secretary of state, and as such helped further co-ordination of western Europe's political and economic activities. His resignation from the department was accepted along with Marshall's on Jan. 7, 1949.

Lovett again served under Marshall when, in Sept. 1950, he was appointed deputy secretary of defense, and Marshall was made secretary of defense. Upon the latter's resignation a year later, Lovett was elevated to that position. He was sworn in Sept. 17, 1951.

In his first semiannual report on U.S. defense, issued March 15, 1952, Lovett declared that the United States would tolerate no appeasement in return for a truce in Korea.

Lumber. **United States.**—Lumber production in the United States during 1952 was maintained at the relatively high level shown in 1951. The major factors in this production were continued housing activity, industrial construction and requirements for the military and preparedness programs. Other factors were rural building and construction, railroad requirements, export trade and an active furniture, radio and television cabinet market. Total lumber production for 1952 was estimated at 37,500,000,000 bd.ft.

The leading lumber species cut were, in order of importance, southern pine, Douglas fir and ponderosa pine, which together comprised about 64% of the total volume. Other leading species, in order, were oak, hemlock, eastern white pine, red gum, white fir, yellow poplar, redwood, spruce, maple, tupelo, cedar, sugar pine, cottonwood (including aspen), beech, larch, Idaho white pine, cypress, birch and lodgepole pine.

About 81% of the total cut was of softwoods (pine, spruce, fir, etc.) and 19% was of hardwoods such as oak, maple, red gum, beech, etc.

White fir, larch, lodgepole pine, red gum and tupelo advanced in relative importance and some other species such as spruce, Idaho white pine, cypress and birch decreased in relative volume production.

About 46% of the total lumber production came from west of the Great Plains and 54% from the eastern states. This was true in spite of the fact that the three leading lumber producing states, in order, were Oregon, California and Washington. California lumber production was greatly increased by the activity of about 600 relatively new sawmills in the Douglas fir forests of the northern counties. Vast quantities of this species were shipped by rail and truck to the active building areas in the San Francisco bay region and in the Los Angeles and other districts of southern California. Other important species cut in California were ponderosa pine, redwood and the red and white firs. The greatest volume of Douglas fir came from Oregon and Washington.

The south continued as an active producing region in all states from Virginia to Texas. Both southern pine and hardwoods came from these states. North Carolina continued as an important lumber state in spite of the fact that its virgin timber had been largely cut more than 40 years before.

Maine continued as the most important white pine state. Very little virgin timber was cut anywhere in the United States

except in the Rocky mountains and on the west coast. The timber reserves of the United States were growing up at a surprisingly rapid and satisfying rate, largely because of fire protective and prevention measures and excellent management policies, especially on the part of the larger timber-owning concerns. The timber famine so widely predicted 40 to 50 years before had not arrived, nor was it threatening. A large share of the country's lumber supply, probably 60% to 70%, was by 1952 coming from regrowth timber. Some forests, notably in parts of Maine, New York and Pennsylvania, had been supplying continuous crops of timber for from 100 to 300 years. Many sections of the south had also produced successive crops for the past 60 to 100 years or more.

The tree farm movement sponsored by the lumber, plywood, pulp and paper and other timber-owning interests was active, continued and expanded. This movement had been responsible for a reawakening of interest in practising efficient and successful forest management on more than 25,000,000 ac. of productive forest.

More lumber was cut in 1952 by the small sawmills, that is, those cutting up to 10,000 bd.ft. per day, than by the larger sawmills. There were, however, some mills that had a capacity of from 300,000 to 1,000,000 bd.ft. per eight-hour day. Most of them were on a sustained-yield basis of continuous and perpetual production, since there were sufficient timber supplies, including current volume and prospective growth, to maintain these mills in constant production.

Prices for lumber were well maintained through the spring and summer, especially in the case of the better grades. Stumpage prices paid for standing timber were also well maintained compared with 1951 and previous years. This was notably true for national forest and Indian reservation timber. Delivered lumber prices continued at high levels because of higher freight rates and labour charges.

Substantial appropriations were made by congress to build and maintain access logging roads in the national forests, which were producing about 4% of the total annual lumber cut, compared with about 1% to 2% a few years before.

The year was marked by more intensive utilization of raw materials in all parts of the country. These practices included: (1) improved and enlarged prelogging and salvage or relogging, especially on the west coast where yields were 5% to 20% greater; (2) prebarking of logs prior to their sawing in the mill in order to obtain bark for conversion into materials such as adhesives, soil conditioners, cork substitutes and other products, as well as to produce cleaner logs for cutting into lumber, pulpwood or other products; (3) increasing use of chipped hogged slabs, edgings, trimmings and other mill refuse formerly lost or wasted, for paper pulp, fibreboards, hard board, fuel and other purposes; and (4) increasing use of low grades of lumber for pallets, boxes and crates and furniture cores; also for knotty panelling and interiors of dwellings. Some forms of knotty lumber and that with heart centres formerly considered defective or undesirable were recognized as architecturally desirable and beautiful. This was especially true of certain heartwood centres of Douglas fir, cypress, white pine, oak and chestnut.

(N. C. B.)

British Commonwealth and Europe.—The year 1952 saw the end of the long sellers' market in the timber-exporting countries of Europe and the commonwealth. The free-on-board prices of softwood, hardwood and plywood all fell considerably and c.i.f. (carried insurance free) values experienced an even greater setback because of a severe fall in freight rates. Among European exporters, Finnish shippers started the ball rolling by lowering their price for average redwood in May to £72 per standard f.o.b. When the Russians issued their stock sheet

shortly afterward, it was found that their price for unsorted redwood was £60 per standard f.o.b. The Finns made further cuts and by midsummer their price stood at £58 per standard f.o.b. This fall in prices was undoubtedly helped by the fact that the United Kingdom, through financial stringency, cut its softwood import quotas to about 450,000 standards as against 1,750,000 standards imported in 1951. The board of trade granted a measure of freedom to private importers of softwood by permitting them to buy direct, but under a very restricted global quota. The combined effect of all this was not only to shake down prices in other softwood-exporting countries in Europe such as Yugoslavia, Poland and Czechoslovakia, but also seriously to affect the Canadian export market. There matters were complicated by the fact that the British Timber control had made forward contracts with Canadian exporters, covering a large part of 1952, and in the spring of the year their commitments were about 170,000 standards. These contracts were sold on c.i.f. terms to British importers at steadily reduced prices during the year, thus still further weakening the market position.

For the hardwood trade 1952 was also a period of considerable price adjustment. Prices for practically all the tropical hardwoods produced within the commonwealth fell sharply, helped in many cases by the fall in freight already mentioned which applied equally to hardwoods and softwoods. The market for west African timbers suffered particularly heavy falls, because under boom conditions production there had expanded beyond the capacity of normal consumption. For instance, Obechi, which at one time had been selling at more than £20 a ton f.o.b., fell during the year to a low level of £13 a ton f.o.b. Beech, one of the stable productions of the European hardwood trade, suffered falls ranging up to 20%. In the spring the French government announced the following export quota: sawn poplar, 25,000 cu.m., sawn oak, 15,000 cu.m., sawn beech, 8,900 cu.m., sawn ash, 1,500 cu.m., miscellaneous hardwoods, 15,000 cu.m. A large trade developed in soft hardwoods mainly from west Africa, Malaya and Borneo, which were used as substitutes for softwoods. Exports from these countries had a setback during 1952. In the first six months of 1952, 18,668,000 cu.ft. of hardwoods, both logs and lumber, were imported into the United Kingdom, compared with 26,675,000 cu.ft. for the same period in 1951.

Prices of plywood fell considerably in all the main producing countries. Gaboon plywood, one of the standard productions of France and its colonies, experienced falls in price ranging up to 33½%. British home-manufactured plywood was seriously reduced in price to meet competition from abroad. Finnish birch, which from its popularity for general utility purposes might almost be called a standard plywood, joined the general setback with a fall in price, according to grade, up to 20%.

A feature of 1952 was the holding of the sixth British Commonwealth Forestry conference at Ottawa, Ont., during August and September. This conference was attended by delegates from all the principal commonwealth timber-producing and consuming countries. (See also FORESTS.) (B. L.)

Lutherans. In 1952 the most important event among Lutherans was the Lutheran World Federation assembly at Hanover, Ger., where delegates, alternates and official visitors from 52 member churches in 25 countries on all continents met for ten days. They represented in excess of 46,000,000 of the more than 60,000,000 Lutherans in the world.

Bishop Hanns Lilje of Hanover, Ger., was elected the new president and Carl E. Lund-Quist of the United States was chosen executive secretary, both for five-year terms. The permanent office of the federation is in Geneva, Switz. Lutherans

of the United States invited the assembly's next meeting in 1957 to be held in the United States.

Three new departments of work were set up by the Lutheran World federation: (1) theology, to foster international understanding and appreciation of doctrine, (2) world missions, to co-ordinate global foreign missions, (3) world service, to strengthen joint work all over the world for refugees and people and churches in need.

Johannes Smemo replaced Bishop Eivind Berggrav as Bishop of Oslo, the primate of Norway. In the United States, the year 1952 saw initial steps toward organic merging of five Lutheran conference synods: the Evangelical, American, Augustana, Lutheran Free and United Evangelical Lutheran Churches.

The sum of \$500,000 was spent by the National Lutheran council and five national church bodies associated with it for the production of a feature-length dramatic film on the life of Martin Luther. Filming was done in Germany.

The Lutheran Television Productions committee of the Lutheran Church, Missouri Synod, produced a series of family films, *This Is the Life*, which began to be telecast on major networks and stations in Oct. 1952. With a budget of \$750,000 and much volunteer service, it was the most ambitious church undertaking in television up to that time. The National Council of Churches of Christ in the U.S.A. was to be the distributing agency.

Lutherans in the United States increased to somewhat more than 6,500,000. According to the National Lutheran council, which compiles these figures annually, this was an increase of approximately 4% over the previous year. The last five-year-average increase was 2.4%. (See also CHURCH MEMBERSHIP.)

(Jo. St.)

Luxembourg. An independent grand duchy in western Europe. Luxembourg is bounded south by France, northwest by Belgium and northeast by Germany. Area: 1,010 sq.mi. Pop.: (Dec. 31, 1947, census) 290,992; (mid-1951 est.) 300,000. Language: Luxembourgian (idiomatic) and (officially) French. Religion: Roman Catholic, 98%. Capital: Luxembourg (pop., Aug. 1949 est., 62,000). Ruler, Grand Duchess Charlotte; prime minister in 1952, Pierre Dupong.

History.—On May 13, 1952, the chamber of deputies ratified the treaty establishing the European Coal and Steel Community by 47 votes to 4 (Communist). On Aug. 10 a nine-member high authority of the E.C.S.C. was established in the city of Luxembourg. Albert Wehrer, Luxembourg minister to France, was appointed member of the high authority.

On May 27 Joseph Bech, minister of foreign affairs, signed in Paris the treaty establishing the European Defense Community. It was announced at the same time that the Luxembourg four battalions would be integrated with the Belgian armed forces. (See also EUROPEAN UNION.)

The output of iron ore increased during the first half of the year by almost one-quarter; it reached 658,000 tons in May 1952. The steel output slowed down slightly and the best month was January with 266,000 tons. In March only 13 people were registered as unemployed.

About 500 Soviet-built "Moskvich" cars and a considerable quantity of manganese ore were delivered during the year to Luxembourg by the U.S.S.R. in exchange for raw steel and rails. During the fiscal year ending June 30, 1952, the U.S. armed forces placed \$300,000 worth of orders in Luxembourg for "off-shore" purchases.

Education.—Schools (1949-50): elementary 944, teachers 1,012; higher elementary 22; secondary 10; technical 6; teachers' colleges 2; and an academy of music.

Finance.—Monetary unit: Luxembourg franc, at par with the Belgian franc, with an exchange rate of 50.50 fr. to the U.S. \$1 in 1952. Budget: (1951 est.) revenue 3,477,700,000 fr., expenditure 3,446,200,000 fr., (1952 est.) revenue 3,637,600,000 fr., expenditure 4,009,300,000 fr.

Luxembourg Industrial Production
(In thousand metric tons except as noted)

Product	1937-39	1945	1949	1950	1951	1952 (6 mo.)
Iron ore (metal content 30%)	6,252	1,404	4,152	3,828	5,628	3,498
Pig iron	1,968	312	2,376	2,496	3,158	1,553
Crude steel	1,908	264	2,268	2,448	3,072	1,512
Gas (million cu.m.)	—	11.6	17.8	17.3	17.8	8.9
Electricity (million kw.hr.)	507.6	177.6	620.4	697.2	809.0	421.0

Transport and Communications.—Railways (1950): 340 mi. (including 90 mi. narrow-gauge). Roads (1950): 2,673 mi. Motor vehicles registered (June 30, 1950): cars 9,204, commercial 4,525, motorcycles 4,880. Telephones: 20,287.

Agriculture.—Main crops: wheat, oats, potatoes. Livestock (Dec. 1951): cattle 124,230; pigs 119,680; horses 13,910; sheep 2,700; goats 1,240.

Industry.—Production is shown in the table.

Macao: see PORTUGUESE OVERSEAS TERRITORIES.

MacArthur, Douglas

(1880—), U.S. general of the army, was born on Jan. 26 at Little Rock barracks, Ark. (For his early career, see *Encyclopædia Britannica*.) After the Japanese attack on Pearl Harbor, MacArthur led U.S. and Filipino forces in defense of the Philippines until March 17, 1942, when Pres. Franklin D. Roosevelt ordered him to Australia. From this point he led the combined United Nations drive that ultimately led to a successful reinvansion of the Philippines. MacArthur himself accepted the Japanese surrender in Tokyo bay on Sept. 2, 1945, and as supreme commander of the Allied powers in Japan he carried out the occupation policies determined by the 11-nation far eastern commission. When the North Koreans invaded South Korea in June 1950, MacArthur was placed in charge of the United Nations forces opposing the aggression. When the Chinese Communists entered the war, MacArthur promptly informed the world that it was confronted by a new war.

When in March 1951 General MacArthur by implication threatened to bomb and blockade red China, in calling upon the red field commanders to discuss armistice terms, the first of a series of disagreements on policy with officials in Washington, D.C., emerged. The eventual outcome was MacArthur's removal by Pres. Harry S. Truman in April, and this led to an investigation of the background of such action, and of over-all U.S. foreign policy, instituted by the U.S. senate.

As keynote speaker of the Republican national convention at Chicago on July 7, 1952, MacArthur attacked the Truman administration's foreign and domestic policies for having brought the United States "fiscal instability, political insecurity and military weakness." He was nominated for the presidency at the convention but received only ten votes on the first ballot. On July 31, 1952, he became chairman of the board of Remington Rand, Inc., New York city, at a reported annual salary of \$100,000.

McCarran, Patrick Anthony

(1876—), U.S. senator, was born at Reno, Nev., on Aug. 8. He graduated from the University of Nevada, Reno, in 1901 and was admitted to the state bar in 1905, meanwhile (1903) serving in the Nevada legislature. At Tonopah, Goldfield and Reno he built a lucrative law practice, particularly during mining booms. From 1913 to 1917 he was associate justice of the Nevada supreme court and in 1917-18 chief justice. He resumed his law practice thereafter until 1932, when he was elected U.S. senator from Nevada on the Democratic ticket. He was re-elected for his fourth consecutive term (1951-57) in Nov. 1950. As chairman of the senate judiciary committee and the joint congressional ("watchdog") committee on foreign aid, McCarran wielded considerable influence in 1950-52 on domestic and foreign policy. He helped write the Internal Security (McCarran) act of 1950, and on Jan. 18, 1951, became

chairman of a senate subcommittee appointed to investigate administration of the act. The subcommittee later became a focus of national attention when it conducted hearings on U.S. policy in the far east. During these hearings McCarran became increasingly alarmed at the administration's methods for safeguarding internal security. On Aug. 5, 1951, he charged that Communist agents and sympathizers had ready access to top U.S. defense secrets.

McCarran was co-sponsor of the controversial immigration bill (McCarran-Walter Immigration and Nationality act) passed by the U.S. senate on June 27, 1952, over Pres. Harry S. Truman's veto. This act retained the quota basis of immigration fixed in proportion to nationalities in the existing U.S. population.

McCarthy, Joseph R.

(1909—), U.S. senator, was born Nov. 14 in Grand Chute, Wis. He graduated from Marquette university, Milwaukee, Wis., and practised law until 1939 when he was elected circuit judge. From 1942 to 1945 he served overseas with the U.S. marines, and during this time his name was put up by friends for nomination to the U.S. senate. Although he received 100,000 votes, he ran second. In 1945 he was re-elected circuit judge, and in 1946 he was elected to the U.S. senate. In the senate he was especially known for his investigations of communism in high places in government, and his frequent sweeping accusations caused his enemies to use the word "McCarthyism" to describe his type of investigations. He repeatedly scored the Truman administration for what he termed the failure of its policy in Asia, and called for the ouster of Gen. Douglas MacArthur "perhaps the greatest victory the Communists have ever won." Sen. William Benton (q.v.) (D., Conn.) in Aug. 1951 introduced a resolution calling for investigation of McCarthy's activities to decide whether he should be expelled from the senate. Senator Benton termed "McCarthyism" unjust and dangerous, and on Sept. 28, 1951, told the senate privileges and elections subcommittee that McCarthy should be ousted on the basis of ten charges that Benton detailed. On March 26, 1952, McCarthy instituted a \$2,000,000 libel suit against Benton.

In the national election of Nov. 4, 1952, he was returned to the U.S. senate for the term 1953-59.

McCormack, John William

(1891—), U.S. congressman, was born on Dec. 21 at Boston, Mass., and was educated in the public schools of Boston. He studied law in a private law office, was admitted to the Massachusetts bar in 1913 and began practice in Boston. He was a member of the Massachusetts constitutional convention in 1917-18, a member of the state house of representatives from 1920 to 1922, and state senator from 1923 to 1926, serving as Democratic floor leader for the last two years of his term. In 1928 he was elected to fill a vacancy in the U.S. congress (1927-29), and was returned to the house in each succeeding election. McCormack served as majority floor leader of the house from 1940 to 1947 and as minority whip from 1947 to 1949, when the Republicans controlled congress. After the Democratic victory in the national elections of 1948, McCormack was again elected majority leader (1949) and was re-elected to that post on Jan. 2, 1951. At the Democratic national convention in Chicago, Ill., in July 1952, he was named chairman of the committee on platform and resolutions.

McCormick, Lynde Dupuy

(1895—), U.S. naval officer, was born on Aug. 12 at Annapolis, Md. Graduating from the U.S. Naval academy at Annapolis in 1915, he rose through the grades to admiral. He

specialized in submarine warfare, and was made assistant war plans officer for the U.S. Pacific fleet in 1941. In 1943 he assumed command of the battleship "South Dakota" in the Atlantic, and later that year was transferred to Washington, D.C., where he held several administrative posts. He was a member of the staff of advisers at the Yalta conference of 1945. After World War II, Admiral McCormick was vice-chief of naval operations until his appointment, on Aug. 1, 1951, as commander of the U.S. Atlantic fleet to succeed Adm. William M. Fechteler. On Jan. 30, 1952, Pres. Harry S. Truman announced the appointment of Admiral McCormick as supreme commander of Allied naval forces in the Atlantic.

On April 10, 1952, he established the naval headquarters of NATO at Norfolk, Va.

Macedonia: see YUGOSLAVIA.

McGranery, James Patrick (1895-), U.S. cabinet member, was born on July 10 at Philadelphia, Pa. During World War I he was an observation pilot with the U.S. air corps. He was graduated from the Temple university law school at Philadelphia in 1928 and was admitted to the bar that year. After a period in private practice of law, he was elected to the U.S. congress as a Democrat from the 2nd Pennsylvania district, serving from 1937 until his resignation in Nov. 1943 to accept appointment as assistant U.S. attorney general in Washington, D.C. In 1946 he was appointed federal judge for the eastern district of Pennsylvania. After Pres. Harry S. Truman's dismissal of Attorney General J. Howard McGrath on April 3, 1952, McGranery was nominated to succeed McGrath. He was confirmed by the senate May 20 after Republican opposition. On June 10 McGranery began an investigation of the department of justice by ordering all U.S. attorneys under his jurisdiction to report all delays of prosecution and to reveal any time they spent in private law practice.

Machinery, Farm: see AGRICULTURE.

Machinery and Machine Tools. Machine tool building enjoyed good times during 1952 and notable progress was made in developing new machining techniques and in perfecting processes already in existence. The defense tooling programs in the United States and in England greatly stimulated the machine tool industries in those countries and in western Europe, and much of the technical advancement during the year stemmed from attempts to solve manufacturing problems connected with armament items, especially aeroplanes and jet engines.

The U.S. machine tool industry's output rose well over the 1,000,000,000 mark for the year, reaching that level for the first time since 1943. The demand for defense purposes was so great that in February builders were forbidden to ship any machines except to users with defense-rated orders. Those restrictions were relaxed late in the year, when the defense load in the machine tool industry began to lighten. Meanwhile the supply of machine tools available to users in the United States had been enlarged by importation of a sizable volume from England and western Europe. It was estimated that during the complete year about \$50,000,000 worth of foreign machine tools were imported, many going to defense contractors.

During the year the federal government created an advisory committee on production equipment which was headed by Harold Vance, chairman of the Studebaker corporation. It was given the task of studying what should be done to broaden the base of industrial mobilization in readiness for a national emer-

HIGH-SPEED CAMERA manufactured by the Eastman Kodak Co., filming the motions of a machine operator in the firm's plant in 1952. This technique was used to detect wasted motions which could be eliminated by improving the operating designs of machinery, thus saving labour costs

gency and of recommending measures for keeping a healthy machine tool industry at hand for service in time of war. Toward the end of the year the Vance committee came up with the idea that enough new machine tools should be put into defense factories, such as jet-engine plants, to enable a large expansion of production quickly if an emergency should arise. The committee also suggested that enough large machine tools (popularly called the "elephants") should be produced during the following year or two to provide a comfortable supply for reserve purposes. These machines normally take 9 to 18 months to build.

The spectacular recovery of the German machine tool industry came to light at the second European Machine Tool exhibition at Hanover, Ger., in September. German builders had redesigned many of their machines and had gone into competition with United States builders in offering so-called "production" machines and even special-purpose machines, such as the transfer-type machines used by the automobile industry. The Hanover show also revealed notable progress in the design of machines produced by other European builders. More than 5,000 machine tools were displayed by 800 exhibitors from 13 countries. About 500 exhibitors were Germans.

Copying attachments had become standard equipment on European lathes, even on standard models, and they had been extended to milling machines, boring mills and shapers. At least two lathe builders arranged the copying slide and templet holder to be turned through 90 degrees to permit profile facing operations with the same attachment. Electromagnetically operated multidisk clutches, sliding rotor motors and program-switching devices were much in evidence at Hanover. They were used for preset speed and feed selection, automatic rapid approach and return and similar applications on turret and centre lathes, millers, grinders, boring machines and gear cutters.

One German builder came out during the year with sliding rotor motors for braking unit heads of multiway drilling machines, tool heads of a large planer, the automatic chucking mechanism of a production lathe and the electrohydraulic control of a vertical broach. Another German company brought out a pneumatic superfinishing device which reciprocates the stones at a rate of 2,500 strokes per minute by means of air cylinders. It was supplied as an attachment for lathes and grinders, but could be applied to other types of machines. Several European

builders designed vertical or inclined bed profiling lathes. One knee-type vertical miller had a horizontal spindle built into the column for simultaneous face milling. A German company built a hydraulic universal grinder with three spindles, one each for cylindrical, surface and internal work. But European machines, in general, were still underpowered by U.S. standards.

Trying to machine so-called "unmachinable" materials had been one of the foremost problems in the United States. In 1952 a new process—the ultrasonic method—came to light. The process consists of vibrating at high frequency and low amplitude a soft tool having an end shaped to the desired contour against a workpiece, while a mixture of finely divided abrasive and water flows around and under the end of the tool on top of the work. Under light but continuous pressure, the tool sinks into the workpiece, which may be tungsten carbide, titanium carbide, zirconium boride, hardened tool steels, molybdenum, alnico or other metals, as well as nonmetals such as diamond, quartz, aluminum oxide, flint, glass, boron carbide and others. With this process, carbide dies can be solid instead of being made in weak sections conventionally required for complex shapes. Cutting rates vary with the material being worked, the volume of material removed and the power of the machine. For example a $\frac{1}{8}$ -in.-thick carbide drawing die for producing six fluted splines was made in about three minutes with a spline used as the tool. One of the most unusual applications of the process was for producing curved holes.

"Flame plating" was another process developed during the year. By this process, tungsten carbide and other powdered metals could be coated on any metal in thicknesses from 0.0005 in. to 0.020 in. The coating was neither diluted nor alloyed with the base metal. Bond was mechanical, similar to that created by metal spray; and the coating was very ductile, heat resisting and shock resisting, particularly when thin. Its application was limited to areas up to 6 x 40 in. The new process provided top abrasion resistance with such contrasting properties as lightness, flexibility or electrical conductivity. Irregular objects could be coated, providing surfaces could be covered from the horizontal plane to 45 degrees above it.

Abrasive belt taper grinding was a new method of tapering aircraft wing and fuselage skins which was unveiled during 1952. A 36-grit, 126 x 50-in. waterproof cloth belt was used for all heavy rough-grinding tests. Belt speed was 6,200 surface feet per minute. Between 200 and 250 lb. of material was removed before the belt lost its grinding efficiency. Then it was used as a finishing belt, resulting in satisfactory surface finishes.

Two tracer-controlled, right-angle lathes were developed during the year for fast, accurate machining of jet-engine parts. They were equipped with right and left power angular slides and air-gauge tracer units for contouring operations on outside and inside diameters or faces. Five blade surfaces were ground in a single operation on a new grinding machine with 24-in.-diameter wheel which was announced during the year. A new abrasive-belt grinder removed up to $1/32$ in. of stock on jet-engine bucket airfoils in less than eight seconds. This contour grinder employed a 12-ft. belt driven through a nine-speed transmission by a 15-h.p. motor. Both convex and concave surfaces were ground by clamping the work between upper and lower dies that had the required form.

(B. Fv.)

McIntyre, James Francis Aloysius (1886-), U.S. Catholic prelate, was born in New York city on June 25. He attended New York city's public schools, Harlem evening high school and the College of the City of New York. His first job was that of errand boy in the Wall street section of New York city. In the

employ of the H. L. Horton company (1902-15), he rose to the position of office manager, from which he resigned to study for the priesthood. He was a student at Cathedral college and Joseph's seminary (1915-21) and was ordained a priest of the Roman Catholic church on May 21, 1921.

He was an assistant at St. Gabriel's church, New York city (1921-23), and was appointed assistant in the chancery office (1923), chancellor (1934) and a domestic prelate (1936). He served as auxiliary bishop of New York and titular bishop of Cyrene (1946-48) and became archbishop of Los Angeles in 1948. On Nov. 29, in Vatican City, Pope Pius XII named Archbishop McIntyre a cardinal-designate.

McKay, Douglas (1893-), U.S. government official, was born on June 24 at Portland, Ore., and received his bachelor's degree in agriculture at Oregon State college, Corvallis, in 1917. He served overseas as an infantry officer in World War I. He was an automobile salesman in Portland, Ore., from 1920 to 1927, then set up his own automobile dealership at Salem, Ore. Mayor of Salem for one term (1933-34), he was later Oregon state senator for four separate terms (1935-37, 1939-41, 1943-45 and 1947-49). In 1948 he was elected governor of Oregon on the Republican ticket; he was re-elected for a second term in 1950.

Although a staunch opponent of such vast public power developments as the projected Columbia Valley authority and the Missouri Valley authority, McKay became known in the west as a supporter of local governmental development of natural resources. He was named for the post of U.S. secretary of the interior by Dwight D. Eisenhower on Nov. 20, 1952.

Madagascar. The fourth largest island in the world, situated off the southeast coast of Africa, Madagascar is an overseas territory of the French union. The Comoro archipelago is administered as a separate territory. Areas and populations are shown in the table.

	Area (sq.mi.)	Population 1936 est.	1950 est.
Madagascar (with dependencies)	228,589	3,669,328	4,181,800
Comoro archipelago	849	128,608	168,400
Total	229,438	3,797,936	4,350,200

Population: many indigenous racial and tribal groups, the Merina being the most numerous (c. 900,000); 64,429 Europeans (1950), including 44,517 French; Hindu, Chinese and Arab minorities. Language: Malagasy, related to the Malay, Polynesian and Melanesian groups. Religion: Madagascar, Christian and pagan; Comoro archipelago, Moslem. Chief towns (pop., 1950 est.): Antananarivo or Tananarive (cap., 174,153); Majunga (32,163); Tamatave (28,747); Diégo-Suarez (28,865). High commissioner in 1952: Governor General Robert B. B. B. Comoros, administrator: Pierre Coudert.

History.—The moderates polled the most votes in the elections to the provincial assemblies on March 30, 1952; out of 93 seats, only 3 (in the town of Antananarivo) fell to the nationalists. The poll was heavier than in any previous elections. The elections to the senate resulted in no change.

Teaching was made to conform more to metropolitan standards, but the use of the Malagasy language was permitted for those learning to read.

It was decided to begin exploitation of the Sakoa coal deposits, with a target of 100,000 metric tons a year for local use. The plan also envisaged new sugar, sisal and vegetable-oil cultivation in the western plains, where soil conditions were still being investigated. There was a slight increase in the quantity of rice exported (particularly to the Mascarennas) because of the shortage of rice from Asia.

In September and October there was a big exhibition in Tananarivo to demonstrate modern techniques and to outline Madagascar's potentialities.

Education.—(1952) Pupils: primary 236,000; secondary 11,500; technical 4,300; undergoing higher education 200; bursaries in France 135.

Finance and Banking.—Note circulation 7,500,000,000 fr. C. F. A. Monetary unit: franc C. F. A. (Colonies Françaises d'Afrique)=2 metropolitan francs. In 1952 the exchange rate was 350 metropolitan francs to the U.S. \$1.

Foreign Trade.—(1951) Imports 22,400,000,000 fr. C. F. A. (including 1,400,000,000 fr. from the French union and 1,350,000,000 fr. from the British Commonwealth); exports 13,500,000,000 fr. C. F. A. (including 1,000,000,000 fr. to the French union and 1,300,000,000 fr. to the British Commonwealth), mainly coffee (5,300,000,000 fr.), cloves 1,000,000,000 fr., meat (1,000,000,000 fr.), hides (800,000,000 fr.), tobacco 600,000,000 fr.), fibres (700,000,000 fr.), graphite (500,000,000 fr.). (Hu. De.)

Magnesium: see MINERAL AND METAL PRODUCTION AND MINES.

Maine. The extreme northeastern state of the United States, Maine was admitted as the 23rd state in 1820, and is popularly known as the "Pine Tree state." Land area 31,040 sq. mi.; water area 2,175 sq. mi.; population (1950 census) 913,744, an increase of 7.9% over 1940. The population of the principal cities (1950 census) was: Augusta (cap.) 20,913; Portland 14,634; Lewiston 40,974; Bangor 31,558; Auburn 23,134; South Portland 21,866; Biddeford 20,836; Waterville 18,287.

History.—The first year of Maine's 2% sales and use tax brought the state \$11,212,242. The state property tax ended June 30, 1952, but brought in \$5,576,922 in its last year, thus counting for a large portion of the \$9,073,269 excess of revenues over expenditures for the fiscal year 1951-52. The legislative research committee worked on a heavy docket including investigations of the state liquor monopoly, the state Indian tribes and Maine county government, and prepared its reports for the 1953 legislature. Hearings in May and June produced sensational charges of graft and corruption regarding liquor purchases by the state. The "evidence," much of it hearsay, was used by the state attorney general and grand juries in two counties. By mid-October one man had been convicted of conspiracy and the former chairman of the liquor commission acquitted of the same charge.

The June primary and election in September were tinged with the liquor episode at the U.S. senate and gubernatorial levels. Gov. Frederick G. Payne was able to win the U.S. senate seat from incumbent Owen Brewster by defeating him in the June primary. Republican representatives Robert R. Hale (1st dist.), Charles P. Nelson (2nd dist.) and Clifford G. McIntire (3rd dist.) were re-elected.

The chief officers of Maine during 1952 were: governor, Frederick G. Payne; secretary of state, Harold I. Goss; attorney general, Alexander A. LaFleur; treasurer, Frank S. Carpenter; auditor, Fred M. Berry; commissioner of agriculture, Fred J. Nutter. The governor is the only elected state official in Maine.

Education.—The net enrolment in the public schools on April 1, 1951, as 159,269 compared with 158,247 in 1950 and 162,821 in 1949. The state granted \$6,035,207 from the general fund for public education to cities and towns for the year 1951-52, compared with \$5,424,114 in 1950-51. Teaching positions in 1950-51 numbered 6,384, compared with 323 in 1949-50. Expenditure per pupil based on average daily attendance in 1950-51 was \$177.89, compared with \$166.84 the previous year. The commissioner of education, Harland A. Ladd, died during the year, and was succeeded by William O. Bailey.

Social Insurance and Assistance, Public Welfare and Related Programs.—As of Dec. 31, 1952, there was an estimated balance in the Maine employment security fund for unemployment benefits of \$41,700,000, compared with \$39,007,558 a year earlier. Total estimated benefit payments for 1952 were \$5,500,000, compared with payments of \$5,558,694 in 1951 and \$9,125,833 in 1950. The state expended for health, welfare and charities for the fiscal years ending June 30, 1952, and June 30, 1951, \$16,365,808 and \$16,270,261, respectively. The 1952 expenditures in-

cluded \$7,470,267 in old-age assistance and \$3,879,901 for dependent children. Thirteen state institutions (correctional, hospitals for the insane, sanatoria) as of Sept. 30, 1952, had a total inmate population of 5,671 and 1,498 employees, and the totals expended for the fiscal years 1952 and 1951 were \$5,551,045 and \$5,080,811, respectively.

Communications.—Highways of the state in 1952 were: state highway system, 3,167 mi.; state-aid system, 7,922 mi.; local system, 10,765 mi.; total 21,854 mi. In the year ended June 30, 1952, the state expended state and federal funds for highway and bridge purposes, exclusive of debt and interest charges amounting to \$22,049,553, compared with \$21,085,465 for 1951. Total highway expenditures for the same years were \$25,665,878 and \$24,828,883. Steam railway mileage on eight railroads was 1,881 line miles (Dec. 31, 1951). Maine had 34 licensed commercial airports in 1952, and one regularly scheduled air line. There were 15 AM and 2 FM radio stations operating in 1952, and 11 daily newspapers. There were 305,558 motor vehicles registered in 1951, and 311,640 estimated for 1952, with 349,163 operator's licences issued in 1951 and 359,635 estimated for 1952.

Banking and Finance.—During 1952 the Maine banking department supervised 32 savings banks, 31 trust companies and 30 building and loan and savings and loan associations. The following figures are for June 30, 1952: deposits of savings banks, \$252,341,000; total assets, \$291,162,000; trust company deposits, \$259,122,000; total assets, \$284,383,000; building and loan and savings and loan associations, total resources, \$39,351,338. There were 32 national banks in the state with combined assets on June 30, 1952, of \$259,829,000, demand deposits of \$83,113,000 and time deposits of \$149,251,000. Receipts, expenditures and bonded debt of the state government for the year ending June 30, 1952, were, respectively: \$78,571,693; \$69,498,424; \$5,554,500. For the year ending June 30, 1951, they were, respectively: \$64,759,416; \$65,451,912; \$6,973,500.

Agriculture.—Rainfall was subnormal, especially during June and July, with resulting crop damage. The state was designated a "disaster area" by the U.S. department of agriculture, thus qualifying for help from the Farmers Home administration.

Table I.—Principal Crops of Maine

Crop	Indicated 1952	1951	Average 1941-50
Corn, bu.	540,000	540,000	490,000
Oats, bu.	2,349,000	5,016,000	3,243,000

Fisheries.—During 1951 there were 220,922,749 lb. of fish landed at Maine ports, valued at \$15,606,047 to the fishermen. Corresponding figures for 1950 were 353,279,886 lb. and \$14,688,742, respectively. This represents a decrease in quantity of 37%, but an increase of 6% in value. The value of the principal species, with weight in pounds in parentheses, included: lobster, \$7,214,107 (20,759,471); rosefish or ocean perch, \$3,428,816 (73,941,835); clams, \$1,372,803 (5,689,604); herring, \$913,689 (59,738,075). The pack of Maine sardines in 1951 amounted to 1,676,764 standard cases, valued at \$14,635,352 to the packers. This was a decrease of 50% in volume and 31% in value from 1950.

Manufacturing.—The average number of weekly hours worked in manufacturing by production workers (Aug. 1952) was 41.1 and average hourly earnings were \$1.346. The nonagricultural labour force of the state employed in Aug. 1952 was 286,400, which was 3,500 or 1.2% more than a year previous. There were 1,691 manufacturing establishments in Maine in 1951, with production valued at \$1,195,462,216 and 130,095 employees, of whom 38,542 were women. Average annual earnings were \$2,524 in 1951. (E. F. D.)

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Maine in 1949 and 1950, listing all items with value exceeding \$100,000. Data for 1951 were not yet avail-

Table III.—Mineral Production of Maine, 1949–50

Mineral	(Short tons)			
	1950	Value	1949	Value
Cement	1,127,000	\$2,705,000	1,057,000	\$2,526,000
Feldspar	19,000	125,000	20,000	130,000
Sand and gravel	4,897,000	1,726,000	4,605,000	1,394,000
Stone	310,000	2,214,000	259,000	2,026,000
Other Minerals		691,000		666,000
Total		\$7,461,000		\$6,742,000

able. Maine ranks 44th among the states in the value of mineral production, with 0.06% of the U.S. total.

Maize: see CORN.

Makins, Sir Roger Mellor (1904–), British diplomat, was born in London, Feb. 3. He was educated at Winchester and at Christ Church, Oxford, was called to the bar in 1927 and a year later entered the foreign office, subsequently serving in Washington, D.C. (1931–34), and Oslo, Nor. (1934). As an economist he was assistant adviser on League of Nations affairs, foreign office, 1937 (adviser in 1939); adviser to the British delegation, International Labour conference, New York city, 1941; and to the U.K. delegation to the first conference of the Food and Agriculture organization, 1945.

Makins was British minister, Washington, from 1945 to 1947 when he returned to England to become, until 1948, assistant undersecretary of state, foreign office, in charge of the economic and North American political departments. In November he succeeded Sir Oliver Franks as British ambassador in Washington. He was knighted in 1949.

Malan, Daniel François (1874–), South African prime minister, was born at Riebeck West, Cape Province, May 22. He was educated at Victoria college, Stellenbosch, and at the University of Utrecht, Neth., where he obtained the degree of doctor of theology. He returned to South Africa as a minister of the Reformed Church and in 1915 became editor of *Die Burger*, shortly afterward being elected chairman of the newly formed Nationalist party in the Cape. He was elected to the house of assembly in 1917 and during 1924–33 was minister of the interior, health and education.

At the outbreak of World War II Malan supported Gen. James Hertzog's policy of neutrality, and on the general's death in 1942 became leader of the opposition. In the 1948 election the Nationalist party obtained a majority and Malan succeeded J. C. Smuts as prime minister.

His government carried out a policy of *apartheid* (racial segregation) but in 1952 a constitutional crisis arose over a decision of the appeal court in March which invalidated the Separate Representation of Voters act. Maintaining the sovereignty of parliament, his government introduced the High Court of Parliament bill. Speaking in his constituency on Feb. 29, he said that the government's policy was to keep white and white together and black and black together and described the colour problem as the most important in the country. On May 13 he stated that the nontransference of the three British territories to the union had become an acute problem and could not continue indefinitely.

After the high court had revalidated the Voters act in August, and the Cape supreme court had declared the high court's act itself invalid, Malan on Aug. 30 described South Africa as being at the crossroads: "the choice is between life and death of the nation."

Malaria: see TROPICAL DISEASES.

Malaya, Federation of. The Federation of Malaya consists of the British settlements of Malacca and Penang and the protected states of Johor, Kedah, Kelantan, Negri Sembilan, Pahang, Perak, Perlis, Selangor and Trengganu. Area: 50,680 sq.mi. Pop.: (1947 census) 4,908,086, including 2,427,834 Malays, 1,884,534 Chinese (38.4%), 530,638 Indians and Pakistanis; (1951 est.) 5,337,240. Religion: Malays are Moslem; Indians mainly Hindu; Chinese Buddhist, Confucian and Taoist. Chief towns (pop. 1947 census): Kuala Lumpur (federal cap., 175,961); Penang or Georgetown (189,068); Ipoh (80,894); Malacca (54,507); Taiping (41,361). High commissioner in 1952, Gen. Sir Gerald Templer. Commissioner-general for the U.K. in southeast Asia, Malcolm MacDonald.

History.—The struggle against the Communist terrorist forces in the Malayan jungle and villages entered its fifth year in 1952. The sharp rise in the number of casualties inflicted on the terrorists continued. The number killed in 1950 had been 639; in 1951 it was 1,025; and between March and August 1952 it was 648. Casualties among security forces and civilians were fewer. The increasing effectiveness of the campaign against the Communists was mainly the result of the resettlement under police protection of about 500,000 Chinese "squatter" cultivators carried out by the former high commissioner Sir Henry Gurney and by Lieut. Gen. Sir Harold Briggs (director of operations, 1950–51); this had denied sources of supply to the terrorists. Measures taken by the new high commissioner, Gen. Sir Gerald Templer, who took over in February, to improve police training and reorganize intelligence services were a contributory cause. There were 70,000 regular and special constables and about 250,000 home guards operating against the Communists. A special drive was made to recruit more Chinese to the police and home guard. One important step taken by the new high commissioner was the establishment of the Malayan Federation regiment, open to all racial communities. Arrangements were made to add a sixth battalion to the Malay regiment (which was open only to Malays). In July a law was passed making all able-bodied men in Malaya liable for two years' service in the armed forces, the police or civil defense organizations; and the federal legislative council adopted a resolution favouring the early introduction of conscription.

The background to the military and police struggle against Communist terrorism in 1952 was the continuing effort to transform the triracial society of Malaya into a unified nation. In September, after nationality laws had been passed in the nine Malay states, a new federal law was enacted under which 60% of the Chinese and 30% of the Indians in the country automatically became citizens.

The holding of local elections went forward gradually. In February 12 members (out of 18) were elected to the Kuala Lumpur municipal council. The terms of the franchise (still confined to Malayan citizens) disqualified about half the adult population, and out of the 60,000 qualified to vote only 11,600 had registered. But 70% of the registered electors went to the polls after a lively election campaign. In May an ordinance providing for elected village boards was referred to a select committee of the legislative council. It enabled such boards to be constituted both in new Chinese villages in resettlement areas and also in Malay villages. The new boards were to be corporate bodies with power to raise local rates up to limits to be fixed by resident commissioners or prime ministers of states, and their main tasks were to be the establishment and upkeep of schools, playgrounds and community centres, village roads and sanitary works.

Another political development was the formation of the Pan-Malayan Labour party, an amalgamation of existing Labour parties in Singapore, Penang, Malacca and Selangor; by the en-

SIR GERALD TEMPLER, Malayan high commissioner (left), examining responses to an appeal for information on Communist guerrillas in a Malayan town in 1952. Opened in the presence of town witnesses (background), the replies resulted in the arrest of 28 collaborators

of the year it had about 10,000 members. The panracial Independence for Malaya party which had been formed under the chairmanship of Dato Onn in 1951 made only slow progress, after a defeat in the municipal elections at Kuala Lumpur where it secured only 2 seats out of 12, all but 1 of the remainder being won by an electoral alliance between the two communal parties, the United Malays National organization and the Malayan Chinese association.

World economic developments had a serious effect on Malaya's social and economic progress in 1952. The price of rubber, upon which the economy of the country depended, fell during the year, and in June the wages of the 350,000 rubber workers were reduced. In August the Malayan Planting Industries Employers' association announced further cuts of 11% to 14%; these were rejected by the trade union on the grounds that the cost of living to the workers had fallen very little. In October both sides agreed to accept the decision of an arbitration board appointed by the Malayan government. The fall in rubber prices also had serious consequences for the progress of the six-year development plan that had been launched in 1950. Expenditure on the antiterrorist war had in any case priority and in the estimate for 1952 this amounted to about half the total outlay. The yield from the export duty on rubber, Malaya's principal source of revenue, during the first half of 1952 was about Mal. \$20,000,000 less than expected; a budgetary deficit at the end of the year seemed likely. The expansion of housing and the educational and health services was retarded.

The Rural and Industrial Development authority, which had made a slow start in 1951, succeeded in allocating nearly twice as much money in the first half of 1952 as it had expended in the whole of the previous year. (See also SINGAPORE.)

Education.—(1951) Government-maintained and aided schools: Malay 1,704 (285,864 pupils); Chinese 1,171 (206,343 pupils); Indian 881 (37,164 pupils). English-instruction schools: 111,354 pupils. Junior technical schools 4; agricultural colleges 1; teachers' training colleges 2. University of Malaya (1950-51): 850 students.

Finance.—Monetary unit: Malayan dollar, valued at 32.67 cents U.S. in 1952. Budget: (1951 revised est.) revenue Mal. \$733,268,678, expenditure Mal. \$534,474,066; (1952 est.) revenue Mal. \$640,951,250, expenditure Mal. \$660,605,065.

Foreign Trade.—(1951) Imports Mal. \$1,131,000,000, exports Mal. \$1,978,000,000. Main sources of imports: U.K. Mal. \$335,000,000;

Indonesia Mal. \$196,000,000; Thailand Mal. \$187,000,000; Australia Mal. \$51,000,000. Main destinations of exports: U.K. Mal. \$609,000,000; U.S. Mal. \$403,000,000; France Mal. \$155,000,000; Italy Mal. \$90,000,000; Germany Mal. \$79,000,000.

Transport and Communications.—Registered motor vehicles (1951): private 30,750; commercial 9,193. Railways (1951): passenger train miles 1,194,000; passenger journey miles 6,735,000; freight train miles 2,268,000; paying freight ton-miles 243,097,000. Air transport: passengers carried (1951) 186,532. Shipping: ships (75 tons and over) entered and cleared (all federal ports, 1951) 6,729; total tonnage 19,359,176 net registered tons. Telephones (1951): 28,086.

Agriculture.—Main crops (metric tons, 1951): rubber 605,300; rice (1950-51) 702,923; copra 160,042; coconut oil 86,469; copra cake 55,661; tea 3,684,158 lb.; pineapple (canned exports) 16,913. Livestock (1951): buffaloes 228,300; oxen 248,600; goats 251,800; sheep 22,300; pigs 280,200; horses 500. Fisheries (1951): total catch 159,179 tons, value Mal. \$239,825.

Mining.—Production (1951): tin in concentrates 57,167 tons; coal 382,539 tons; iron ore 846,803 tons; gold 17,018 troy oz. (D. A. SN.)

Malenkov, Georgi Maximilianovich (1901-), soviet politician, was born at Orenburg (Chkalov), Russia, Jan. 8. He joined the Communist party in April 1920. After the civil war, he studied at Moscow Higher Technical college and was secretary of the Communist students' organization. In 1925 he was appointed personal secretary to Joseph Stalin. In March 1934, before the purges of 1936-38, Stalin appointed him member of the Orgburo and head of the personnel department. The 18th congress of March 1939 elected him member of the central committee of the All-Union Communist party which, in turn, appointed him one of the five secretaries. On Feb. 21, 1941, he became a substitute member of the Politburo and on June 30, 1941, a member of the State Defense committee. For organizing aircraft production during World War II he was awarded in 1943 the title of Hero of Socialist Labour and the Order of Lenin. On March 19, 1946, he was appointed one of 10 full members of the Politburo and one of 8 (there were 14 by 1952) deputy chairmen of the council of ministers. Besides Stalin, only Malenkov was simultaneously a member of the government and of the three key party bodies: Politburo, Orgburo and secretariat. On Sept. 22-23, 1947, he and A. A. Zhdanov were soviet delegates at the conference in Wilcza Gora, Pol., at which the Cominform was created. At the 19th congress of the Communist Party of the Soviet Union (as it was now called), Malenkov read the main report (Oct. 5, 1952) and was elected member of a commission of 11 to revise the party program (Oct. 13) as well as of the new central committee of 125 (Oct. 14). The

last-named elected him on Oct. 16 to the new key party bodies: a 25-member presidium and a 10-member secretariat.

Malta. This British colony consists of a group of Mediterranean islands about 58 mi. south of Sicily; only Malta and Gozo are important. Area: Malta 94.9 sq.mi.; Gozo 25.9 sq.mi. Pop.: (1948 census) 305,991; (1951 est.) 313,000. Language: Maltese and English; Italian also spoken. Religion: Roman Catholic. Principal towns (pop. 1948): Valletta (cap., 57,156 including suburbs), Sliema (24,294), Hamrun (17,124), Birkirkara (16,070). Governor in 1952, Sir Gerald Creasy; prime minister, G. Borg Olivier.

History.—The year 1952 began inauspiciously with a strike of 10,000 admiralty, war office and air ministry employees during a dispute about an increase in the cost of living bonus. Rioting occurred on March 6, and 29 people, mostly strikers, were injured. The strike ended when a trade union delegation was sent to negotiate with the service departments in London. Activity at Valletta and the movement of military and naval forces increased during the early part of the year because of the disturbed situation in the Suez Canal Zone. Early in June G. Borg Olivier, the prime minister, led a delegation to the colonial office in London which discussed the continuing economic difficulties of the island and sought financial aid. After prolonged negotiations the secretary of state for the colonies announced in the house of commons on Aug. 1 that Olivier had not accepted the assistance offered, which included £500,000 in 1952 and up to £200,000 a year for five years starting in 1953 to assist emigration. Next day Olivier stated that he had, in fact, accepted the offer. (K. G. B.)

Education.—Primary schools (1949–50) 111 (attendance 38,708); state-aided secondary 4 (attendance 587); technical 3 (attendance 353); private elementary and secondary 64 (attendance 15,877); university, 300 students, 65 professors and lecturers.

Finance and Trade.—Currency: sterling. Budget (1951–52): revenue £6,402,045; expenditure £6,856,975. Foreign trade (1951): imports £19,040,000; exports £1,878,000.

Manchuria: see CHINA.

Mandated Pacific Islands: see TRUST TERRITORIES.

Mandates: see TRUST TERRITORIES.

Manganese. There is a long list of minor producers of manganese ore, but the few major producers listed in Table I account for more than 90% of the world total, according to the reports of the U.S. bureau of mines.

United States.—The salient statistics of the manganese

industry in the United States are shown in Table II.

Domestic ore production in the early months of 1952 showed little change from the 1951 level, with 44,300 tons through May, but receipts of foreign ore increased to 1,027,679 tons of general imports and 855,466 tons of imports for consumption. Consumption of ore was 764,416 tons and of ferromanganese 368,057 tons in the five months. (G. A. Ro.)

Manitoba. Central province of Canada, Manitoba was established as a province on July 15, 1870; area 246,512 sq.mi. (26,789 sq.mi. water); pop. (1951 census) 776,541, approximately 60% urban. Capital, Winnipeg, 235,710. Other cities: St. Boniface, 26,342; Brandon, 20,598; Flin Flon, 9,899; Portage la Prairie, 8,511.

History.—The lieutenant governor (representing the crown) in 1952 was Hon. R. F. McWilliams; the premier, Hon. Douglas L. Campbell. In Dec. 1951 Ronald D. Turner and Edmond Prefontaine were appointed provincial treasurer and minister of municipal affairs in the government, respectively. The political issues decided by legislative action during the year were the completion of the Pine falls power site, the awarding of contracts for the development of McArthur falls power site, both on the Winnipeg river, and the purchase of the Winnipeg Electric company power and distribution system by the government's Manitoba hydroelectric board; decision on the routes of the Trans-Canada highway through the province; the franchise to the Indians; provision for women to sit on juries; and the power taken by the government for civil defense operation.

Education.—In 1951 there were 108,625 elementary and 20,243 secondary school pupils in 4,900 classrooms. The University of Manitoba, Winnipeg (state supported), with six colleges affiliated, celebrated its 75th anniversary in Oct. 1952 with an enrolment of 4,652 in all faculties. Total public expenditure on education by the government in 1951–52 was \$7,025,000, with an estimate for 1952–53 of \$7,800,000. The government increased its support for public schools by increasing its guaranteed grant from \$1,600 to \$1,700 per elementary room and to \$750 for secondary-school rooms, and aided in the capital cost of new schools.

Public Health and Welfare.—Mental institutions at Selkirk, Brandon and Portage la Prairie and a psychopathic hospital in Winnipeg had a total registration of 2,902 and total under treatment during the year of 3,759. Under the Manitoba health plan there was an increase from two to three laboratory and X-ray units (diagnostic). Thirteen local health units served a population of 281,546 and there were 31 district hospitals and 30 medical nursing units, 4 each being additions. A federal health survey was completed and it recommended a national voluntary health insurance plan, and of the total of 60 recommendations the priority was for the expansion of the Manitoba health service program. As of March 31, 1951, four provincial jails administered by the attorney general reported 2,635 admitted, with \$291,279 expended upon maintenance. There were 504 cases of poliomyelitis reported in 1952 to Oct. 15.

Communications.—At Dec. 31, 1951, the all-weather road mileage was 9,244. A \$4,000,000 highway construction program was under way in 1952. Trans-Canada highway routes were approved by Manitoba and Canadian governments in 1952, both east and west of Winnipeg. There were 4,837 mi. of railway, exclusive of yard tracks and sidings. There were seven radio stations and two short-wave outlets. Stevenson field, adjacent to Winnipeg, was the air centre for both civilian and military use and training. The government-owned telephone system at the close of 1951 had 155,663 subscriber stations, with 146 exchanges and radio telephonic service to northern Manitoba centres.

Finance.—The estimated revenue for 1952–53 was \$49,588,639 and expenditures were \$49,099,606. The total gross debt at March 31, 1952, was \$158,389,962, of which \$93,777,048 was self-sustaining, with sinking funds held of \$16,072,680. A new five-year tax rental agreement with Canada was expected to produce \$24,725,000 for 1952–53 and a guarantee of \$18,634,954 during its tenure.

Agriculture.—In 1952 wheat, oats, barley and flax reached a record in volume. The 1951 gross production reached a value of \$306,725,000 and an estimated net of \$245,179,000. The Canadian wheat board had not completed payment of deferred and final amounts to farmers for 1951, and these would increase the agricultural values for the year.

Fishing and Fur.—Commercial fishermen numbered 6,578 in 1951–52, catching 35,457,600 lb. valued at \$4,263,187 (market value \$7,664,503), and consisting of pickerel, whitefish, saugers, pike and tullibees. Fur trappers numbered 9,630 in 1951–52, of whom 2,574 operated registered trap lines; the wild catch was valued at \$2,384,745. Furs valued at \$1,936,845 were produced on 516 fur farms.

Manufacturing.—The estimated gross production of 1951 totalled \$596,000,000. Pay rolls approximated \$116,000,000 in about 1,650 establishments employing 44,000 persons. In 1951, 25 new industries were established.

Mineral Production.—Production in 1951 was estimated at \$28,397,000, of which \$21,048,000 represented metals. Of the 62 oil wells drilled in Manitoba during the five-year period, 28 were drilled in the first eight months of 1952. Production was limited by marketing facilities.

(J. L. J.)

Mao Tse-tung (1893–), chairman of the Chinese Communist party and of the Chinese People's Republic, was born in Shao Shan, Hunan province, and educated in Changsha. He helped found the Chinese Communist party in Shanghai in 1921; became political commissar of the 4th Red army in 1931; and in 1934 at the second All-China Soviet congress became the unchallenged leader of the Chinese Communists. He led his forces into northwest China to escape the Chiang Kai-shek "annihilation campaigns" in 1934–35. Between 1937 and 1943 he led his forces against the invading Japanese, but after the Japanese surrender in 1945 supervised the Communist armies that drove Chiang's nationalists back until, by the autumn of 1949, the Communists were strong enough to launch their People's regime. Early in 1951 Mao was quoted by the Indian delegate to the United Nations as threatening an irreconcilable break with the west if the Chinese should be branded aggressors in Korea. After the extended truce negotiations began in Korea, however, Mao was reported in western press dispatches as being the centre of a rift with the U.S.S.R. Subsequent events of 1951 and 1952 did not tend to bear out these reports. An indication of internal unrest in China was given by Mao, however, in a new year's message of Jan. 2, 1952, in which he declared that the Chinese should "launch vigorously and uncompromisingly a large-scale struggle against (domestic) corruption, waste and bureaucracy."

Marine Biology. In most ocean areas where sonic apparatus has been used, a layer of uncertain origin, the "scattering layer," has been observed to reflect and scatter the sound waves. This layer is found closer to the surface at night than during the day, when it frequently descends to more than 1,000 ft. In the North Atlantic several workers have attributed it to swarms of the shrimplike euphausiids. An interesting study by Hilary Moore of the Marine laboratory of the University of Miami, Coral Gables, Fla., developed a relation between the sea temperatures and the distribution of these animals. In an earlier paper, Moore had postulated that the temperatures encountered at the extremes of its vertical diurnal migration were the limiting factors in the geographical distribution of a species. He now considered the effects of temperature in greater detail and arrived at a theoretical relationship with these two temperatures which fit the known distributions very well.

Although diving apparatus had been used for many years to observe the larger marine organisms, it was only in 1952 that a serious effort was made to use such means to study the movements of small planktonic animals. Richard Baimbridge, who had been studying the swimming behaviour of planktonic animals in laboratory apparatus, made a number of descents at Milford Marine station in Scotland to observe copepods. He found that the population occupied two zones: an upper 12 in. where the movement was generally a "hop and sink" one and a deeper one where individuals were found swimming in equal numbers vertically upward or downward. He concluded that the diurnal vertical migrations are a direct and straight swimming up and down and not, as had been suggested by some authors, the result of random movements.

The annual cycles of weekly observations of open ocean plankton were completed at the United Nations Weather Station

CREATURES FOUND at one-mile depths in the Pacific ocean in 1952 by scientists of the Scripps Institution of Oceanography. At top left are two sea devils which have lights to lure prey, and at top right, a gulper with a mouth several times larger than its head

Baker (56° 30' N., 51° 00' W.) in boreoarctic waters between Labrador and Greenland and Station Easy (35° 30' N., 48° 00' W.) in a subtropical area of the Central Atlantic. The zooplankton collections were being analyzed at the University of Rhode Island, Kingston.

For several years depth finders had been used to locate schools of fish, particularly in the North sea, and a new instrument, the "Fischlupe," especially made for this purpose, was released during 1952 by a German firm. A new program was started at the Woods Hole Oceanographic institution to evaluate the echo characteristic of schools of fish in order to tie together fishery biology and modern underwater acoustics. Similar studies, which were being continued during the 1952 season, were reported upon by the Marine laboratory in Aberdeen, Scot. When the sound echos are to be used for some purpose other than detecting fish, the fish-produced reflections are often very troublesome. Experiments conducted at the University of Hawaii, Honolulu, resulted in the discovery of a chemical irritant which completely breaks up schooling patterns of fish within two minutes in dilutions as great as 1 part in 100,000,000.

Underwater sounds of biological origin were being investigated by the University of Rhode Island, where records were made of the sound produced by 27 species of North Atlantic coastal fish and 26 species from Bermuda waters. The analysis included frequency range and the principal frequency components. Particular attention was also given to the mechanisms involved in the character of the sound and the significance of its production.

The use of underwater photography was extended at the Woods Hole Oceanographic institution by the successful photography of a two-mile strip of the sea scallop bed on the Nantucket shoals at a depth of 150 ft.

The Scottish Marine association announced the receipt of a grant from the Development fund of the British government for the development of underwater television for biological observation. The association had already published a recognizable figure of an euphausiid shrimp taken with a prototype of the apparatus.

At the University of Hawaii two species of tuna were for the first time penned and subjected to experimental procedures. The behaviour of these fish toward various chemicals indicated that chemical attraction might be well within the practicality of use on schools in the open ocean.

The blue-fin tuna was studied at the University of Miami in

co-operation with other Atlantic coast organizations. Plane spotting and serological studies were used in addition to the more conventional methods. It was suggested that these tuna originate in the Caribbean.

Experimental fishing cruises were conducted by the Woods Hole Oceanographic institution off the coast of New England beyond the usual range of the commercial fisheries in depths between 150 and 550 fathoms. Many lobsters were taken not only from relatively shallow water but also from depths where they had never before been reported. William Schroeder, in charge of the operation, came to the preliminary conclusion that these may occupy deep water at all times and that the inshore populations may originate in part from the deeper grounds. Schroeder estimated that about 5,000 lb. of lobsters might be taken with a trawl within several days of fishing. Large quantities of redfish (sold as "ocean perch" after filleting) were obtained southeast of Halifax, N.S., and it was believed that they also represented a population separate from those in shallower water.

The University of Miami was experimenting with the use of electric currents to drive shrimp and fish out of rough ground into areas accessible to the trawling apparatus used by the commercial fishermen.

A study of the quahog or hard clam (*Venus mercenaria* L.) conducted at the Woods Hole Oceanographic institution showed that clam farming would not be profitable in the open sand flats because of the action of predators. While the attempt was abandoned, a great deal was learned about the biology of the principal predators, the boring snail and the horseshoe crab. The possibility of growing clams in artificial ponds in salt marshes was being investigated. Growth studies of these clams were being carried out in Narragansett bay by the University of Rhode Island. The Woods Hole Oceanographic institution also investigated the causes of the failure of the blue point oysters in one of the large bays on the south shore of Long Island and found the cause to be pollution from the numerous duck farms on the tributaries to the bay. The results were so interesting to those working with the more general problems of pollution that the study in the area was to be continued even though the original task had been completed.

Although shipworms every year damage piles and other wooden structures having in sum an enormous replacement value, it had never been certain whether they actually digest the wood or merely cut it away to make a burrow to lie in. Investigations at the Marine laboratory of the University of Miami showed that shipworms definitely digest the wood, an important piece of information in planning how to poison the boring organisms. (See also OCEANOGRAPHY; ZOOLOGY.) (J. C. AG.)

Marine Corps, U.S. During 1952 the status of the United States marine corps was restated and confirmed by the passage of public law 416, which set the minimum strength of the corps at three divisions and three aircraft wings. This law, an amendment to the National Security act of 1947, provides that the commandant has co-equal status with members of the joint chiefs of staff on all matters directly concerning the corps.

In Jan. 1952 the 3rd marine brigade, which was organized the previous summer, was redesignated the 3rd marine division and the 3rd marine aircraft wing was recommissioned at Cherry Point, N.C. The division was located at Camp Pendleton, Calif., and the wing was based at Miami, Fla.

The strength of the corps at the beginning of the year was about 217,000, and at the end of the year was more than 230,000.

Basically specialists in amphibious operations, marines continued to participate in manoeuvres throughout the world. In

"Mainbrace," a NATO (North Atlantic Treaty organization) naval exercise, 2,000 marines made a landing in Denmark. The Nevada atomic bomb tests in May allowed marines from every major unit within the corps to gain practical experience in atomic warfare.

The fostering of "Vertical Envelopment," or the landing of shock troops by helicopter, continued to be a prime project of marines in the U.S. and in Korea. Speed, flexibility and surprise, available through the utilization of helicopters, are essential in carrying out one of the primary functions of the corps—that of providing fleet marine forces of combined arms, for service with the fleet in the seizure or defense of advanced naval bases and for the conduct of such land operations as may be essential to the prosecution of a naval campaign.

The 1st marine division and the 1st marine aircraft wing continued to play a major role in the Korean conflict. The 1st division, as a part of the 8th army, served on the eastern front during early 1952, but was moved to the extreme western front during the summer. Most of the squadrons of the 1st marine aircraft wing remained under the operational control of the 5th air force, while others operated from aircraft carriers of naval forces, far east.

The United States marine corps is a separate service within the department of the navy. It was headed in 1952 by Gen. Lemuel C. Shepherd, Jr., who took office on Jan. 1 of that year for a four-year term as commandant of the marine corps.

(L. C. SD.)

Marriage and Divorce. Generally, marriage and divorce rates declined throughout the world during 1952, continuing the trend discernible during the last half of 1951. Birth rates in many countries were near the high levels that had prevailed since 1946. In a report issued by the United Nations there were tabulated about 50 different types of aid provided by 19 nations to defray costs of bringing up a family or to encourage large families.

United States.—With a marriage licence rate of only 9.6 per 1,000 population based upon the first six months of the year, a total of 1,450,000 marriages was estimated for 1952, a decrease of 9% from the preliminary total of 1,594,900 marriages for 1951, which represented a loss of 6% from the revised total of 1,667,200 marriages for 1950. Median ages for marriage in 1951 were 22.6 years for men and 20.4 for women. It was believed that births during the year might approach the 3,833,000 registered in 1951, since the total births for the first half of 1952 were estimated at 1,852,000, a birth rate of 24 per 1,000 population. Including annulments, the number of divorces was not expected to exceed 375,000—a possible increase of 1% above the 371,000 divorces granted in 1951 but a decrease of nearly 3% from the 385,100 divorces of 1950. In comparison with the record divorce peak of 1946, the rate of 2.4 divorces per 1,000 population in 1951 was about 44% lower.

From studies and surveys during 1951, there were reports that more married women and fewer single women were taking jobs outside the home than was true during the peak years of World War II. Babies born to college graduates of 1942, according to the Population Reference bureau, Washington, D.C., were sufficiently numerous to replace their parents (average for men 1.51, for women 1.23, babies). In 1950, according to the bureau of the census, there were 966 males to each 1,000 females in the population, with males outnumbering females in 16 states. The University of Chicago began full operation of its Family Study centre and the Yale university medical school established a marriage counselling service.

Great Britain.—In England and Wales a study disclosed that the mean ages of men and women at marriage were 29.5 and

6.5 years, respectively, in 1952 with more men marrying at age 23 and more women at age 21 than any other years. The estimated marriage rate of 8 per 1,000 population indicated a slight decline from the rates of 8.1 for 1951 and 8.2 for 1950. Of 11,000,000 married couples, about 300,000 had solved the housing problem with trailers. It was believed that the divorce rate would be approximately one-half that of 1947 when about 60,190 divorces were granted (*see* Table). The total number of births probably would not exceed 725,000. The Catholic Marriage Advisory Council opened new counselling centres at Birmingham, Bristol and Liverpool. The National Marriage Guidance Council held its sixth annual conference at Bournemouth May 22-25.

In Northern Ireland, where the marriage rate had decreased more than one-half since 1852, by royal assent on Dec. 20, 1951, the minimum ages at marriage of 14 years for boys and 12 years for girls were raised to 16 years for both. The Belfast Marriage Guidance Council, organized in 1947, reported continuing growth.

Canada.—A more liberal plan of old-age pensions (\$40 per month), for persons 70 years old and older who had lived in Canada for more than 20 years, became effective for about 1,000,000 citizens on Jan. 1, 1952. It was believed that marriage and divorce rates continued the slight decline experienced in 1951. In Quebec there was considerable pressure not only to raise the legal minimum age of marriage (12 years for girls and 14 years for boys) but also to give wives the right to own property, to have legal authority over their children and to be entitled to legal separation on the same grounds as husbands.

Other Countries.—In Czechoslovakia the government was utilizing coercive measures to increase the number of wives working in industry. Since 1950 the National (Lutheran) Church of Finland had given regular courses in marriage; in Helsinki alone nearly one-third of all engaged couples attended the courses. The Finnish Population association, through its eight clinics, offered advice and assistance in problems of subfertility, contraception and sexual maladjustment. In France the marriage and divorce rates showed a slight decline; the birth rate reflected little change although measures were taken to outlaw the sale of contraceptives and to repress abortions. The divorce rate in west Germany for 1951-52 was estimated to be about 7% lower than the rate for 1950 (1.6 per 1,000 population);

JUDGE ANNA KROSS (seated left) hearing a case at the informal home term court of New York city in 1952. Goals of the still experimental court were to keep families together by using social work methods and the authority of the court, avoiding formal court action wherever possible

16 counselling centres had been established by the German Conference for Youths and Marriage-Counselling. The Federal German government at Bonn stated that there were about 3,200,000 women, or 13% of the female population, who had been divorced or legally separated, compared with 1,900,000 in 1939.

In a public opinion poll conducted in northern Italy by the Instituto Doxa, 52% of those polled said that it was very important that timely sex education be given to both boys and girls; only 6% regarded such education as harmful. Up to Jan. 1, 1952, there were 6,454 marriages of United States citizens in Japan to Japanese women, of whom 3,240 already had been admitted to the United States. In general, marriage and divorce rates in Japan declined. Under the Eugenic Protection law, 11,403 sterilizations had been performed by 1950. Because of the widespread use of contraceptives and an increase in abortions, Japan's birth rate dropped to 25.6 per 1,000 population. From Norway came the report that 90% of women were expected to marry, with 50% of them marrying before the age of 25 years; the birth rate continued to decline.

In India, with marriage of girls under the age of 14 years legally prohibited, child marriage had virtually disappeared; the prime minister, Jawaharlal Nehru, urged wider use of sterilization, and the World Health organization, assisted by the Indian government, campaigned to popularize contraception. In Mexico, through a new clinic directed by Alfonso Seguro Albitier, eugenic marriage counselling was made available to workers in the ministry of health and welfare. A survey in Palestine of Arab women disclosed that 25% of Moslems and 12% of Christians were marrying before the age of 15 years. In Egypt the Fetwa committee of the University of Al-Azhar, Cairo, ruled that Moslem women throughout the world are not entitled to vote or to hold public office but that they have equal "private authority" with men in such matters as the guardianship of minors and administration of property. From Australia came an estimate that one in every ten marriages ended in divorce, a

Marshall, Caroline and Mariana Islands.

The Marshall, Caroline and Mariana Islands, stretching from about 1° to 20° N. lat. and from 130° to 170° E. long., constitute, with the exception of Guam (*q.v.*) in the Marianas, the Trust Territory of the Pacific Islands. The territory contains about 2,130 islands in 96 distinct island units of which 64 are inhabited, with a combined land area of about 687 sq.mi. Truk, in the centre of the territory, is 4,931 mi. W. of San Francisco, Calif., and 1,832 mi. E. of Yokohama, Jap. The population on June 30, 1952, totalled 57,205. Three-fifths of the population live on the six principal island units: Saipan, the Palaus, Yap, Truk, Ponape and Majuro. The majority of the population is Christian.

History.—The territory, over which the U.S. received a trusteeship from the United Nations in 1947, was under the administration of the U.S. navy until July 1, 1951, when control was transferred by presidential order to the department of the interior. Elbert D. Thomas, former senator from Utah, became the first high commissioner on Jan. 8, 1951, with headquarters at Honolulu, T.H. The territory is divided for administrative purposes into six administrative districts: Saipan, Palau, Truk, Ponape, Yap and Marshall Islands. Each of the districts, except Truk and Saipan, has its own native congress acting as an advisory body to the district civil administration. There are 117 municipalities in the territory; municipal officers, who are natives, are elected by the people in 86 municipalities, are hereditary officials in 19, and are appointed in 12.

A new contract was concluded in April 1952 between the high commissioner and the Phosphate Mining company of Tokyo to continue the shipment of phosphate to Japan.

Education.—On June 30, 1952, there were 146 public schools, of which 139 were elementary, 6 were intermediate, and 1 was the Pacific Islands Central school at Truk, which is an advanced, technical and normal school. These schools had 329 teachers, of whom all but 28 were native instructors, and 7,061 pupils. There were also 20 mission schools with 84 teachers and 1,695 pupils. Instruction is in English except in the first three grades where the native dialect is used. Educational expenditures were estimated at 8% of total expenditures during fiscal year 1952.

Finance.—During the fiscal year ended June 30, 1952, local revenues totalled \$602,242, and U.S. appropriated funds totalled \$4,511,509. Expenditures totalled \$5,062,639.

Production and Trade.—Phosphate production in the year ended June 30, 1952, totalled 102,290 long tons. In the fiscal year ended June 30, 1951, the value of exports totalled \$1,750,162, of which copra represented \$1,100,000 and phosphate rock \$500,000. Other exports included handicrafts, shells, fruits and vegetables, and sponges. Imports were valued at \$1,848,885; the most important imports were food, \$1,123,576; clothing, \$295,906; and tobacco, \$113,040. The U.S. and Japan were the major sources and destinations of the territory's imports and exports.

Marshall Plan: see MUTUAL SECURITY PROGRAM.

Martin, Archer John Porter (1910—), British biochemist, was born in London, March 1. He was awarded the Nobel prize for chemistry jointly with Richard Laurence Millington Synge (*q.v.*) on Nov. 6, 1952, for his share in the evolution of their method of identifying and separating chemical elements by chromato-

graphic analysis. Martin was educated at Bedford school and at Peterhouse, Cambridge. He and Synge worked together on chemical research at Cambridge and from 1941 to 1943 at the Wool Industries Research association's laboratories at Leeds Yorkshire; Martin had come to the Leeds laboratories in Oct. 1938 and went on working there until 1946. In Oct. 1948 he went to the National Institute for Medical Research, London where he became head of the physical chemistry division.

Martin, Joseph William, Jr. (1884—), U.S. congressman, was born on Nov. 3 in North Attleboro, Mass. He worked as a newspaper reporter and later bought the *Evening Chronicle* of North Attleboro, also becoming publisher of the *Franklin Sentinel* (Mass.). He served in the Massachusetts state legislature from 1912 to 1917. In 1924 he was elected to the federal house of representatives and was re-elected consistently thereafter, being named house minority leader in 1939 and speaker of the house in 1947. He was a delegate to the Republican national convention at Chicago, Ill., in 1916 and at Cleveland, O., in 1936; chairman of the Republican national committee, July 1940 to November 1942; and permanent chairman of the Republican national convention in 1940, 1944, 1948 and 1952.

Martinique. This island, situated in the Lesser Antilles, is a French overseas *département*. Area: 427 sq.mi. Pop.: (1946 census) 261,595; (1951 est.) 276,000; mainly coloured (Negro or mixed). Language: a French patois. Religion: Roman Catholic. Capital: Fort-de-France (pop. 1946, 66,006). Prefect: Christian Laigret.

History.—Claudius Petit, French minister of reconstruction, visited the Antilles in 1952 and studied the problems of town development. Fort-de-France airport was completed: it was in the international class and had a runway of 1,700 m. An air service between Martinique and Guadeloupe was established with three flights a week. Sheds for storing bananas were built at the harbour. The road system was further extended. Reafforestation of the mahogany woods was begun.

Education.—All children of school age have primary education; there is one *lycée* and an Institute of Political, Legal and Economic Studies.

Foreign Trade.—Imports (1951): 10,910,000,000 fr. (incl. 9,500,000,000 fr. from the French union). Exports (1951): 7,500,000,000 fr. (almost all to the French union), mainly sugar (2,577,000,000 fr.), rum (2,075,000,000 fr.), bananas (2,281,000,000 fr.). The currency is the metropolitan franc. In 1952, U.S. \$1=350 fr.

Transport and Communications.—Ships entered (1951): 664.

(Hu. DE.)

Maryland. One of the original states of the United States, long known as the "Old Line State," and, in later years, as the "Free State," Maryland is bounded on the north by Pennsylvania and Delaware, on the east by Delaware and the Atlantic ocean and on the south and west by Virginia and West Virginia. The total area is 10,577 sq.mi., of which 696 sq.mi. are water. Pop. (estimated as of July 1, 1952) 2,460,397. Urban population in 1950 was 69% of the total. Annapolis (pop. 1950, 10,047) is the capital. Other cities in the state, with 1950 population figures, are Baltimore (949,708), Cumberland (37,679), Hagerstown (36,260), Frederick (18,142) and Salisbury (15,141).

History.—The general assembly, at its 1952 session, proposed a constitutional amendment to revise the state budgetary system, in order that budgets could be presented on a "performance" or "program" basis. Other companion statutes were enacted to assure that the fiscal program, including capital improvements and all other parts of the fiscal program, would be presented to the legislature at one time.

The lower house of the general assembly in 1952 began the use of an electric voting system.

The principal state officers in 1952 were as follows: governor, Theodore R. McKeldin (Rep.); comptroller, J. Millard Tawes (Dem.); attorney general, Hall Hammond (Dem.).

Education.—In 1951-52 there were 815 public elementary and occupational schools in the state (including Baltimore), with a total enrolment of 249,103 and a teaching staff of 7,415. There were 219 secondary and vocational schools, with an enrolment of 132,689 and a teaching staff of 5,916. In the elementary schools, approximately 2 students in 9 were Negro and in the higher schools, approximately 2 in 11 were Negro. The enrolment in Catholic schools for the state was 60,961 white and 2,578 Negro students. The enrolment in non-Catholic private schools was 13,711 white and 173 Negro students. Thomas G. Pullen, Jr., was state superintendent of schools.

Social Insurance and Assistance, Public Welfare and Related Programs.—As of June 30, 1952, old-age assistance was being given to 11,276 persons, with a total cost of \$5,532,513 for the fiscal year ended June 30, 1952; public assistance was being given to 461 needy blind persons, with a total cost of \$261,085 for the fiscal year; aid to dependent children was being given to 4,989 families, with a total cost of \$5,282,029 for the fiscal year; and 2,692 persons were receiving aid to the permanently disabled, with a total cost of \$1,399,403 for the fiscal year. Unemployment compensation benefits paid for the benefit year ending March 31, 1952, were \$9,175,424.

As of June 30, 1952, there were 1,611 white inmates and 2,654 Negro inmates, or a total of 4,265 inmates, in the four state penal institutions; of these, 37 were white females and 147 were Negro females.

Communications.—The state roads commission expended \$56,521,208.05 for the fiscal year ended June 30, 1952. The total road mileage in the state highway system, as of Jan. 1, 1952, was 4,736.26, in the county system 12,177.24 and in the municipalities 1,204.74. As of Dec. 31, 1951, there were 1,275 line miles and 2,740 track miles of steam railroads and 45 line miles and 60 track miles of electric interurban railways. As of June 30, 1952, there were 731,366 telephone instruments in service in the state, of which 325,656 were in Baltimore.

Banking and Finance.—As of June 30, 1952, state banks and trust companies had deposits of \$1,048,806,837.64 and total resources of \$1,141,166,849.33; mutual savings banks had deposits of \$417,282,042.55 and total resources of \$469,593,062.32. There were 59 national banks in the state with deposits of \$755,338,000 and total resources of \$814,167,000. The total resources of all state and national banks were \$2,425,526,711.65. As of Dec. 31, 1950, savings and loan and building and loan associations were computed to have assets of \$475,842,437.

State appropriations for the year ended June 30, 1952, were \$170,213,293.52 and expenditures were \$162,504,634.39. State appropriations for the year ending June 30, 1953, were \$176,576,899. The total bonded indebtedness of the state as of June 30, 1952, was \$91,531,000, and there was a general surplus of \$15,481,041.91.

Agriculture.—Maryland farmers received an estimated \$86,654,000 from the marketing of principal farm crops during the year 1951, compared with \$76,261,000 in 1950. Cash receipts from livestock and livestock products amounted to \$188,911,000 in 1951, compared with \$160,975,000 in 1950. Total cash receipts from farm marketings amounted to \$275,155,000 in 1951, compared with \$237,236,000 in 1950.

Manufacturing.—The Maryland employment security board estimated the number of manufacturing establishments as of June 30, 1952, to be 2,267 employing 243,716 persons, compared with 254,201 as of June 30, 1951, and the nonmanufacturing establishments (covered by unemployment compensation) at 37,129 employing 375,081 persons, compared with 59,211 as of June 30, 1951. The total pay roll for the three months ended June 30, 1952, was manufacturing, \$222,636,205; nonmanufacturing \$259,263,909, making the total quarterly pay rolls for the 13-week period \$481,900,114 compared with \$449,227,882 for the similar period of 1951. The amount of unemployment compensation benefits paid during

April, May and June 1952 was \$3,137,216.

(C. N. E.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Maryland in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Maryland ranks 37th among the states in value of mineral output, with .19% of the U.S. total.

Masonic Fraternity: see SOCIETIES AND ASSOCIATIONS, U.S.: Freemasonry.

Massachusetts. A north Atlantic state of the U.S., Massachusetts was admitted to the union on Feb. 6, 1788. It is popularly known as the "Bay state." Area: 8,257 sq.mi., including 350 sq.mi. of water; population (U.S. census 1950) 4,690,514, of which 84.4% was urban. The capital is Boston (pop. 801,444); other important cities are Worcester (203,486); Springfield (162,399); Cambridge (120,740); Fall River (111,963); New Bedford (109,189); Somerville (102,351); Lynn (99,738); Lowell (97,249); Quincy (83,835); Newton (81,994); Lawrence (80,536).

History.—The Massachusetts legislature, or the general court, as it is called, holds its sessions annually. The 159th session adjourned on July 5, 1952. Outstanding among the appropriations during the session was authorization for a bond issue of \$200,000,000 to pay for the construction of a toll highway from Boston to the New York state line, linking this with the cross-state highway which New York was building from New York city to Buffalo. Another \$200,000,000 bond issue was authorized for highway purposes. An appropriation of \$35,000,000 was made for capital outlay covering the cost of the construction of new buildings.

The grand total of appropriations for the fiscal year was \$277,729,903.61, an increase of \$15,394,877.95 over the previous year.

The total number of acts enacted during the year amounted to 633; resolves numbered 107. The Little Hoover Recess commission recommended and secured a reorganization of the state department of health and the department of public welfare. The youth service board for the care, treatment and training of juvenile delinquents was also organized. The new law required the full-time services of all three members of the board, and specified that one of them must be a woman. A new housing authority law provided for the creation in every city and town in the commonwealth, except Boston, of a corporate civic body to be known as the "Redevelopment authority." The purpose of this law was to improve substandard or decadent areas, and to provide housing projects for families of low income in rural areas as well as in the cities and large towns.

Several very generous amendments were made to the pension laws, mostly in favour of members of the legislature or past members of it. After adjournment, the Taxpayers' association and the newspapers discovered that these special pension benefits were extraordinary. In the case of a former governor, the pension would amount to a payment to him of \$12,000 a year. On his death the payment would continue for the lifetime of his widow, if any. Responding to the public clamour the governor then called a special session of the legislature on Sept. 9 for the particular purpose of repealing all the legislators' pension bills from 1947 to date, and also repealing travel allowances for members of the legislature and employees of the legislature. The laws in question were repealed and the special session was adjourned on Sept. 15.

State officials for the biennium 1951-52 were: governor, Paul A. Dever; lieutenant governor, Charles F. Jeff Sullivan; secretary of state, Edward J. Cronin; treasurer, John E. Hurley; attorney general, Francis E. Kelley; auditor, Thomas J. Buckley.

Education.—In 1952, there were 1,688 public elementary schools with 429,851 pupils; 111 junior high schools with 82,564 pupils; 225 senior high schools with 125,025 pupils. The public schools of the state em-

ployed a total of 25,937 full time teachers, principals and supervisors whose average salary for the year was \$3,773. The total expenditure of the public schools for support and outlay was \$170,382,221. John Desmond, Jr., was the state commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—During 1952 old-age assistance was extended to an average monthly number of 100,735 persons at an annual cost of \$83,528,078; an average monthly number of 13,100 families received assistance for the care of 31,254 dependent children at an annual expenditure of \$18,407,312; general relief was extended to an average monthly number of 17,699 persons at an annual cost of \$12,801,173.

For the year ending July 1, 1952, the commonwealth appropriated \$6,274,099.21 to maintain correctional institutions, including the state prison (611 inmates), prison colony (795 inmates), reformatory for men (701 inmates), reformatory for women (248 inmates, including babies under two years of age) and the state farm (1,935 inmates, including the criminally insane).

Banking and Finance.—Revenue receipts of the commonwealth for the year ending June 30, 1952, were \$386,513,744.73, including the sale of bonds of \$86,645,000. Expenditures for state government amounted to \$357,464,211.90. The direct gross debt was \$208,613,800, less a sinking fund of \$6,017,140.15 for a net debt of \$202,596,659.85.

The assessed valuation of the state as of Jan. 1, 1951, was \$7,517,636,132. The estimated valuation as of Jan. 1, 1952, was \$7,713,665,812.

As of June 30, 1952, bank deposits in savings banks amounted to \$3,526,353,700; total assets of commercial departments of trust companies, \$1,239,001,000; bank deposits of savings departments of trust companies \$253,061,000; total assets of credit unions, \$86,012,883 and total assets of co-operative banks, \$699,447,649.

Agriculture.—Preliminary figures of cash receipts from the marketing of farm products in 1951 totalled \$210,881,000. This included total crop cash receipts of \$57,953,000 and total livestock products of \$152,928,000.

Manufacturing.—In 1951 there were 2,033 labour unions in Massachusetts. The total membership as of Jan. 15, 1951, was 605,220 (437,543 males and 167,675 females), an increase of 38,831 members over 1950 (D. A. Dy.)

Table II.—Estimated Value of Principal Products Manufactured in Massachusetts

Products	Estimated Value, 1952
Electrical machinery, apparatus and supplies	\$500,000,000
Woollen and worsted goods	490,000,000
Boots and shoes, other than rubber	390,000,000
Clothing, men's and women's, including work clothing	360,000,000
Cotton goods	235,000,000
Leather: tanned, curried and finished	225,000,000
Foundry and machine-shop products	270,000,000
Printing and publishing, book and job and newspapers	180,000,000
Rubber goods, including rubber tires and inner tubes	220,000,000
Bread and other bakery products	200,000,000
Paper and wood pulp	142,000,000
Boot and shoe, cut stock and findings	120,000,000
All other industries	3,900,000,000
Total value	\$7,232,000,000

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Massachusetts in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Massachusetts ranks 40th among the states in value of mineral output, with .13% of the U.S. total.

DRAMATIZING the death of demands for a wage increase for firemen in Chelsea, Mass., in 1952. Firemen invited the town's mayor and aldermen to a banquet at the station and then introduced their "corpse" in protest.

JOE PAYRAIS

SEPT 10 1951 - FEB. 26 1952

Massey, Vincent (1887-), governor general of Canada, was born in Toronto, Ont., on Feb. 20 and was educated at St. Andrew's college, Toronto, the University of Toronto and Balliol college, Oxford. He was president of the Massey-Harris farm implement company, Toronto, 1921-25. In 1925 he was appointed minister without portfolio in the Mackenzie King cabinet, but was defeated in the federal election of 1925. In 1926 he became Canada's first minister to the United States and served until 1930. He was high commissioner for Canada in the United Kingdom 1935-46. He returned to Canada, and in 1949 was appointed chairman of a royal commission to investigate national development in the arts, letters and sciences, presenting his report to parliament in 1951. On Feb. 28, 1952, he was installed as Canada's first Canadian-born governor general. He published *Good Neighbourhood, and Other Addresses in the United States* (1930), *The Sword of Lionheart and Other Wartime Speeches* (1942) and *On Being Canadian* (1948). (C. Cy.)

Materials Policy Commission. On Jan. 22, 1951, Pres. Harry S. Truman constituted the President's Materials Policy commission, under the chairmanship of William S. Paley, and in his letter of instructions directed the commission to make "an objective inquiry into all major aspects of the problem of assuring an adequate supply of (production) materials" for the United States' long-range needs. Specific attention was to be given to the "needs and resources of the nations with which the United States is co-operating closely on military security and economic matters."

The five-man commission including, besides Paley, George R. Brown, Arthur H. Bunker, Edward S. Mason and Eric Hodgins, selected the decade of the 1970s, with 1975 as a typical year in that decade, and made estimates of the nation's and the free world's requirements as of that date. It gauged the consistency and adequacy of private and government practices, policies and programs to supply those needs.

In its report, *Resources for Freedom*, transmitted to the president on June 23, 1952, the commission described their assignment as an "undertaking of staggering proportions." and listed some of the areas that had to be studied: a survey of a multitude of individual materials and the resources for them; a consideration of the productive forces of technology and energy and the obstacles that tend to hold them back; the special materials problems of security; the relationship of private investors to the governments of resource countries; the effects of markets on production—the scores of political and economic forces that bear upon materials in domestic and world trade. It presented its five-volume report "only as a beginning," and stated that the task of analysis, and of meeting materials needs, must be carried on co-operatively by government and private citizens day by day and year by year.

Findings.—The report summarized the United States materials position in these words: "consumption of almost all materials is expanding at compound rates and . . . pressing harder and harder against resources which, whatever else they may be doing, are not similarly expanding."

These facts were cited: Between the outbreak of World War I and the present time the United States consumed more of most metals and mineral fuels than had been used by all the world in all history. With only 9.5% of the population of the free world, the United States was using more than half of the materials produced. With only 8% of the land area of the free world, it was using its reserves much more rapidly than all the rest combined: 8% of its known petroleum reserves were used in 1950 compared with 3.2% of reserves elsewhere in the free world; 6% of its lead, compared with 4.4% elsewhere; 5.9%

THE U.S. OUTGROWS its resource base. Production and consumption of materials other than food and gold in 1935-39 dollars (Source: President's Materials Policy Commission)

of its iron ore compared with 0.18% elsewhere.

As a result of these pressures and circumstances, the United States had crossed the great industrial divide. It formerly produced more than it consumed; by 1952 it was consuming more than it produced. In 1900 the United States exported a net surplus equal to 15% by value of what it consumed; in 1950, it had to import a net of 9% to supply its deficit. To meet expanded needs for 1975, the United States would want to import 20% of a greatly increased consumption. Compared with 1950 imports of \$900,000,000 in terms of pre-World War II dollars, the country would want imports worth \$3,000,000,000 in 1975.

These estimates were based on the calculation that the total national production of goods and services in the United States (the gross national product) would double again between 1950 and 1975, as it had every 25 years during the preceding century, and attain a level of \$556,000,000,000 in 1950 dollars. This calculation was based on estimated growth of population to 193,000,000 by 1975 (bureau of the census figure), a work force of 82,000,000 working a week 15% shorter than in 1952 but increasing its productivity at a rate of 2.5% per year compared with the recent 2.1%. Increased population and increased average income would both increase demand.

Requirements for materials would not, however, increase at the same rate. In 1900 each dollar of raw materials cost supported \$4.20 worth of finished goods and services; in 1950, the raw materials dollar supported \$7.80 worth after discounting for changes in the general price level. On the basis of this trend, a doubling of the national level of production would require a 50% to 60% increase in the supply of materials. This would mean a rise from the 2,700,000,000 tons used in 1950 to about 4,000,000,000 tons in 1974.

Estimates of demand for groups of materials were necessarily rougher than for the total economy and, within the groups, calculations for individual materials were even more difficult. They had to be based on assumptions—for example, that price relationships among materials would remain unchanged—that obviously would not hold good, but which did provide target estimates that helped the commission to assess problem areas.

On this basis, the commission found that demand for minerals would increase 90%, with wide variations among minerals—iron ore, copper, lead, zinc, 40% to 50%, aluminum more than 300%, magnesium 1,700% to 1,900%; demand for timber products, 10%; agricultural products, 40%; water for industry, more than 100%; energy (total, all forms), nearly 100%, electricity alone, 260%.

Estimates for other nations of the free world were not made in detail, but the commission projected economic growth for the free world outside the United States at about the same rate, or a little faster, than that of the United States, with some less-developed countries expanding their economies more rapidly, some industrial nations at a lesser rate.

The key problem for the United States, as the commission saw it, was not that the country might run out of materials, but rather that it faced the "threat of having to devote constantly increasing effort to win each pound of materials, or unit of energy, from resources which are dwindling both in quantity and quality." A rise in the "real cost" of materials—defined as the labour-hours and capital invested per unit of material and energy produced—could cut the potential size of total production, slow expansion and make the rising standard of living falter by diverting productive energies that otherwise would produce output of higher value. Such a development could slow or reverse the trend that had contributed heavily to prosperity and the rising standard of living in the past—the steady reduction in man-hours per unit of output.

Recommendations.—To meet soaring demand, and to do this in a way that would encourage rather than impede economic growth, the commission recommended three courses of action for industry and government: (1) getting more materials and more energy from domestic resources by attacking the technological, physical and economic barriers that presently limit supply; (2) making better use of materials by more efficient design and processes and by using abundant substitute materials for scarce ones; and (3) helping to increase production in other countries and importing more materials on terms beneficial to both producers and consumers. The commission made more than 70 specific recommendations and proposed basic policy to carry

out these three courses of action.

To "renew the renewable resources"—timber products, agricultural products, industrial water—the commission laid its chief emphasis on improving technology and providing incentives, credit and services for putting technology to work. For timber, federal support of state regulations of cutting practices was emphasized, with federal regulation to come later if state action failed. For agriculture, the need for individual farm management plans and for flexible credit was stressed, as was the importance of a price structure responsive to changes in demand for specific materials. The commission saw the industrial water problem as requiring wide river-basin co-operation, with emphasis on using water to produce the highest economic return and on eliminating pollution.

To increase mineral resources, the commission emphasized exploration and greater efficiency in recovery, extraction and use of minerals, coupled with increased recycling of scrap. A census of minerals should be taken every five years, geological mapping should be stepped up (only 11% of the United States and Alaska so far had been mapped), research increased on new techniques to find hidden ore bodies (believed as massive as those already found) and on all aspects of materials handling. The commission recommended incentives: continuation of tax depletion allowances, more liberal tax allowances for minerals exploration, financial assistance to small mining companies. It proposed reform of mining laws and leasing of public lands to permit large-scale exploration. Pointing to the need for greater efficiency in use, the commission cited that only 65% of a tree finds a useful end in industry, that 50% of coal and more than 50% of oil was left underground. In urging that technology seek not only synthetic substitutes, but also ways to substitute abundant materials for scarce, the commission stated that only about one-third of the 90-odd elements entered strongly into industrial use.

In the energy field, the commission urged more study on extracting oil from shale and research on recovering, transporting and utilizing coal as the one fuel available when other supplies fail. The commission cited the need to develop remaining economic hydroelectric resources, called attention to the Columbia, Niagara and St. Lawrence projects and, in connection with the latter, pointed out that the seaway project also would provide relatively safe transportation in wartime for Canadian and Labrador iron ore. The commission emphasized that private enterprise would do most of the job of supplying necessary energy and called attention to the need for looking at the energy supply as a whole rather than as a group of separate sources. It estimated that in perhaps 50% of all use it was possible to change from one energy source to another. Atomic energy and solar energy were cited as the hope of the more distant future and research in these areas was urged.

The commission saw rapid progress in technology as an essential, with increased supplies of energy, to achieving material advances in all areas. It called sharp attention to the shortage of technically trained people and to the fact that there was no central place where research and technology could be pulled together and gaps in industrial and government programs pointed out. It stated that there was no substitute for a "broad frontal attack" by technology on the materials problem as a whole.

As tasks for technology, the commission listed: (1) to foster new techniques of discovery of hidden ore bodies, estimated to contain as much material as already had been found; (2) to bring into the stream of use materials which so far evade our efforts; (3) to apply the principle of recycling and re-using materials more and more broadly; (4) to learn how to deal with low concentrations of useful materials; (5) to

lessen and eliminate the need for scarce materials by substituting ones that exist in great abundance; (6) to develop and use more economically the resources that are renewable in nature.

The commission placed heavy emphasis on the need for increased imports of many materials and for developing foreign resources for free world use. The fact that industrial nations need more materials, and that many underdeveloped free nations have them to export and could use the proceeds to enlarge their economies and raise their living standards, was termed a prospect "dazzling in its promise."

The commission pointed out, in underlining the United States requirements for materials, that it is completely self-sufficient in only two metals—molybdenum and magnesium—and that, of nearly 100 materials used by industry, the United States supplies its own needs for one-third, produces part and imports part of another third, and imports almost all of the remaining third. It was beginning to import high-grade iron ore and recently became a net importer of petroleum.

The commission saw the need for the United States to face up to its changed materials position in its political and economic thinking and to reject a policy of self-sufficiency as no more than a "self-imposed blockade." In essence, the reason was that self-sufficiency would cost too much; that use of imports which had a lower real cost than domestic production would contribute to general economic growth and, hence, increase military strength which depends on it. The commission recommended reducing and eliminating "obsolete" tariffs on materials heavily imported and urged repeal of the "Buy American" acts.

To open foreign sources of raw materials in less-developed, resource-rich countries—the Americas, Africa, south and southeast Asia and the middle east—the commission saw the need for a new "economic statesmanship" among private investors and, on the part of resource nations, a recognition of the mutual benefits of development and hence a balanced, fair and stable treatment of investors. The commission recommended: (1) government agreements with resource countries to protect investments; (2) tax revisions to encourage investment abroad; (3) study and co-operative experimentation with methods to limit world materials market instability. To promote foreign production when military security demands it, the commission recommended long-term purchase contracts and price guarantees to resource nations and, in some cases, management contracts negotiated by the government.

Reviewing other security aspects of materials, the commission recommended that an adequately financed stock pile be made a permanent policy; that offshore oil lands be opened to slow development and oil withdrawals elsewhere be regulated to provide a quickly expandable supply if war should come; that extra facilities and transportation be provided; that techniques for using low-grade domestic materials such as aluminum clays and producing oil from shale or coal be developed; that military designers seek economies in materials use. In summary, the commission believed that the lowest cost method—with full consideration for security of supply—would serve best in this area as for the whole economy.

The commission's final recommendation was that the work of analysis, trouble-spotting and formulation of corrective policy be carried on continuously, year by year, since the details and the nature of the materials problem would change dynamically. This task was recommended to industry, private study groups and to the government.

Method.—The commission began its work of fact-finding and analysis by organizing a central staff of 100 or more persons, drawn from industry, universities and government. The staff, headed by Philip H. Coombs as executive director, with Norvell

W. Page as editor, Max Isenberg as general counsel and William C. Ackerman as executive secretary, was divided into divisions to match areas of study. An economic analysis of the staff group projected estimated future economic needs and materials supplies by studying the past and present role of materials in the national economy. Other groups sought out the significant facts about domestic resources, foreign resources, energy resources, the potential of technology and the problems of security and market policy. A legal staff made a detailed scrutiny of laws bearing on materials, and a statistical services staff amassed tables and estimates on growth of populations, production, trade and investment rates, tariffs and other duties, tax rates and price movements. A commodity panel undertook a series of studies on a score or more of specific materials. Many of the studies were placed among experts in industry, in government and international agencies and in universities to provide a rich background of fact and analysis for the commission's operations.

As facts and figures, data and analysis, began to flow to the commission, authorities and representatives of organizations in many materials fields gave their critical review of analyses and met with the commission in a series of conferences to discuss and seek solutions for the materials problems which began to loom as studies progressed. These clarifying sessions brought a wide range of experience and intelligence to bear upon such major matters as increased discovery and production of minerals and metals from domestic resources; long-run problems in procurement and expansion of foreign production; the potentials of technology in meeting materials needs; the outlook for forest products; and the future challenge to domestic energy resources. (See also BUILDING AND CONSTRUCTION INDUSTRY.)

(1952). (W. S. P.)

Mathematics. Events of historic importance in the international field during 1952 included the holding of the first general assembly of the International Mathematical union in Rome, It., on March 6-8. The expenses of four of the five delegates from the United States were paid by the National Science foundation, marking the first action of the foundation of this character. The U.S. delegates were made representatives of the U.S. department of state. At the assembly, Marshall H. Stone of The University of Chicago was elected by the union as its first president.

The National Science foundation began to function effectively during the year and supported mathematics principally in two ways. The division of scientific personnel and education made more than 50 awards of predoctoral fellowships and eight awards of postdoctoral fellowships in mathematics. These awards took the place of those previously made by the U.S. Atomic Energy commission. A small number of grants for research was made by the division of mathematical, physical and engineering sciences. Since the support of research in pure mathematics was being gradually dropped by the U.S. office of naval research, it was hoped that more substantial support from the foundation would be possible in the future.

The division of mathematics of the National Research council, which was set up early in 1951, continued to operate effectively. The first problem of the division was to provide more mathematical manpower. A step in that direction was the con-

struction by the executive secretary, J. A. Clarkson (following a start which had been made by J. R. Kline, his predecessor), of a roster of more than 200 mathematicians experienced in or qualified for work for national defense or for industry.

A second step toward alleviating the shortage of well-trained mathematicians was the appointment by Chairman H. Marston Morse of a committee on the regional development of mathematics with G. B. Price of the University of Kansas, Lawrence, as its chairman. While the United States had several great centres of mathematical research there were geographical regions with no centres. As a result, many talented young men had never discovered that it was even possible to become a research mathematician, and were lost to the science. The committee was to investigate the possibility of creating new centres, and it would first attempt to discover what could be done to strengthen a small number of departments of mathematics which themselves had already made strenuous attempts to create mathematical centres.

Morse also appointed a new committee on training and research in applied mathematics under the chairmanship of A. Taub of the University of Illinois, Urbana. The National Academy of Sciences subsequently negotiated a contract with the National Science foundation which provided for foundation financial support of this committee, and the work of the committee was also sponsored by the office of naval research, the office of ordnance research and the office of air research. The office of naval research was to provide the full-time services of F. J. Weyl for six months. He was to act as investigator and was to list the existing applied mathematics projects, explore the needs in this field for the national defense, industry and other sciences and report on training and teaching in applied mathematics. The committee was to hold one or more conferences at which invited speakers would present statements as to actual and optimum training programs and methods for applied mathematics of the future. The report of the committee was expected to be of great value both to the supporting agencies and to the many universities which were interested in beginning programs of training in applied mathematics.

On July 1, 1952, Morse was succeeded as chairman of the division of mathematics of the National Research council by A. Adrian Albert of The University of Chicago. The latter appointed Donald C. Spencer of Princeton university as vice-chairman of the division. J. A. Clarkson of Tufts college, Medford, Mass., was to continue to serve as executive secretary.

The problem of publishing the results of mathematical research in a time of soaring costs continued to be a vexing one. The overcrowding of mathematical research journals had been reduced somewhat by the establishment of the *Pacific Journal of Mathematics*, which was in its second year. The most urgent problem was that of obtaining stable support for the publication of *Mathematical Reviews*, an abstract journal valuable as an aid to research. (See also STANDARDS, NATIONAL BUREAU OF.)

(A. A. AT.)

Mauriac, François (1885–), French man of letters, was born at Bordeaux, Oct. 11. He was brought up in the Bordelais and the Landes and finished his education in Paris. In Paris he frequented Catholic literary circles, as he had done in his province, becoming president of the Cercle Montalembert. His first book of poems, *Les Mains jointes*, appeared in 1909 and his first novel, *L'Enfant chargé de chaînes*, in 1913. It was with his short fifth novel, *Le Baiser au lépreux* (1922), published in *Les Cahiers verts*, that he first made a great name for himself. A continuous stream of work followed, including the novels *Le Fleuve de feu* (1923), *Génitrix* (1923), *Le Désert de l'amour* (Grand Prix du Roman, 1925),

Thérèse Desqueyroux (1927), *Destins* (1928), *Le Nœud de vipères* (1932), *Le Mystère Frontenac* (1933), *Les Anges noirs* (1936), *Les Chemins de la mer* (1939), and *La Pharissienne* (1941); a *Supplément* (1928) to Bossuet's *Traité de la concupiscence*; the play *Asmodée* (1937), performed by the Comédie Française; and religious, controversial and critical essays. Mauriac became president of the Société de Gens de Lettres in 1932 and was elected to a seat in the French academy in 1933. From 1945 he devoted himself mainly to journalism, writing strongly anti-Communist editorials for *Le Figaro*; later work, however, included *Du côté de chez Proust* (1947) and a play, *Passage du Malin* (1947). In Nov. 1952 he was awarded the Nobel prize for literature.

Mauritania: see FRENCH UNION; FRENCH WEST AFRICA.

Mauritius. British colony in the Indian ocean with island dependencies of which the largest are Rodriguez and Diego Garcia. Area: Mauritius 720 sq.mi.; Rodriguez 42 sq.mi. Pop.: (1944 census) Mauritius 419,485 (57% Indo-Mauritian), Rodriguez 11,885, Diego Garcia 501, other dependencies 1,077; total pop. (1951 est.) 500,000. Languages: French and Creole French, Hindi and English. Religion: Indo-Mauritians mainly Hindu; others mainly Roman Catholic. Capital, Port Louis. Governor in 1952, Sir Hilary Blood.

History.—The 1952 sugar crop was excellent, amounting to nearly 500,000 tons, and the secondary crops which were being developed made good headway. There was a steadily increasing production of aloe-fibre, tea and tobacco. Other development projects in progress included improved domestic water supplies, irrigation of new lands and hydroelectric power. A reafforestation scheme was approved during the year and a development commissioner was appointed. There was another outbreak of poliomyelitis in April, but it was less severe than its predecessors.

(K. G. B.)

Education.—Schools (1951): primary 227, pupils 64,410; secondary 45 (including 3 government and 9 grant-aided), pupils 5,480. One teachers' training college. College of agriculture (Oct. 1951): students 30, professors and lecturers 12.

Finance and Trade.—Monetary unit: Mauritius rupee, with a value in 1952 of 21 cents U.S. Budget (1951–52 revised est.): revenue Rs. 78,098,028, expenditure Rs. 70,734,676. Foreign trade (1951; including government and military imports, excluding bullion and specie and trade with dependencies): imports Rs. 203,062,064; exports Rs. 237,005,361. Principal exports: sugar, spirits, fibre. Production (1951): sugar 484,000 metric tons, tobacco 485,688 kg., alcohol from molasses (exports) 8,900,000 l., tea 841,160 lb.

Maybank, Burnet Rhett (1899–), U.S. senator, was born at Charleston, S.C., on March 7. After service with the U.S. navy during World War I, he graduated from the College of Charleston, then entered a cotton export firm. He was an alderman of Charleston, 1927–31, mayor of the city, 1931–38, and governor of South Carolina, 1939–41. He was elected to the U.S. senate on the Democratic ticket in 1941 to fill an unexpired term and was re-elected to the senate in 1942 for the term 1943–49 and in 1948 for the term 1949–55. In Jan. 1949 he was named chairman of the senate banking and currency committee.

In the senate, Maybank ordinarily followed the Democratic party line. He did, however, support the Taft-Hartley law and joined the southern Democrats in blocking civil rights legislation. In Jan. 1950 he introduced a \$2,200,000,000 housing bill for construction of more than 200,000 homes. In 1951 he again parted with the administration when he opposed its attempts to institute price rollbacks. During the national steel strike in 1952, Maybank proposed that all strikes in defense industries be outlawed for 120 days, and that government seizure be permitted

hereafter under certain conditions. This proposal was defeated, 63 to 12.

Meat. The beef supply of the U.S. in 1952 was the largest in five years, and a near record supply was forecast for 1953. U.S. civilians in 1952 consumed 3% more red meat than in 1951. On a per capita basis, consumption was 142 lb. (carcass weight) compared with 137.6 lb. in 1951 and a pre-World War II average of 126.2 lb. Beef increased to 60.4 lb. per person against 56.1 lb. in 1951; veal increased from 6.6 lb. (1951) to 7.0 lb. Lamb and mutton increased to 3.9 lb. from 3.4 lb. in 1951; consumption averaged 6.8 lb. prewar. Pork consumption per capita of 70.7 lb. was slightly below the 1951 level of 71.5 lb. but 26% more than prewar.

Poultry meat production for 1952 was indicated at 5,750,000,000 lb., one-fourth as much as the total for all red meats. Chicken of dressed weight of 29.5 lb. was consumed by the average civilian, 2% more than in 1951 and 65% above prewar. Chickens raised on farms numbered only 617,000,000 head compared with 663,000,000 in 1951 and 20% below the 1941-42 average, but commercial broiler placements during the first nine months of the year were about 4% more than a year earlier. Turkeys were again a record crop and the average per capita consumption was 5.6 lb., 8% more than the previous year and 215% of prewar. Included were about 59,000,000 turkeys, nearly 13% more than in 1951. By late October the government had purchased 13,424,222 lb. of turkey to be delivered during November and December to the school lunch program.

Fish consumption, in fresh, frozen or canned form, was 11.4 lb. per capita, about the same as in 1951 and prewar. Imports of frozen groundfish fillets reached a rate of more than 100,000,000 lb. per year, approximately ten times that of prewar and serving about 45% of the U.S. market. Whale steak was used in considerable amounts.

Prices, though varying with types and grades of meat, trended lower in 1952, particularly in live animal and wholesale form. Three aspects deserve special mention: (1) the firmness of top-grade beef prices, whereas common grades declined significantly, in spite of the fact that 10% to 15% more cattle were fed in the corn belt, being finished to higher grades, than in 1951; (2) the general weakness and abnormal seasonal behaviour of pork prices, even in the face of a 9% reduction in hogs produced; and (3) unprofitable prices as low as 18 cents per lb. for broilers in the early part of the year. The government, to support hog prices, in April and May bought 24,490,000 lb. of pork for donation to the school lunch program. Lean pork ceilings were raised one to eight cents per pound, effective late October. In October ceilings were suspended on yearling sheep and mutton sold at wholesale.

Meat imports were high and exports were low. About 50,000,000 lb. of New Zealand beef was imported, some of it re-exported to the U.S. by the U.K. Imports of canned ham and pork products from western Germany were valued at about \$14,500,000. Meat from Mexico, embargoed since Dec. 1946, was again admitted, beginning in September. Early in the year the above-normal movement of cattle and meat to the U.S. from Canada was interrupted by the rise in the value of the Canadian dollar. Then came the complete embargo upon the discovery of foot-

Table II.—Production of Meats in Principal Producing Countries

(In millions of pounds, carcass meat basis)

Country	Beef and veal			Pork, excl. lard			Mutton and lamb		
	1951	1950	Average 1934-38	1951	1950	Average 1934-38	1951	1950	Average 1934-38

and-mouth disease in Saskatchewan in late February. In March Canada banned meat imports during the disrupted marketing following the quarantine.

World meat production in 1951 in the principal livestock countries was estimated at approximately 73,500,000,000 lb., about 1,000,000,000 lb. more than in 1950 and 8% more than prewar. An increase of 7% in pork more than made up for slight declines in beef and lamb. Leading countries were the U.S. (21,909,000,000 lb.), Argentina (4,955,000,000 lb.), western Germany (4,200,000,000 lb.) and France (4,112,000,000 lb.). The Australian situation was described as threatening a beef famine, because two-thirds of the cattle were in the northern drought area.

Available information on per capita meat consumption in other parts of the world indicated Uruguay, 235 lb.; Australia, 228 lb.; Argentina, 225 lb.; Canada, 129 lb.; Denmark, 112 lb.; the U.K., 88 lb.; Yugoslavia, 86 lb.; France, 85 lb.; and Italy, 31 lb.

Meat exports in international trade in 1951 amounted to 4,059,700,000 lb., compared with 4,115,900,000 lb. in 1950 and 4,550,000,000 lb. prewar.

Prices were rolled back by about 10% on meats in France in mid-1952. The fresh meat ration in the United Kingdom was further reduced in January but increased moderately in July. More surprising was the announcement of one meatless day per week in Argentina. Canada supported domestic beef prices at about 25 cents per pound for "good" steers, Toronto basis. With beef and pork supplies at high levels, prices were expected to continue at support levels. (See also LIVESTOCK; VETERINARY MEDICINE.) (J. K. R.)

Medical Rehabilitation of the Disabled.

Although training programs for professional personnel to work in the field of rehabilitation as well as facilities for direct services to the handicapped increased in 1952, the incidence of new disability in the United States and Great Britain continued to be greater than the volume of rehabilitation services rendered.

The federal office of vocational rehabilitation reported that 67,000 persons in the U.S. were rehabilitated during 1952 through federal-state vocational rehabilitation programs. Added to this was probably an equal number who obtained rehabilitation services through their own resources or those of voluntary agencies. In contrast, however, the Task Force on the Handicapped of the Office of Defense Mobilization reported that there were about 2,000,000 persons in the U.S. who needed rehabilitation services and an additional 250,000 persons who joined their ranks each year as the result of accidents.

The greatest single step that could be taken to increase services in both the United States and Great Britain, authorities reported, was the more rapid development of rehabilitation services in general hospitals. The millions of persons hospitalized during the year in both countries had excellent medical care, but many were discharged with disabilities which would prevent them from returning to productive roles in society. Additional specialized rehabilitation centres with complete programs for the

*Forecast by U.S. Department of Agriculture.

severely disabled were needed, but if the nation were to meet the growing problems of increased chronic disability, rehabilitation would also have to be made a part of the medical care given in all hospitals.

Although it was difficult to estimate the financial saving of comprehensive rehabilitation programs, some indication was given in the experience of Goldwater Memorial hospital in New York city. In 1951 the 100-bed rehabilitation unit of this 1,500-bed hospital discharged 168 patients, some of whom went to other institutions, but 91 of whom returned to their homes. From experience, the hospital estimated that it was fair to assume that each of these patients would have stayed at least one more year in Goldwater and many would have stayed much longer. At current hospital costs, the upkeep of these patients for one additional year would have totalled \$237,000.

Of the 91 patients returning to their homes, 12 were placed in full employment by the hospital's rehabilitation counsellor working with other community agencies. An additional five patients were placed in part-time employment and three were placed in sheltered workshops. The amount listed above was not, of course, a net saving to the city of New York, as the additional cost for physicians, therapists and other personnel for the rehabilitation unit was about \$100,000 for the year. Balanced against this, however, is the fact that these physicians and specialists also provided definitive services for the entire hospital. Substantial savings also accrued from the lowered costs of care for the patients, who, as the result of rehabilitation training to the point of self-care, were transferred to custodial institutions where the cost of care was less than half that of the hospital.

Further evidence that this approach is economically profitable was reported during the year by the experience of Grasslands hospital, Valhalla, N.Y. There a group of 58 patients, for whom the original outlook was continuous, indefinite hospitalization, were given a dynamic rehabilitation program. Although many had been in the hospital for months, some for years, half of the members of the group, at the end of the study, were walking without help and two-thirds had been discharged to their homes. Most significant was that two-thirds of the patients required fewer than 60 days of rehabilitation training to make themselves self-sufficient.

Similar results were reported at the Veterans administration's Los Angeles centre in a study of 105 patients, all of whom were physically disabled, many of whom were chronically ill and most of whom had histories of long periods of hospitalization prior to referral for rehabilitation. For various reasons, rehabilitation training was discontinued with 29 of the patients. Of the 76 completing their training, 34 were discharged to their homes and the remaining 42 were transferred to the centre's domiciliary unit, as they were able to walk and were capable of complete self-care.

Hospitals in both nations continued to report during the year that they were unable to expand their rehabilitation services because of the lack of trained personnel. Although the number of physicians receiving specialized training in physical medicine and rehabilitation had increased ten times from 1942 to 1952 in the U.S., the supply still fell far short of meeting the needs. The same situation prevailed in Great Britain, and there was a corresponding shortage of physical therapists, occupational therapists and other members of the rehabilitation team in both nations. (See also VOCATIONAL REHABILITATION, OFFICE OF.)

Covalt, *Physical Rehabilitation for Daily Living* (1952); Joan Simeon Clarke, *Disabled Citizens* (London, 1951); *The Disabled in a Modern World*, Proceedings of the Fifth World Congress of the International Society for the Welfare of Cripples (1952); Office of Defense Mobilization, *Report of Task Force on Handicapped* (1952).

(H. A. Rk.)

Medicine. Early in 1952 an announcement came from the Jewish Hospital for Tuberculosis in Brooklyn, N.Y., that a drug called isonicotinic acid hydrazide, marketed under such names as Rimiofon, Marsalid, Pyrazidin and Nydrasid, had remarkably specific effects in controlling tuberculosis. Following its administration persons with tuberculosis experienced loss of fever, increased appetite and healing of lesions. When the drug was used with streptomycin and with *p*-aminosalicylic acid, called PAS, benefits were more rapid. Reports indicated that good results occurred in some cases of dementia praecox, in overcoming depressive states. (See also TUBERCULOSIS.)

The Schafer method of artificial respiration, widely used throughout the world, was being replaced by the Holger Nielsen arm lift—back pressure technique. The latter was adopted by the American Red Cross, the American Medical association, the American Public Health association and other agencies. In this technique the person is placed face down with the hands resting on top of each other, the forehead resting on the hands with the face turned slightly to one side. The elbows are extended toward the side. The operator kneels on one or both knees in front of the head of the unconscious person. The operator places his hands under the victim's arms above the elbow and rocks backward drawing the arms upward and toward himself. They are elevated until firm resistance is met, then replaced on the floor. The operator then moves his hands to the back just below the shoulder blades and rocks forward, exerting pressure on the back. The operator's thumbs lie close to the spine and the fingers are separated extending backward and toward the side. The operator's arms are kept straight during both the lift and the pressure phases and the complete cycle is repeated about 10 to 12 times a minute. (See also PHYSIOLOGY.)

A substance called hyaluronidase had been known for some time as the "spreading factor" because of its ability to disperse colloids. When injected under the skin or into the muscles with other drugs this activity hastens absorption. Investigators found that this substance, when it gets into the urine, acts to disperse the colloids and this interferes with the formation of kidney stones. Using the X-ray, doctors found that existing stones did not grow larger and new stones did not form after administration of hyaluronidase. Never before had any substance been known which could produce this effect. The only help previously had been surgical removal accompanied by the prevention of infection. Hyaluronidase was also used to break up scar tissue.

The search for new antibiotics continued. Perhaps the most significant announcement of 1952 was the development of erythromycin, also called ilotycin, an antibiotic capable of interfering with the growth of a variety of pathogenic organisms. Other new developments involved substances called pleocidin; mycobacidin, said to be useful against leprosy and tuberculosis; fumagillin, for use against amoebas; and an improved penicillin called bicillin. Outstanding was the widespread use of antibiotics against a variety of diseases and particularly in controlling venereal diseases. The United States formerly had more than 600,000 new cases of syphilis each year. By 1952 the number was down to about 70,000 new cases annually. (See also VENEREAL DISEASES.)

From Egypt came reports of a new treatment in which the patient with vitiligo, a condition in which the skin loses pigment, takes the seeds of a plant called *Ammi maius* Linn. When the white patches are later exposed to the sun, pigmentation occurs. Three active substances had been isolated from the seeds. One, called bergapten, was the substance in bergamot oil which was previously used for this purpose. The other substances, called ammoidin and ammidin, were also effective when taken internally or painted on the spots, after which the unpigmented area

is irradiated by the sun or by ultra-violet rays.

Coeliac disease is a condition affecting babies about the age of one year; they show a sudden disinclination for food and have an increased frequency of action of the bowel. The stools are pale, bulky and offensive in odour. The child loses weight, has abdominal distention and wasting of the buttocks and limbs. Such children are apathetic and morose. Formerly the condition was thought to be the result of inability of the bowel to handle fats, and bananas were used in treatment. New research showed that the fat is not absorbed and that a diet free from wheat and rye results in increased absorption of fat. A high caloric diet can be given with biscuits made from corn flour or soybean flour instead of wheat. B complex vitamins are given simultaneously to prevent deficiency. Under such treatment improvement occurred in almost every case.

Conservative treatment of hypertension or high blood pressure in the past included rest and relaxation, avoidance of physical and mental stress, weight reduction and sedatives. Later medical additions to this treatment included low salt and salt-free diets, accompanied by the use of resins which pick up salt from the bowel. A rice diet, for example, is essentially a salt-free diet. The most effective drug was the recently introduced hexamethonium bromide or hexamethonium tartrate. Another new drug was hydrazino-phthalazine hydrochloride (apresoline).

An important discovery for the possible control of poliomyelitis was the demonstration of the virus in the blood of monkeys. In five out of eight attempts in chimpanzees without apparent disease, virus was isolated from the blood on the fourth to the sixth day after the virus was fed to the animals. In another experiment 12 out of 23 monkeys inoculated by feeding the virus became paralyzed and these had the virus in the blood on the seventh day after feeding. If there is a stage in poliomyelitis when the virus is in the blood before the paralysis begins, the opportunity to destroy the virus before it reaches the nervous system is much greater.

The injection of gamma globulin, in the hope that it would prevent paralysis in children infected with the poliomyelitis virus, was tested in children in cities which experienced severe epidemics. By late 1952 the results had yet to be evaluated. Vaccines against poliomyelitis were also prepared by growing the virus outside the body in tissue cultures and then attenuating it. Such vaccines proved effective in building resistance against infection with poliomyelitis virus, but the method was in the earliest experimental stages. (See also INFANTILE PARALYSIS.)

Much had been learned about an unsolved condition called idiopathic thrombocytopenic purpura, a condition of unknown cause in which purple bruises appear under slight trauma associated with a lowering of the platelets or thrombocytes in the blood. Often there is an associated fragility of the capillary blood vessels. A recently advanced theory suggested that the body develops a substance which acts against the platelets. When platelets are introduced into the blood of patients with this disease their own blood will destroy the new platelets. Some investigators reported dramatic improvement in some cases by giving cortisone or ACTH.

Rene Leriche, a famous French neurosurgeon, treated people paralyzed after brain haemorrhage—apoplexy or a “stroke”—by improving circulation through the brain, the method involving surgical blocking of the stellate ganglion, a nerve centre which controls dilation and constriction of the blood vessels in the torain. The method was first suggested in 1936 and the 1952 report summarized 400 cases. In more than half the cases the method seemed to help in overcoming confusion, loss of speech, pain or loss of motion of the limbs. In some cases blocking of the sympathetic nervous system was said to be more permanently helpful.

LIFE-SAVING DEVICE for premature babies introduced at the Doctors hospital, Seattle, Wash. Known as an air lock resuscitator, it was used to force fluid from the lungs of newborn babies by changing the air pressure in the chamber. The infant shown here weighed 1 lb., 10 oz.

Radioactive iodine was found of increasing usefulness in conditions affecting the thyroid gland. The rate at which the thyroid takes up the radioactive iodine is an indication of its activity. The radioactivity can stop completely the action of the cells so that giving of thyroid extract temporarily may be necessary. The action was reported effective even in cancer of the thyroid and several cases were reported of complete control of cancer of the thyroid by taking radioactive iodine in water. When rats were treated with excessive doses of radioactive iodine, compensatory enlargement of the pituitary gland occurred.

From the universities of Heidelberg and Würzburg came reports of a new blood plasma substitute called subsidon. The product is prepared by the use of an isotonic and isoionic salt solution combined with rutin. The claim was made that rutin prevents unduly rapid escape of blood fluid and inhibits reactions caused by destruction of protein. Experiments indicated that such solutions remained in the circulation for 12 hours whereas ordinary saline solutions disappeared in from 1 to 2 hours after haemorrhagic collapse. A U.S. investigator showed that the virus of infectious hepatitis in pooled plasma is destroyed if the material stands at room temperature for 24 hours after collection.

During the year a report from Great Britain described the use of a new plastic or acrylic lens to take the place of the lens of the eye which had been removed because of cataract. A British eye specialist actually transplanted such an artificial lens into the eye after the operation in more than a score of cases and reported that in many cases the artificial lens healed in successfully.

Chiropractic.—Chiropractic is a science based on the premise that disease results from lack of normal nerve function. The doctor of chiropractic treats, by scientific manipulation and specific adjustment, the structures of the body, especially the spinal column, to restore normal nerve function, thereby enabling the protective and restorative powers of the body to function normally. Physiotherapeutic measures are used as indicated. Nearly 2,000,000 new patients are treated by about 22,000 doctors of chiropractic each year.

The 57th anniversary convention of the National Chiropractic association was held in Miami Beach, Fla., June 22 to 27, 1952. Highlighting the convention agenda was a series of scientific symposia covering important developments in diagnostic procedure, adjusting technique, X-ray interpretation, poliomyelitis, physiotherapeutic practices, obstetrics and public health problems. The American Society of Military Chiropractors held its annual meeting in conjunction with the national convention. The 1953 convention was to be held in Los Angeles, Calif., during July.

Official publications of the National Chiropractic association are *Healthways Magazine*; the *Journal of the National Chiropractic Association*; the *National News*; *Chiropractic—A Career*. Headquarters are located in the National Building, Webster City, Ia. (L. M. R.)

Osteopathy.—A research program both fundamental and clinical in nature, on the further development of the osteopathic concept, was under way during 1952 in each of the colleges of osteopathic medicine. There were six accredited colleges of osteopathy in the United States which admitted students who had 60 semester hours of preosteopathic (premedical) credit as a minimum. Approximately 12,000 osteopathic physicians had

been licensed in the United States, of whom 8,660 were members of the American Osteopathic association. In 1952, 391 osteopathic hospitals were provided by the profession with a total bed capacity of 11,188. The president of the association for 1952-53 was Donald V. Hampton of Cleveland, O. The 57th annual convention of the organization was to be held in July 1953 in Chicago, Ill. (R. P. K.)

Great Britain.—The Medical act, 1950, provided for an "intern year" between qualification and registration. After six months as a house physician and six months as a house surgeon or obstetric house surgeon, certificates of satisfactory service would have to be sent to the appropriate licensing body (university, Conjoint board, etc.). The intern would then be eligible for admission to the full *Medical Register*.

Mr. Justice Danckwerts, as an independent adjudicator appointed by the lord chancellor, resolved on March 25 a dispute between the ministry of health and the general practitioners which had bedevilled the national health service since its inception in 1948. Both parties had accepted the recommendations of the Spens committee on the range of income for general practitioners in the national health service. Spens recommendations were based on the 1939 value of money. What Mr. Justice Danckwerts had to determine was the "betterment factor" to be applied to 1939 values to bring them up to date. After a three-day hearing he applied a betterment factor of 85% for 1948-49 and of 100% for 1950-51. The 100% factor was also accepted by the government for 1951-52. The arrears of pay due to the general practitioners for the four years 1948-52 amounted to about £27,000,000, and most of this was actually paid by the end of November. The Danckwerts award also laid it down that the central pool from which doctors were paid should be adjusted each year by reference to the number of doctors in the national health service and with an allowance of 38.7% for practice expenses—which had an important bearing on income tax liability.

On proposals of a working party composed of representatives of the ministry of health and the British Medical association, it was agreed that a doctor working on his own should have a maximum list of 3,500 instead of 4,000 patients. Partners were to have a maximum of 4,500 instead of 5,000. The number of persons on the list of a permanent assistant was to be 2,000 instead of 2,400. Where there was a shortage of doctors in designated areas, young practitioners who started in practice there would be given an "initial practice allowance" of £600 in the first year, £450 in the second and £200 in the third.

Metallurgy. Research and development in the field of metallurgy were greatly stimulated by the demands of the defense program. Some of the more striking advances in 1952 are described briefly in the following paragraphs.

LOWERING SCRAP METAL into a leaching solution at a pilot plant of the Chemical Construction corporation, Linden, N.J. The plant began operation in 1952, using a new technique for the treatment of ore concentrates by chemical methods instead of the usual smelting and refining techniques to produce pure metals

Continuous Casting.—After only a relatively short time in the development stage, the continuous casting method was put into regular use to cast brass, bronze, steel, copper, aluminum and magnesium in rounds, billets, flat bars, slabs and cakes. The product was sounder and more uniform than with former methods of casting.

Levitation Melting.—Utilizing the magnetic forces generated by high frequency alternating current in two coaxial coils connected in series opposition, a small mass of metal can be suspended in space and melted, either in air, a controlled atmosphere or a vacuum, without being brought into contact with a crucible or other materials that might cause contamination.

Magnetic Alloy.—A new magnetic alloy with a higher coercive force than any other known magnetic material was made by hot pressing a mixture of bismuth and manganese powders in a strong magnetic field.

Substitutes.—Hastelloy X, an alloy of iron, nickel (45%), chromium (22%) and molybdenum (9%), with 0.15% carbon, was being used as a substitute for scarce cobalt in applications requiring resistance to corrosion at high temperatures. The alloy had good forming characteristics and was available in sheet, plate, bars, wire and precision investment castings.

Vapour Deposition.—After 50 years of relative inactivity, the coating of one metal with another by vapour deposition was being revived and extended. The earlier use of direct vaporization and condensation was handicapped by the high temperature required to produce a workable vapour pressure with many metals. The process was simplified and speeded up by bringing a mixture of a volatile metallic compound and a reducing agent into contact with a receiving surface which was heated to a temperature sufficient to cause chemical reaction, thus depositing the liberated metal on the surface to any desired thickness. The temperature of the receiving surface was a critical factor that

was best controlled by induction or resistance heating.

X-Ray Photography.—A new method of X-ray photography took pictures of hot welded sections up to a temperature of 1,200° F. Records could be made at any stage of the welding and any flaws detected could be corrected before completing the weld, thus assuring a perfect weld when finished. (G. A. Ro.)

Meteorology. The search for hidden phenomena in the atmosphere that would account for unexplained changes in weather and climate and show the way to better methods for forecasting these changes has ranged all the way from the sun and other possible extraterrestrial sources to ocean depths and glacial erosion which might reveal the climatic significance of past ice ages. At Princeton, J. G. Charney, J. von Neumann and associates in the Institute for Advanced Study made slow but certain progress in representing some of the features of the general circulation of the atmosphere in mathematical form for treatment by electronics computer (J. G. Charney, "Dynamic Forecasting by Numerical Process," *Compendium of Meteorology*, American Meteorological society). At The University of Chicago a more immediate step to close the gap between theory and practice in weather forecasting was taken when a forecast research group of the department of meteorology was established by H. R. Byers in close working relationship with the district forecast staff of the U.S. weather bureau under Gordon Dunn. Among other subjects that made meteorological headlines in 1952 were rockets and soundings of the high atmosphere, the jet stream near the tropopause, destructive tornadoes, their causes and precursors, and the great October drought in the United States.

Meteors, Rockets and the High Atmosphere.—In an article in the January issue of the *Bulletin of the American Meteorological Society*, Fred Whipple published the most recent results of studies above 30 km. (approximately 100,000 ft.) made principally by means of rockets and observations of meteor trails. New determinations of pressures, densities and temperatures were made up to altitudes of 130 km. and in a few cases much higher. Above 50 km., mean temperatures were found to be much lower than previously computed, the average being 15° to 20° C. (27° to 36° F.) lower at 100 km. Measurements of winds at these altitudes were still too infrequent to yield reliable mean values but wind speeds of 200 m.p.h. or more appeared to be not uncommon. New data were obtained by rocket for values of the solar constant, the ultra-violet and X-ray spectra of the sun and ionization and magnetic phenomena. Direct samples of the composition of the atmosphere at 200,000 ft. gave a greater ratio of helium to nitrogen than previously assumed and also smaller changes in the neon and argon ratios to nitrogen.

These data from the high atmosphere held more than theoretical interest. They had a bearing on the radiation balance and perhaps a greater influence on the heat engine that drives the general circulation and therefore on cyclones and their resulting weather than had so far been discovered.

That the sun provides the energy to drive the general circulation of the atmosphere is unquestioned. Several well-known physicists had tried to derive predictions of rainfall and temperature at the earth's surface from studies of variations in solar radiation but the results remained controversial. Meteorologists usually had looked for the causes of weather changes within the atmosphere itself or in the effects of conditions on the surface of the earth. More recently H. C. Willett was one of a few who re-examined extraterrestrial causes. He suggested that corpuscular emissions from the sun as distinguished from

radiant energy (waves) may account for an increase in the temperature of the high atmosphere at times (*Bulletin of the American Meteorological Society*, vol. 33, no. 6, pp. 255-258). The melting of glaciers during the sunspot maxima of 1917 and 1937 supports this view. It follows that major climatic changes associated with ice ages might depend on variations in the total energy of all kinds received from the sun. Further research was necessary to bring out the facts.

The Jet Stream.—At altitudes below 50,000 ft. the routine radiosonde network gave fairly comprehensive data of pressure, temperature, humidity and wind during 1952 over North America, Europe, Asia and parts of Australia, Africa, South America and the North Atlantic and North Pacific. One of the results was better delineation of the jet stream. This term came into use in meteorology a few years earlier to denote a wind current in the upper air of limited width and flowing at speeds greater than the general circulation. The jet stream is not constant in location, extent or velocity. It usually flows eastward but sometimes it flows toward the north and at other times toward the south. It is not necessarily a continuous circumpolar stream. Usually it is found somewhere between 20,000 and 45,000 ft. above the ground over the zone where the north-south temperature gradient is strongest in the mid-troposphere, that is, in middle latitudes where the tropopause has its steepest slope. Its width may vary from a few miles to 100 mi. or more, and its depth may be only a few hundred feet or several thousand feet. Its average speed is probably less than 75 m.p.h. but it sometimes exceeds 250 m.p.h.

On Oct. 17, 1952, the winds at 39,000 ft. above Argentina, Newfoundland (47° N., 54° W.), were found to be from the west with speeds of about 280 m.p.h. These data by radiosonde were consistent with estimates based on the three-dimensional synoptic analysis. An unconfirmed observation gave a wind speed of about 350 m.p.h. between 35,000 and 40,000 ft. at one time during this period and, although not certain, this wind speed in the jet stream was considered probable under unusual conditions of north-south temperature gradient through the tropopause. The very strong winds aloft over the west Pacific encountered by B-29s during World War II led to discovery of the jet stream and in some of those instances wind speeds of about 300 m.p.h. were indicated. A recent instance in the Pacific was reported by an eastbound aeroplane on Nov. 19, 1952, which found the eastward component of winds at 20,000 to 27,000 ft. to be about 90 m.p.h. for a distance of 4,000 mi. The flight altitudes were below the usual layer for maximum jet-stream speeds and the network of radiosonde observations over the Pacific was too sparse to tell whether the plane was flying close to the axis of the stream or was merely within the general westerlies during a period when they were unusually strong.

Soundings through the jet stream were of increasing practical importance. Forecasters need the measurements each day for use in deriving extended time-period weather forecasts and for research in the relationship between the stream and the origin, development and movement of at least some of the cyclones and anticyclones that bring the daily changes in weather. No less important was the need for jet stream soundings for high-level aeroplane flight planning. Commercial jet-powered air transports were already operating at jet-stream altitudes, and ignorance of its extreme velocities would mean not only uneconomical operation but might also lead to disastrous forced landings. These flight-planning problems brought sharp comments of dissatisfaction from aviators and led to numerous studies and seminars among meteorologists during 1952, notably in England, Canada and the United States. The subject was thoroughly aired in the July issue of the *Quarterly Journal of the Royal Meteorological Society* (pp. 426-457).

In the southern hemisphere the number of radiosonde stations and their geographical distribution were too sparse to comprise even an elementary network, and knowledge of the jet stream there was consequently largely theoretical. In a study published in the August issue of the *Journal of Meteorology* (American Meteorological Society), W. J. Gibbs concluded that the jet stream in the southern hemisphere resembles its counterpart in the northern hemisphere during the respective winters but probably differs considerably in summer. The huge land masses in the northern hemisphere cause irregularities in the north-south temperature gradient and therefore variations in the jet stream with longitude which apparently are not found in the southern hemisphere where the continental masses are small compared with the oceans. The southern hemisphere may also have a secondary jet stream not usually found in the northern hemisphere. In both hemispheres the boundaries of the stream are typified by marked wind shear in vertical as well as horizontal cross section.

Wind shear was examined to explain previously unexpected turbulence in clear air at high altitudes. Aircraft flying at high levels had occasionally encountered very severe turbulence without any of the usual visible evidences of instability such as clouds sometimes give. This refers to instances when the turbulence is more severe than that found in convective currents on a hot day or that resulting from waves which form on the interface between two different wind currents at successive altitudes, either of which may cause "rough" air without necessarily producing cloudiness. The turbulence attributed to sharp wind shear at the boundaries of the jet stream appears to place dangerous stresses on aeroplane structures, and although too little was known of the subject to justify firm conclusions, the effects were assumed to be the result of violent eddy motion set up by the wind shear through the stream. Here also further research was needed to meet urgent requirements of aeronautics.

Tornado Research.—A stream of accelerated winds, also loosely termed a jet stream, had sometimes been found to be associated with an area of maximum potential instability which gives rise to the strong convection that produces tornadoes. The causative relationships between these phenomena were still not clearly understood.

Table I.—Partial List of Tornadoes Occurring on March 21-22, 1952, in Arkansas, Tennessee and Kentucky*

State and county	No. reported	Date	Approx. hour	Path of tornado		No. of persons injured	Dead
				Width (in yards)	Length (in miles)		
Howard Co., Ark.	1	21	3 P.M.	100	25,000	9	7
Saline Co., Ark.	1	21	4 P.M.	400	15,000	0	0

*Tornadoes struck 28 communities in the lower Mississippi valley during March 21-22, 1952. In some cases two or more towns were struck by the same tornado. Studies indicate that there were at least 15 different tornadoes in this series associated with the frontal system which extended from Oklahoma through Arkansas and along the lower Ohio river valley.

The tornado is the most violent of all storms. North America has more tornadoes than any other continent. In the United States their number averages more than 140 per year. They occur mostly during the spring months and are least frequent in December. In most other parts of the world tornadoes occur infrequently, usually less than one per year for each 25,000 sq.mi. of area.

In March 1952 forecasts of tornadoes were published for the

first time as a regular service to the general public. For many years predictions of destructive local storms sometimes implying tornadoes had been published in official forecasts but authorities had preferred not to forecast tornadoes specifically until their causes were better understood and forecasting methods more certain. During the spring and early summer of 1952 the new tornado-forecasting service achieved fair success. In one instance at White Deer, Tex., on June 6, the forecasts warned residents to take refuge in storm cellars. Heavy loss of life was probably thus averted when the storm struck, completely demolishing 15 homes and seriously damaging 35 others. Of the several hundred inhabitants only 12 were injured, none seriously. Property damage was almost \$1,000,000.

That the methods for predicting tornadoes and severe local squalls were still imperfect was shown by the unexpected occurrence of a storm with winds of 100 m.p.h. or more at Carswell field, Tex., near Fort Worth, on Sept. 1. Many military aeroplanes (B-36s) were badly damaged or destroyed and numerous buildings demolished, the losses being estimated at more than \$25,000,000. A group of experienced military forecasters had been giving full attention to safeguarding air force bases by attempting to foresee all severe squalls and tornadoes but the official findings of the board which investigated the disaster concluded that the place of occurrence of such local storms was still largely unpredictable. Nevertheless there was reason to expect better results in short-term warnings from local networks based on radar or eye observations, a system described in a following paragraph under *Radar Meteorology*.

*These columns show the total number of tornadoes reported during the 36-year period.
†These columns show the total number of days on which one or more tornadoes were reported during the 36-year period.

[Arizona, California, Connecticut, Delaware, Idaho, Maine, Massachusetts, Nevada, New Hampshire, Oregon, Rhode Island, Utah, Vermont and the state of Washington reported less than 20 tornadoes during the entire 36-year period. In four mountainous states where the population is sparse in some regions, the records of tornadoes appear to be somewhat unreliable, and ordinary wind squalls may have been mistaken for tornadoes in some cases. The reports may therefore be somewhat too high. These states are Colorado, which reported 54 tornadoes during the 36-year period; Montana, 50; New Mexico, 37; and Wyoming, 57.

A research group at the Johns Hopkins university, Baltimore, Md., worked with the weather bureau in investigating the possibility that a phenomenon called the hydraulic pressure jump might indicate a source of the instability in the air that leads to formation of tornadoes. Under certain conditions an accelerating cold front aloft, or an orographic barrier, may produce a wave on a surface of temperature inversion. If the temperatures and humidities of the overlying air layers are close to certain critical values, the wave may lift superimposed air layers sufficiently to produce the required instability for formation of tornadoes. This hypothesis was tested not only in the laboratory by use of water analogy but also under natural conditions by studies of barograph records during passage of squall lines across a relatively dense network of field observing stations. In several instances where tornadoes occurred the

ABOARD one of the U.S.A.F. weather planes crossing the North pole regularly from Alaska in 1952 to gather data for transmission to the U.S. and elsewhere. The dropsonde unit shown being placed in a chute contained a radio transmitter which sent back data on temperature, humidity and atmospheric pressure

conditions appeared to confirm the hypothesis.

Radar Meteorology.—Another approach to specific warnings of destructive local storms was the radar weather network. For detecting storms characterized by heavy precipitation, as most violent thunderstorms and tornadoes are, radar has the distinct advantages of extending the range of the weather observer's eye to distances many times the normal visual range and penetrating intervening cloud formations which completely obscure the storms from normal vision. The great practical advantage of radar for this purpose is quickly seen by a glance at the problems of maintaining a field network of observing stations sufficiently close together to be sure that all violent local storms are promptly detected and reported. These storms can seldom be seen at distances greater than five miles, often much less if clouds obscure the sky. Meteorological services usually have their network stations spaced at intervals of 50 mi. or more. Closer spacing becomes too costly to maintain universally. Thus the weather observers in a normal network can keep under observation less than 1/25th of the area in which local storms may develop. Under most circumstances modern radar equipment can "see" heavy rain or snow at distances up to 50 or 75 mi., in some cases much farther. With radar stations at intervals of 100 mi. it would be possible to detect most severe

local storms as soon as they form. Populous communities in their paths could be warned of their approach sometimes an hour or more in advance, at other times perhaps only a few minutes, but long enough for the people to seek protection from the violent winds. With this service in view the U.S. weather bureau during 1952 added to its previously established small network of radar stations, which at the close of the year numbered eight. The bureau also utilized radar weather observations from certain military and private radar installations, the total number being about 15. Canada and the British Isles also led in development of radar meteorology.

Other uses were foreseen. In a research paper in the *Quarterly Journal of the Royal Meteorological Society* for July (pp. 372-376), H. Wexler published some of the results of his studies at the University of London under a Fulbright fellowship for investigation of radar meteorology. He found that the so-called upper band sometimes seen by radar may be explained as a reflection from a high collection or layer of graupel preceding depletion of the liquid water content of the cloud below a certain critical value. The bright band which is seen more frequently than the upper band had already been explained as a result of reflections from a layer of melting snow with snow above and rain below. In addition to its value as a research tool in studying the natural processes of rain and snow formation in the atmosphere, radar had been shown to be superior to the conventional rain gauge for measurement of precipitation over any given area within radar range. The rain gauge can provide only spot sampling which is often not representative for the area as a whole. The radar gives an integrated picture that is advantageous in correlation studies in agriculture and other fields.

The third annual Radar Weather conference was held at McGill university in Montreal, Que., on Sept. 15-17 to review recent advances in this branch of the science and to encourage co-ordination of knowledge and plans for further development. Radar offered some hope for solution of some of the most difficult practical problems in obtaining comprehensive sampling of certain important elements in synoptic meteorology.

Artificial Cloud Nucleation (Rain Making).—Any subject with the economic and social implications that are suggested by the possibilities of artificial methods of increasing rainfall is bound to stimulate experimentation, and 1952 saw many research studies aimed at developing methods of increasing the amount of rain or snow in semiarid regions and many field trials by commercial exploiters. Among the noteworthy experiments were those by E. G. Bowen in Australia, who introduced the use of water drops injected into the bases of shower-type clouds with strong updrafts. Success in starting rain from a cloud that had not reached the point of precipitation was reported in a few cases. Other studies investigated the role of large salt nucleuses over the oceans carried into the atmosphere after evaporation of sea spray, and the relationship of these nucleuses to cloud and shower formation. Except for a few contributions from studies like these there was relatively little added to fundamental knowledge of rain making during the year. Commercial rain makers seemed to have expanded their operations somewhat in Europe and Central America but in the U.S. fewer farmers contracted for rain making than in 1951. Many had been disappointed with results but hundreds still believed they had received more rain than normal as the result of artificial seeding of clouds. In several countries the governments were supporting research to determine the facts. Many popular articles on rain making were published. Among those noteworthy were two in the July issue of *Weather* (Royal Meteorological society, pp. 199-210).

Glaciers and Climatology.—For many years geologists and

meteorologists had studied the slow changes in glaciers and searched the evidence hidden in deposits and terrain left during past glacial epochs for knowledge of climatic cycles. The span of recorded temperatures based on thermometer readings is much too short to shed light on whatever fundamental changes took place to cause the ice ages. The subject is important both for its bearing on future civilizations and for its significance in studies of sunspot cycles and other phenomena that may hold the key to understanding of certain factors in the circulation of the atmosphere. Glaciers in Alaska and Greenland which had been undergoing ablation during recent years were observed to have receded still farther in 1952. The results of studies in Glacier National park, Mont., and in equatorial east Africa gave more indication that some systematic and far-reaching trend in climate may have set in. Its future significance was only conjectural but it was likely to be a fertile subject for investigation by scientists who look upon climatology as a dynamic field rather than a collection of static, statistical data.

One of the aids to research in climatology in the U.S., established during 1952, was the weather records centre at Asheville, N.C. This centre was organized by transferring the facilities of the former machine tabulation unit for weather records processing from New Orleans, La., to Asheville and combining with these several of the former regional weather records centres of the weather bureau.

In different conferences in Europe and North America attention was focused on climatology and its applications in the effort to encourage better use of climatological records which contain knowledge of much value in agriculture, business, engineering and industry, especially in architecture and building construction. Microclimatology, which had proven its worth in agriculture since 1942, was a subject of special attention in military science and air pollution studies during the year.

World Meteorology and the World Meteorological Organization.—It is a primary objective of the World Meteorological organization to promote high standards of weather observing and reporting everywhere and to organize efficient exchange of weather information among all countries. The W.M.O. is one of the specialized agencies of the United Nations. During 1952 several of its constituent bodies held sessions as follows: Regional Association for Europe, Zurich, Switz., May 26-June 7; Commission for Maritime Meteorology, London, Eng., July 14-29; Working Group on Clouds and Hydrometeors, Paris, Fr., July 24-Aug. 6; Executive committee, Geneva, Switz., Sept. 9-30.

Some Weather Anomalies in 1952.—In many parts of western Europe and the British Isles snow fell more frequently and accumulated to greater depths on the ground during January and February than for many years. In a few places in central Europe snowfall was the heaviest in 100 years, principally in Austria where the government mobilized manpower to clear the snow from roads to isolated communities after temporary relief from food shortages had been provided by air transportation. Scotland and Denmark also experienced unusual instances of snow-blocked roads. Temperatures in general in western Europe during these winter months were near normal or slightly below.

In North America by contrast the winter weather during the first two months of the year was milder than usual with less precipitation and with temperatures well above normal east of the Rockies. During January Texas averaged 8° to 10° F. above normal and during February large sections of Iowa, Minnesota, the Dakotas, Manitoba and Saskatchewan averaged 10° to 12° above normal, an unusual abnormality for the month. For the three winter months, December-February, as a whole the tem-

*Rainfall amounts are given in inches.

temperatures in the United States ranged from 6° below normal in Montana to 6° above normal in parts of Texas, Alabama, North Carolina, Maryland and Delaware. About 95% of the country east of the Rockies experienced temperatures above normal for the season. Winter precipitation was fairly close to normal in the United States except in the southern plains states where only 25% to 50% of the usual amounts of rain or snow were received. In Argentina and Australia the prolonged record-breaking droughts which had characterized the weather of late 1951 and early 1952 were relieved to some extent by rains in March and April but water shortages continued to be very acute in many localities, particularly in northern Australia.

During May the weather in the British Isles was exceptionally warm, and in the U.S. also it was warmer than normal except in the northeastern section, the greatest departures being 6° above normal in Arizona and 4° below normal in Vermont. Moderate deficiencies in rainfall set the stage for the severe drought of the summer in large areas of southern and eastern U.S., which culminated in October with acute shortages in the water supply. A striking example of the balance in average monthly temperatures that frequently shows up in the contrasting abnormalities east and west of the Rockies was seen in the summaries for June and October 1952. In June the temperatures east of the Rockies were higher than normal, the greatest departure being 10° in Kansas, while the weather was cooler than usual in the states west of the Rockies, the greatest departure being 6° below normal in central California. During October the conditions were reversed, with the western third of the U.S. warmer than usual and the eastern remainder up to 6° cooler than normal. Precipitation during both months was much below normal in most states, some localities having been completely without

rain in either month.

The Great October Drought in the U.S.—An analysis of the conditions in the atmosphere that cause prolonged dry weather with its devastating effects on agriculture and even on the supply of potable water for cities and towns is important not only as a scientific study but also for its very practical bearing on schemes for drought relief by artificial means. The seeding of clouds with dry ice, silver iodide or water droplets in order to cause coalescence of cloud droplets and precipitation of rain or snow cannot be effective unless there is sufficient moisture in the air to permit condensation. The vast air masses that enter into a widespread drought are so extensive that artificial measures are inevitably puny by comparison. The three-dimensional synoptic conditions that led up to and prolonged the October drought of 1952 were no exception in this respect.

The basic cause of the drought was the absence of the usual supply of warm, moist air from the Gulf of Mexico which provides the water for most of the summer rainfall in eastern and central U.S. The analysis of upper air conditions reveals the main features. At the 700-mb. (about 10,000 ft.) level the Pacific anticyclone was unusually well developed and the western extension of the Atlantic anticyclone was intensified over Georgia. The normal low-pressure trough which on the sea level map for June and July was situated in the Great Plains states was displaced westward to the Pacific coast at the 700-mb. level. As a result the region east of the Rockies experienced a long period of southwesterly winds which brought warm, dry air from Mexico and the southwestern U.S. with an anticyclonic pattern which resulted in subsidence of the air and further reduction in relative humidity. This pattern was separated from a cyclonic circulation over southern Canada at the 700-mb. level by a wide band of abnormally well-developed westerly winds. This synoptic situation meant that cool air masses from Canada did not move southward across the U.S. as frequently as usual during the summer, and thus another element for formation of showers was missing.

In terms of the surface weather map these abnormalities in the circulation patterns aloft were characterized by the relative infrequency of cyclones over the U.S., although there was a more or less normal succession of small anticyclones (highs) along the Canadian-U.S. border. Over Canada, on the other hand, cyclones passed frequently while anticyclones were rather

infrequent. These general characteristics continued with occasional interruptions until autumn when the conditions near the surface of the earth and aloft over most of North America took on a somewhat different pattern of abnormality.

About mid-September the circulation in the layers from 700 mb. to 500 mb. (roughly 10,000 to 20,000 ft.) showed a deep trough over the eastern Pacific, an intense ridge over the Rockies and another well-defined trough over the general axis of the Appalachians. The intense ridge extended from the Yukon valley almost to Arizona with its maximum over British Columbia, where the departure from normal was the greatest for the season in 20 years. The gradient accompanying the ridge

*These temperatures are the highest and lowest ever recorded at the places named during more than 50 years of weather bureau records.

caused dry air from Canada to move rapidly into central and southeastern U.S. and effectively shut out the warm moist air from the Gulf which in combination with cooler air masses from the north would have produced rain. As in June and July there was an unusually well-developed zone of strong westerlies which also contributed to the blocking effect upon the normal moisture-laden winds from the Gulf and Caribbean. Only in Florida, which was east of the trough, did the southerly winds penetrate and there the rainfall was twice the normal amount, in some localities even more.

As in the early summer, the surface weather map during October showed more cyclones and fewer anticyclones than usual in Canada while in the U.S. the abnormalities were the opposite. The principal jet stream aloft was usually found near the Canadian-U.S. border, with cyclones moving eastward near the northern limits of the stream and anticyclones moving south-eastward somewhere south of the southern limits of the stream. These features were clearly revealed in the 700-mb. and 500-mb. upper-level charts.

The severity of the drought was shown by some of the record-breaking statistics. The average rainfall for the entire U.S. during October was only 27% of normal, less than 0.6 in. It was the lowest ever recorded for the country as a whole since records began about 1885. In many of the central plains and southern states precipitation was only 10% of normal, or less, many localities having been without rain for weeks. Salt Lake City, Utah, experienced a 62-day period without rain and for the first time in 80 years had no rain during the month of October. St. Paul, Minn., had only 0.01 in., the driest October in 100 years. Some parts of Louisiana and Mississippi had 45 consecutive days without rain, and at Fort Worth and other places in Texas, the 15-week period ending Nov. 1 had less than 1 in. of rain, a deficiency of 7 in. or more for most of these localities.

In addition to widespread damage to agriculture, the water shortage caused reservoirs and wells to go dry and created a very critical fire hazard in villages and forests. Several national parks were closed to the public, but despite these precautions fires started in many states and many thousands of acres of timber were destroyed. Smoke combined with light fog in southern Louisiana lowered visibility so much as to interrupt road traffic. The dry period ended in most parts of the country during November when circulation patterns returned to normal and general rainfall resulted in amounts ranging from two to five inches or more for most regions.

Abnormal weather of different kinds was reported in western Europe during the last two months of the year. Unusually fierce gales in November and December delayed transatlantic shipping and caused damage in coastal cities. A severe storm on Dec. 16-18 pounded the North sea coasts and the Baltic and caused precipitation which left a blanket of early snow in northern Italy, Switzerland, Germany, the Low Countries and Scandinavia.

During Dec. 5-7 London had a dense and persistent fog which was reported as the worst in a century. It paralyzed traffic on the ground and in the air. A second period of unusually dense fog even for London occurred during the fourth week of December, adding to the handicaps of holiday travellers. (See also DISASTERS; FLOODS AND FLOOD CONTROL.) (F. W. RR.)

Methodist Church. From April 23 to May 7, 1952, the quadrennial general conference, the supreme law- and policy-making body of the Methodist Church, major body of American Methodism, met in San Francisco, Calif. This was followed in June and July by quadrennial conferences of the six jurisdictions. These had the duty of electing, assigning and retiring bishops in the U.S. Six overseas central

conferences, with scheduled meetings in late 1952 and 1953, had similar responsibility for mission lands.

The general conference was composed of 746 delegates, half ministers, half laymen. Because of political conditions in their homelands, 26 were unable to attend. Delegates represented 99 annual conferences in the U.S. and 44 overseas. There were 66 delegates from 25 countries outside the U.S., representing more than 1,000,000 members in mission lands (735,988 full members; 301,214 preparatory members).

Bishops (35 in the United States, 16 overseas, 19 retired) were represented in an initial episcopal message, then presided in turn but without voice or vote.

The 1952 general conference:

Adopted a simple pattern for local church organization: four commissions, auxiliary to the official board, on evangelism, education, missions and finance.

Authorized an interdenominational fund to be raised by apportionments to local churches to provide \$200,000 per year for the National Council of Churches and \$85,000 for the World Council of Churches.

Authorized a Crusade for World Order to start in 1953.

Declared 1953 a year of evangelism, in co-operation with Methodist bodies of the world, coinciding with the 250th anniversary of the birth of Methodism's founder, John Wesley.

Activated a Radio and Film commission with an annual appropriation of \$165,000. Its first major project would be a biographical film on Wesley to be produced in England.

Adopted an annual budget of \$9,660,000 for World Service benevolences. This would not include \$7,000,000 per year raised by the Woman's Society of Christian Service nor \$4,000,000 given for special missionary projects.

Indicated interest in ministerial education by appropriating \$850,000 a year to strengthen the church's ten graduate schools of theology; authorized special askings of \$5,500,000 from church members in support of 125 church-related institutions of higher learning and Wesley foundations at state and private universities.

Extended the right to administer the sacrament to unordained pastors who qualify annually by passing study courses leading to ordination.

Established the right of Negro churches to transfer to white jurisdictions if all parties involved approved.

Requested the 45-year-old Methodist Federation for Social Action (unofficial) to remove the word "Methodist" from its name and to vacate its quarters in the Methodist building in New York city. These factors had caused the public to confuse the federation's statements with official Methodist pronouncements.

Modified the Survey commission report, which had recommended sweeping changes in organizational structure, as follows: (1) Reduced membership on general boards and agencies from 718 to 615. (2) Set up a Co-ordinating council to review possible claims of overlapping of agencies. (3) Created the Board of Social and Economic Relations. (4) Created the Commission on Promotion and Cultivation to correlate production and distribution of promotional and resource literature, and authorized to merge much of this material into a monthly program journal for church workers. (5) Created interboard commissions on the local church, on Christian social relations and on cultivation, promotion and publication.

The Methodist Publishing House in September reported its best year with gross sales of \$15,548,000.

Ministerial recruitment showed an upturn. The number received on trial in 1951 was 1,110, compared with 546 in 1947.

The Methodist Church in Great Britain, meeting for its annual conference in mid-July in Preston, Eng., under the presidency of Rev. Colin A. Roberts, elected Rev. Donald O. Soper president-designate for 1953-54. A London office of the World Methodist council was ordered with Rev. E. Benson Perkins in charge. Rev. Walter J. Noble was made president of the British section of the council, succeeding Rev. Dr. Wilbert F. Howard, deceased. Sunday school enrolment (805,659) showed a gain. Church membership figures (741,596), announced earlier in the year, decreased slightly, the first decline since 1947.

Latest figures available in 1952 for the seven largest branches of U.S. Methodism showed a total of 11,348,174 members in 53,648 churches. (See also CHURCH MEMBERSHIP.) (R. SY.)

Mexico. A federal republic of Middle America lying between the United States on the north and Guatemala and British Honduras on the south, Mexico has an area of 760,373 sq.mi.; population (July 31, 1951): 25,715,350. Capital: Mexico City. Chief cities (July 31, 1951): Federal District, including Mexico City (3,049,367); Guadalajara (379,401); Monterrey (330,012); Puebla (210,533); Mérida (159,405); Torreón

(128,557); San Luis Potosí (126,601); León (122,680); Ciudad Juárez (121,912); Veracruz (113,803); Tampico (97,673); Aguascalientes (93,432); Chihuahua (86,796); Saltillo (69,874); Mexicali (64,701); Morelia (60,650); Pachuca (58,698); Culiacán (49,801); Matamoros (43,830). Language: Spanish, with an estimated 6.29% (1940) speaking Indian tongues only. Religion: predominantly Roman Catholic. President to Dec. 1, 1952, Miguel Alemán; thereafter, Adolfo Ruiz Cortines.

History.—Continued industrial advances, exceptional population growth, and the election of a new president were the outstanding items in Mexico's chronology for 1952.

In the July 6 elections, Adolfo Ruiz Cortines, candidate of the Party of Revolutionary Institutions, or P.R.I., official government party which had controlled Mexico politically for 23 years, was named president by an overwhelming majority. An estimated 5,000,000 voters went to the polls, establishing a new record in Mexican election history. The event was peaceful and relatively unmarred by violence. Ruiz Cortines was the second civilian president elected in 40 years, retiring Pres. Miguel Alemán having been the first.

Despite spirited efforts by left-wing forces, Vicente Lombardo Toledano, Popular party candidate and prominent Communist sympathizer, received but fractional support in the contest. The strongest opposition to the P.R.I. candidate was offered by Gen. Miguel Henríquez Guzmán, candidate and founder of the Federation of Peoples party.

President Alemán broke precedent by refusing to instruct P.R.I. party dependents as to whom they should favour for congressional nomination. Ruiz Cortines, in a pre-election statement, stirred considerable discussion and some opposition by pledging to give Mexican women the vote if he were elected.

Census tabulations released during 1952 showed a marked trend toward urbanization throughout the nation, with the greatest growth evidenced in states bordering the U.S.-Mexican frontier.

An uprising in Oaxaca (city) against a new state tax law left two dead and a score wounded in a week end of disturbances in March. A virtual state of siege existed as angry citizens attempted to bring about the dismissal or resignation of Gov. Manuel Mayoral Heredia. Later, the federal government

appointed Gen. Manuel Cabrera Carrasquedo to replace Governor Heredia.

Early in the year, Pres. Miguel Alemán ordered prices frozen on food, clothing, construction materials, automobiles and other items to halt inflation. With six months of his term remaining, Alemán reported that Mexico had invested 7,000,000,000 pesos in public works during his administration.

Heavy August rains, worst in 17 years, together with population increases, put unprecedented burdens on Mexico City's drainage system. Standing water resulted, causing millions of pesos in damages to downtown and residential structures. The city continued to sink more than a foot a year, creating serious problems in sewage and water distribution. It had sunk one foot and eight inches in 1951, according to Adolfo Orive Alba, head of the nation's irrigation department, who gave as the cause the rapid drying out of spongy volcanic subsoil underlying the capital.

Discussions regarding the "wetback" labour problem continued between the United States and Mexico, as did discussions of provisions of contracts between the two nations governing the importation of "bracero" farm workers from Mexico. By midyear, an air-lift service instituted by U.S. immigration and naturalization service officials was returning an estimated 1,700 "wetbacks" to Mexico each month. Immigration officials said that an estimated 1,000,000 border-jumpers were entering the southwestern states illegally each year, and asserted that the move was necessary to protect the legal importation of temporary Mexican labour under international agreement. The Mexican-U.S. accord on "bracero" labour was renewed for 18 months in June.

Progress in public health was highlighted by advances in polio research; by the announcement of a new and simple test for undulant fever; and by a report that smallpox had virtually ceased to be an epidemic disease in Mexico. Only 25 cases of smallpox were reported in the country in 1951, compared with as many as 1,000 annually as recently as 1949.

Parícutin, the young volcano which broke through a cornfield 200 mi. west of Mexico City in Feb. 1943, died a natural

ADOLFO RUIZ CORTINES (left) leaving the Palace of Fine Arts in Mexico City after his inauguration as president of Mexico on Dec. 1, 1952. With him was the outgoing president, Miguel Alemán

death in 1952, according to geologists.

Workers excavating for a water system in a Mexico City residential area uncovered remains of a Teotihuacán Indian culture, including a small shrine and several buildings. The culture uncovered was regarded as entirely separate from that of the ancient Toltec temples and pyramids north of Mexico City at San Juan Teotihuacán. (See also INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.) (C. D. HE.)

Education.—Education is free, compulsory and secular. In June 1950 an estimated 3,986,428 students were enrolled in 29,036 schools and taught by 90,212 teachers and professors. There were 3,096,537 illiterates as of Sept. 1950 (Mexican government estimate).

Defense.—As of Jan. 1, 1952, there were 59,280 men in the air and ground forces, 3,280 of whom were assigned to the air force. As of the same date, the air force had an estimated 163 planes. On Jan. 1, 1952, the ministry of marine was operating 3 gunboats, 4 frigates, 1 armed transport and 30 coast guard vessels.

Finance.—The monetary unit is the peso of 100 centavos, stabilized in June 1949 at 11.56 cents U.S. currency or 8.65 pesos to the dollar. The federal budget for 1952 totalled \$462,336,000, of which \$113,377,000 was allocated for the public debt, \$80,531,000 for communications, \$49,454,000 for education, \$48,438,000 for hydraulic resources and \$38,002,000 for defense. Provisional federal tax receipts for 1951 totalled \$503,838,100. On Dec. 31, 1951, the funded internal debt totalled \$340,462,400 and the external debt, including the railway debt, \$138,994,200. Estimated national income for 1951 was \$4,855,500,000. On May 31, 1952, the Bank of Mexico had gold and foreign exchange holdings totalling \$187,000,000. Notes in circulation on July 31, 1952, totalled \$349,490,700.

Trade and Communications.—Exports in 1951 totalled 5,446,912,749 pesos (January–June 1952: 2,462,131,751 pesos); imports were 6,773,170,662 pesos (January–June 1952: 3,362,231,182 pesos). Leading exports in 1951 were cotton (20%), lead (10%), coffee (7%), zinc (6%) and petroleum products (5%). Leading imports included vehicles (10%), industrial machinery and apparatus (9%), chemicals (7%), agricultural machinery (4%) and wheat (4%). Principal customers were the U.S. (70%), France (4%), the United Kingdom (3%), Germany (3%) and Belgium (2%); principal suppliers, the U.S. (81%), the United Kingdom (2%), Germany (2%), France (2%) and Canada (2%).

As of Oct. 1951 there were 14,032 mi. of passable roads, 9,260 mi. of which were paved. Motor vehicles in Dec. 1950 included 173,080 automobiles, 18,466 buses and 111,252 trucks. In 1950 all air lines operating in Mexico flew a total of 26,041,104 mi. and carried 1,032,413 passengers. According to *Lloyd's Register of Shipping*, the merchant marine had 61 vessels (100 tons and more) aggregating 167,835 gross tons on June 30, 1951. On Nov. 30, 1951, there were 276,000 telephones. In Dec. 1951 there were 230 standard radio broadcasting stations and in Sept. 1952, 4 television stations.

Agriculture.—Agricultural production estimates in 1951-52 (in metric tons) included maize 3,400,000; wheat 370,000; rice 150,000; oranges 365,000; sugar 757,000; potatoes 122,000; cotton (lint) 282,000; henequen 77,000; cottonseed 425,000; beans 190,000; (1950-51) coffee 64,000; tobacco 35,000; barley 162,000; linseed 53,000; sesame 90,000.

Livestock estimates (1950) showed 13,628,288 cattle, 4,703,809 sheep, 6,893,305 goats, 5,474,747 hogs, 2,937,719 horses, 1,021,446 mules and 2,543,186 donkeys.

Manufacturing.—The total value of industrial production in 1951 was 5,057,274,000 pesos. Leading industries included cotton thread and cloth 985,823,000 pesos, beer 551,346,000 pesos, iron and steel 536,588,000 pesos and rubber goods 467,008,000 pesos. Tourism produced about \$271,600,000 income from 395,600 U.S. tourists.

Mineral Production.—Production in 1951 (excluding petroleum) totalled \$70,314 metric tons valued at \$280,303,140. Most important were lead 225,468 metric tons; zinc 180,064 tons; silver 43,790,723 oz.; copper 67,351 tons; gold 393,420 oz.; antimony 6,825 tons; cadmium 894 tons; iron ore 312,580 tons; manganese 28,524 tons. In 1951, 77,238,248 bbl. of crude petroleum and 1,471,300 bbl. of natural gasoline were produced. (I. W. Mw.)

Michigan. One of the north central group of states of the United States, Michigan was the 26th state admitted to the union; it is popularly known as the "Wolverine state." Land area: 58,216 sq.mi. (excluding 39,960 sq.mi. of Great Lakes water surface); pop. (1950 census): 6,371,766, a gain of 21.2% since 1940. Estimated population, Jan. 1, 1953: 6,650,000. Of the state's population in 1950, 70.7% was urban and 29.3% rural (compared with a 65.7 to 34.3 ratio in 1940). Whites composed 92.9% of the population, nonwhites 7.1% (compared with a 95.9 to 4.1 ratio in 1940). Capital: Lansing (pop. 92,129). Larger cities were (1950 census): Detroit (1,849,568); Grand Rapids (176,515); Flint (163,143); Dearborn (94,994); Saginaw (92,918).

History.—In 1952 Democratic Gov. G. Mennen Williams began his fourth year in office with an announcement that his specific goals were new taxes to solve the state's financial plight, higher unemployment compensation benefits to alleviate hardships arising from the increasing number of jobless workers and

to maintain purchasing power in industrial communities, speeding up of the state's "good roads" program, reorganization of the state government, disability insurance for persons unable to work because of illness, strengthening of Michigan's educational system particularly in the field of higher education, an extensive construction program for mental hospitals and improved tuberculosis control, provision for 200 more state troopers and an effective civil defense program. At the hands of a predominantly Republican legislature, the governor's program did not meet with much success during a 13-week session beginning on Jan. 9. Of more than 800 bills introduced less than one-fourth were passed; and in only two areas, control of sex deviates and warfare against communism, did the legislature get into really new fields. Workmen's compensation benefits were lifted \$4 per week, and the limit of unemployment compensation was increased from 20 to 26 weeks.

A Straits Bridge authority was empowered to issue bonds and to construct a \$100,000,000 bridge over the Straits of Mackinac, providing no state government money was used. A \$330,429,503 general fund budget was adopted.

In April a riot in the Southern Michigan State prison near Jackson, the world's largest prison, resulted in property damage of from \$2,500,000 to \$3,000,000.

Education.—In 1950-51 elementary school enrolment was 696,289, with 23,659 teachers; secondary school enrolment 372,582, with 15,029 teachers. There were 4,841 school districts. Institutions of collegiate rank numbered 40, with a combined enrolment of 76,858 as of the fall of 1951. Lee M. Thurston was superintendent of public instruction in 1952.

Social Insurance and Assistance, Public Welfare and Related Programs.—The department of social welfare reported that during the fiscal year July 1951–June 1952 the monthly average assistance loads and the total expenditures for assistance were:

Program	Monthly average case load	Annual total payments
Old-age assistance (persons)	93,887	\$54,124,447.10
Aid to dependent children (families) (children)	24,878 57,253	28,415,542.10
Aid to the blind (persons)	1,859	1,188,093.80
Aid to the disabled (persons)	1,035	740,442.30
General assistance (cases)	26,708	12,543,595.18
(persons)	62,545	

As of June 30 there were 1,042 children who were wards of the state under the supervision of the Michigan Children's institute. As of the same date 46 blind persons were employed at the Michigan Employment Institution for the Blind. The boys' vocational school was caring for 372 socially maladjusted boys; the girls' training school had an enrolment of 312 girls.

The various state institutions of correction and their populations as of June 1952 were as follows: State Prison of Southern Michigan, 6,278; Michigan reformatory, 1,281; state house of correction and branch prison, 1,035; Detroit house of correction, 469 (male 139, female 330); Cassidy Lake Technical school, 9,210; wayward minor boys in custody, 3. Total expenditures of the department of correction amounted to \$9,716,996 (not including capital expenditures).

Communications.—The amount of highway contracts awarded for 1952 was \$42,644,345.14; of this amount \$9,334,038.36 represented the amount of contracts for structures and paving on the Edsel Ford and John C. Lodge expressways in the city of Detroit. In addition to these amounts, there were contracts totalling \$2,618,000 for the year 1952 for bridges and similar structures on other highways. The 1952 maintenance budget was \$16,200,000. The annual traffic at the Straits of Mackinac was expected to exceed 760,000 vehicles. In order to expedite the completion of the construction of the Edsel Ford and John C. Lodge expressways in the city of Detroit, an \$80,000,000 bond issue was approved and bonds negotiated, the retirement of these bonds to be made from annual "motor vehicle fund" revenues to the state, counties and cities and annual federal-aid appropriations to the state. There were 106,896 mi. of highways in the state. Railroad mileage totalled 6,807.

Banking and Finance.—As of Sept. 5, 1952, 341 state banks had total assets of \$3,154,828,447.30; three industrial banks, \$13,138,277.51; five private banks, \$4,808,983.64; six trust companies, \$41,388,378.87. Total assets of 78 national banks in Michigan on June 30 were \$3,459,310,000. There were 36 state-chartered and 35 federally chartered building and loan and savings and loan associations. Invested savings in the state-chartered associations totalled \$161,041,209; those in the federally chartered associations totalled \$343,107,469. Total state cash receipts for the fiscal year ending on June 30 were \$818,014,433.04; total disbursements, \$820,043,402.68. The state had a bonded debt of \$234,461,000. At the end of the fiscal year on June 30 there was a general fund deficit of about \$65,000,000.

Agriculture.—Good growing conditions resulted in a general field crops total tonnage of 6% above average, although 2% below the 1951 production, because of reduced acreages for most of the cash crops and lower yields on oats and barley. The tonnage of fruit produced was 4% less than the 1951 crop and 5% below average.

Manufacturing.—Shortages in raw materials proved to be a serious handicap to the manufacturing industry, though this condition was some-

Table I.—Principal Crops of Michigan

Crop	Indicated 1952	1951	Average 1941-50
Corn, all, bu.	80,688,000	69,056,000	59,155,000
Wheat, bu.	38,186,000	30,800,000	24,625,000
Oats, bu.	50,985,000	60,183,000	50,477,000

whose value exceeded \$100,000. Data for 1951 were not yet available. Michigan ranks 1st among the states in the production of gypsum and salt; 2nd in bromine, iron ore and sand and gravel; 3rd in stone; and stands 12th in the value of mineral output, with 1.94% of the U.S. total.

Microbiology: see BACTERIOLOGY.

Middle East.

The strategic importance of the middle east for the defense of the democracies against Communist aggression was early recognized by the United States. On March 12, 1947, it took the initiative in safeguarding the freedom of Greece and Turkey against encroachment by the U.S.S.R. The ancient importance of the area as a strategic centre was enhanced in recent years by the necessity of safeguarding its rich oil deposits. The growing political and social unrest in many parts of the region, especially in oil-rich Iran, an immediate neighbour of the U.S.S.R., and in Egypt and Syria; the change of regimes depending largely on the roused nationalist passions of the masses; the continuing bitter tension between Israel and the Arab states—all these elements

added to the instability of a strategically decisive area and frustrated United States and British efforts to organize the area for purposes of common defense and of common action for the improvement of social and economic conditions.

The most propitious soil for the organization of a middle eastern defense system was offered by Turkey, which not only had the largest and best equipped army in the middle east but also represented the best integrated national entity in that area. Together with Greece, Turkey became in 1952 a full-fledged member of the North Atlantic Treaty organization.

In their efforts to create a basis for a middle eastern regional defense organization going beyond Turkey and Greece, the United States and Britain sought above all to win the co-operation of Egypt, the largest Arabic-speaking country and the guardian of the Suez canal. The rise to power there of the government of Gen. Mohammed Naguib and its sweeping social reforms seemed to facilitate this task and also to prepare the way for a British-Egyptian understanding about the military protection of the Suez canal. The plan for an Allied middle east defense organization, put forward in the fall of 1951 by the United States, Britain, France and Turkey, had to be dropped in view of strong Egyptian hostility at that time; during 1952 more modest recommendations for an organization limited to machinery for consultation and planning were suggested, without, however, gaining definite shape. Meanwhile the United States and Britain continued with their plans of organizing an effective defense of the area. It was decided to build a large United States air base on the British-owned island of Cyprus at the site of a royal air force base between the capital of Nicosia and the seaport of Famagusta. Military chiefs of six western nations agreed on Oct. 21, 1952, in a meeting at Malta on plans for co-ordinating the North Atlantic treaty forces and the British defensive forces in the Mediterranean area.

A purely regional mid-eastern pact was represented by the Arab league, which started on March 22, 1945; but it was hampered from the beginning by dynastic and other rivalries and later weakened by defeat in the war against Israel, a defeat largely caused by the lack of co-operation among the Arab states. To counter these weaknesses, a joint defense and economic co-operation treaty was signed by the Arab league states April 13, 1950, ratified by the various states in 1951 and 1952 and finally came into force in August 1952. It stipulated in article II that "the contracting states consider any act of armed aggression made against any one or more of them or their armed forces, to be directed against them all. Therefore, in accordance with the right of self-defense, individually and collectively, they undertake to go without delay to the aid of the state or states against which such an act of aggression is made, and immediately to take, individually and collectively, all available steps, including the use of armed force, to repel the aggression and restore security and peace." For the implementation of this joint defense, a permanent military commission composed of representatives of the general staffs and a joint defense council, under supervision of the Arab league council, were to be formed to deal with all matters of joint defense, as well as an economic council to devise means for economic development.

At the 16th session of the Arab league council in Sept. 1952, Abdel Rahman Azzam, who had been its secretary-general from the beginning, resigned and Abdel Khalek Hassouna, former Egyptian foreign minister, was named his successor. A Syrian, Ahmed Shukeiry, was named assistant secretary-general. It was decided to place the Palestine question on the agenda of the United Nations general assembly meeting, opening in New York city in Oct. 1952. The uncertainty of Egypt's future was a retarding element in the work of the council, while on the other hand the abolition of the Egyptian monarchy, at least for all

practical immediate purposes, put an end to some of the dynastic rivalries which had disrupted plans for Arab unity.

At the end of 1952 the efforts of creating a middle east organization for common defense and economic co-operation continued to encounter serious difficulties. Neither the Arabs nor the Iranians had made up their minds whether to side openly with the west or to follow a policy of neutralism. In spite of the unsettled conditions, especially in Iran, no overt gains were made in 1952 by the Communists. On the other hand, interest in the fate of the middle eastern nations was shown also by Spain and by Pakistan. In April 1952 a large Spanish friendship mission visited the Arab states, and was warmly welcomed in Beirut, the capital of Lebanon, whose leaders were probably the most "western" Arabs in their outlook. By proposing a Mediterranean collective security pact from Cairo to Athens and from Ankara to Madrid, the Lebanese leaders wished to tie in the Arab world with the Mediterranean and to proclaim the unity of Islam and Christendom in the struggle against Communism. Lebanon is the only Arab country with a Christian majority. An opposed trend wished to link the Arab collective security pact in a pan-Islamic entente with Iran, Indonesia and Pakistan; Pakistan, the largest Mohammedan nation, was trying to assume the leadership of such an entente. Another form of this "Asian" orientation among the Arab states expressed itself in their co-operation in the "neutrality bloc" of the Arab and Asian peoples, which acted frequently as a unit in the United Nations and was active in 1952 in the defense of the Arab independence movements in the French protectorates of Tunisia and Morocco.

A world Moslem conference meeting in Karachi, Pak., in the middle of March 1952 urged the establishment of closer relations among the Moslem states and the abolition of passport and visa regulations as the first step toward evolving a common citizenship. (H. Ko.)

Mineral and Metal Production and Prices.

In Table II are shown as much of the available data on world production of minerals and metals as can be condensed into two pages. The limited space does not permit the listing of many of the minor producers, but almost all commodities for which world output is published are included. Countries that produce only one or two commodities are omitted, but the table covers nearly all which produce three or more commodities, as reported by the foreign minerals staff of the U.S. bureau of mines, with a few gaps filled from various sources. After arranging the countries on a continental basis, the position in which they are listed is determined not by alphabetical order but by their relative commercial accessibility to the United States, so far as this can be judged. The only deviation from this arrangement is the grouping together of the Soviet Union and all its sat-

ellite countries, regardless of continental location, since not only is commerce with these countries so restricted as to be of little importance but also the commercial and political interests of the group are basically opposed to those of the U.S.

While the arrangement of the table in this fashion may add a few seconds to the time required to locate a specific country, it has the offsetting advantage that the table not only shows the bulk of any country's mineral output, but at the same time indicates the approximate relative accessibility of its products to the United States.

Table I is a compilation of the quotations for the leading metals and ores on the New York and London markets at the opening of the year and on the latest dates available at the time of going to press. Inspection of the New York quotations shows that approximately half were unchanged during the year 1952, while the other half split evenly between increased and lowered prices. The trend of prices is well illustrated by the *Engineering and Mining Journal* weighted index of nonferrous metal prices which, after declining from 194.06 in Feb. 1951 to 186.15 in August and September, rose to 195.10 in February and March 1952 and then declined to 178.59 in September, the lowest level reached since Sept. 1950, compared with 154.30 in June 1950, when the Korean war began, and 132.60 in March 1950. In general, reduced prices indicated that supply was adequate for current demand, but where demand was still in the lead, prices had advanced. (See also articles on the various minerals and metals.)

(G. A. Ro.)

Mineralogy. The new beryllium mineral taffeite, $\text{MgBe}(\text{Al}_2\text{O}_4)_2$, found as a cut gem stone, was reported by B. W. Anderson, C. J. Payne, G. F. Claringbull and M. H. Hey (*Mineralogical Magazine*, vol. xxix, pp. 765-772), and also C. J. Payne (*Journal of Gemmology*, London, vol. iii, pp. 234-235). Another new gem stone mineral, named sinhalite, MgAlBO_4 , was described by G. F. Claringbull and M. H. Hey (*Mineralogical Magazine*, vol. xxix, pp. 841-849). The name bystromite was given to the mineral MgSb_2O_6 , from El Antimonio, Sonora, Mex., by Brian Mason and C. J. Vitaliano (*American Mineralogist*, vol. 37, pp. 53-57). Detailed information about the new mineral robinsonite, $7\text{PbS}_6\text{Sb}_2\text{S}_3$, from the Red Bird mine, Pershing county, Nev., and the corresponding synthetic material was given by L. G. Berry, J. J. Fahey and E. H. Bailey (*ibid.*, vol. 37, pp. 438-446); also about aurostilbite, AuSb_2 , a new mineral in the pyrite group, from the Giant Yellow Knife mine, Northwest Territories, and from the Chesterville mine, Larder Lake, Ont., by A. R. Graham and S. Kaiman (*ibid.*, vol. 37, pp. 461-469).

The important "Survey of the Study of Hardness" with its extensive bibliography by J. A. Kohn was published as a 16-page supplement to the April 1952 number (vol. 12, no. 137) of the *Industrial Diamond Review* (London). "Abrasion Hardness" was discussed by T. A. Jaggar (*ibid.*, vol. 12, pp. 53-58). Further studies on the "Inclusions in Diamonds" were reported by Edward Gubelin (*Journal of Gemmology*, vol. iii, pp. 175-187, and *Gemmologist*, London, vol. xx, pp. 241-243).

The following researches on radioactive compounds appeared: "Pitchblende from Lake Athabaska, Canada," by E. J. Brooker and E. W. Nuffield (*American Mineralogist*, vol. 37, pp. 363-385); "Soddyite," by D. H. Gorman (*ibid.*, vol. 37, pp. 386-393); and "Synthesis and X-ray Study of Uranium Sulphate Minerals," by R. J. Traill (*ibid.*, vol. 37, pp. 394-406). Two articles helpful in the determination of colour in minerals were published by M. D. S. Lewis, "Colour Perception in Gemmology" (*Journal of Gemmology*, vol. iii, pp. 249-267) and "Measurement of Colour" (*ibid.*, vol. iii, pp. 289-304). L. C. Trumper discussed the use of "Colour Filters for Gem Testing" (*ibid.*,

vol. iii, pp. 149-163). Improved methods for the testing of pearls, whether natural or cultured, were described by L. B. Benson of the Gem Trade laboratory, New York city (*Gems and Gemology*, vol. vii, pp. 107-112).

The following texts were published: *Igneous and Metamorphic Petrology* by F. J. Turner and Jean Verhoogen; *Struktur und Eigenschaften der Krystalle*, by H. G. F. Winkler, Berlin, Ger.; *Optical Crystallography* (2nd ed.), by E. E. Wahlstrom; *Elements of Optical Mineralogy* (4th ed., part ii, "Descriptions of Minerals"), by A. N. Winchell and Horace Winchell; Dana's *Manual of Mineralogy* (16th ed.) by C. S. Hurlbut, Jr.

Frederick E. Wright of Washington, D.C., long recognized internationally as a distinguished mineralogist and petrologist, was designated as the 11th recipient of the Washington A. Roebbling medal of the Mineralogical Society of America. Wright had made important contributions to the development and manufacture of optical glass in the United States; in addition he had conducted significant studies of the surface features of the moon. Minnesota. A north central state, admitted to the union on May 11, 1858, Minnesota includes the northernmost land of the United States—the northwest angle. It is variously known as the "North Star" state, "Gopher" state and "land of 10,000 lakes." Its water area covers 4,059 sq.mi. of its total area of 84,068 sq.mi. The population according to the 1950 census totalled 2,982,483, an increase of 6.8% over 1940. Of this total, 54.5% lived in cities of 2,500 or more and in the urban fringe areas; nonwhites represented slightly less than 1%. The estimated 1951 population was 3,018,163. Three cities had a population of more than 100,000—St. Paul, the capital city, with 311,349; Minneapolis with 521,718; and Duluth with 104,511.

History.—There was no session of the legislature in 1952. C. Elmer Anderson completed his first full year as governor. Mike Holm, secretary of state continuously for 33 years, died during the year and his wife, Mrs. Virginia Holm, was appointed to the office. All other executive officers continued in office. These included J. A. A. Burnquist, attorney general; Valdimar Bjornson, treasurer; and Stafford King, auditor.

Education.—Approximately \$164,080,720 was spent by the 6,485 public school districts in Minnesota for 1951-52. This amount provided for 336,545 pupils in 4,650 elementary schools, 186,551 in 651 secondary schools, 1,039 in 9 junior colleges and 151 in 10 teacher-training departments. These pupils were taught by 12,471 elementary teachers, 9,298 secondary teachers, 125 teachers in junior colleges and 10 in teacher-training departments. In addition, five teachers' colleges were operated from public funds. For the support of these public elementary and secondary schools, the state contributed \$55,547,447, revenue from trust funds and the state income tax. Dean M. Schweickhard was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the fiscal year ending June 30, 1952, a monthly average of 96,142 persons received financial assistance amounting to \$52,454,374. Among those 65 years of age and over, there were 106,314 receiving either old-age assistance or old-age and survivors insurance or both in June. As of March 31, 9,292 children were receiving services from public welfare agencies. Children receiving services from physicians under the Minnesota Crippled Children's program during the year 1951 totalled 3,844.

About 825,500 workers were covered by the Minnesota Employment and Security law during 1951. Their wages amounted to \$1,868,851,700 for the year. An estimated \$11,715,000 was paid in unemployment compensation benefits during 1952.

On Oct. 1, 1952, the state prison and two reformatorys had a total of 1,765 inmates. Wards of the Minnesota Youth Conservation commission as of June totalled 399 in correctional institutions and camps plus 141 in diagnostic centres. October counts showed the eight state mental hospitals as having 9,244 patients, the two hospitals for mentally deficient 4,161. Gillette Hospital for Crippled Children had 202 patients while the three special schools for the deaf, blind and mentally deficient had 751.

Communications.—State trunk highways totalled 11,877 mi. in 1952, country roads 42,934 mi., township roads 54,538 mi., municipal streets 8,815 mi. plus 2,002 mi. of state national parks and institutional roads. Fiscal year (June 30, 1952) expenditures for construction and maintenance

of its highway system totalled \$54,684,911. With final payments on principal and interest totalling \$2,690,000, the department became bond debt-free for the first time since it was organized in 1921.

Railroad main line trackage totalled 8,343 mi., including 13 mi. of electrified, for the 22 railroads operating in the state. Another 4,328 mi. was reported for second main line, siding and yards.

Of the 114 airports in the state, 89 were municipally owned. Seaplane bases totalled 16 with 262 private landing strips reported. River barge tonnage receipts at St. Paul and Minneapolis through Aug. 1952 amounted to 751,514 tons while shipments totalled 52,416 tons.

Banking and Finance.—Minnesota's 682 state and national banks reported total resources of \$3,412,605,000 on June 30, 1952, compared with \$3,197,032,000 for 681 banks in 1951.

Represented were 499 state banks, 1 mutual savings bank and 4 trust companies reporting deposits of \$1,058,893,000, an increase of \$71,587,000, and resources of \$1,147,831,000, an increase of \$77,882,000. Deposits for the 178 national banks were \$2,092,535,000, an increase of \$128,409,000, with resources totalling \$2,264,774,000, an increase of \$137,691,000.

The 43 state-chartered savings, building and loan associations reported resources of \$117,281,000 in 1952 compared with 42 reporting \$106,191,000 in 1951. The 31 federal savings and loan associations had resources of \$350,780,000 in 1952 compared with \$301,292,000 the previous year. The 289 state-chartered credit unions reported assets of \$31,100,000 as of Dec. 31, 1951, while 52 federal credit unions had \$1,658,000 in assets.

Net disbursements of the state government (exclusive of public debt redemption, stores for resale, annuities and pensions, land and interest in land) totalled \$401,066,844 for the fiscal year ending June 30, 1952, compared with \$401,446,189 in 1951. Total state indebtedness in bonds and certificates was lowered by a net \$8,400,000 during the year to \$118,905,090 as of June 30, 1952. The four principal state trust funds totalled \$218,948,170 on June 30, 1952, compared with \$201,944,964 in 1951. Individual balances were as follows: internal improvement land, \$377,262; swampland, \$20,417,508; permanent school, \$167,502,992; permanent university, \$30,650,409.

Agriculture.—Minnesota farmers received \$1,287,000,000 during 1951 from the sale of crops, livestock and livestock products, thereby retaining its rank of fifth among states. Of this total cash income, \$986,000,000 came from the sale of livestock and livestock products while the remainder of \$301,000,000 was derived from the sale of crops. Cash farm income for the first six months of 1952 totalled \$588,000,000, 3% less than in the same period of 1951.

Table I.—Principal Crops of Minnesota

Crop	Indicated 1952	1951	Average 1941-50
Corn, all, bu.	269,331,000	215,038,000	222,046,000

Rye, bu.	1,986,000	2,850,000	2,317,000
Apples, bu.	182,000	342,000	169,000

Source: U.S. Department of Agriculture.

Manufacturing.—Minnesota's estimated 6,000 manufacturing establishments employed 223,535 workers in Sept. 1952, an increase of 5% over 1951. Weekly earnings averaged \$69.52. Covered wages of manufacturing industries (unemployment compensation) totalled \$730,096,719 in 1951. Value added by manufacturing exceeded the \$1,200,000,000 reported for 1950. (C. E. AN.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Minnesota in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Min-

Table II.—Mineral Production of Minnesota

Mineral	(Short tons)			
	Quantity	Value	Quantity	Value
Clays	129,000	\$ 151,000	134,000	\$ 153,000
Coke*	834,000	13,030,000	782,000	12,694,000
Iron ore	72,283,000	311,716,000	62,656,000	239,859,000

Missiles, Guided: see MUNITIONS OF WAR.

Missions, Foreign (Religious). During 1952, as in the two previous years, the greatest stresses on foreign missions were in China

and Korea. In China the Communist regime intensified its restrictions on the churches, both Catholic and Protestant. The expulsion of missionaries continued, regardless of nationality or denomination. The Communists seemed not to wish to kill them, but through public trials and meetings to make the deportation of missionaries contribute to the antiwestern propaganda. Missionaries were ejected on various charges, among them being that they were spies, were resisting the recruiting of volunteers for the Chinese forces in Korea and in other ways were seeking to subvert the Communist revolution. Of the few Protestant missionaries who remained, some were in prison, some were under house arrest and the others were keeping to their homes with little or no contact with the Chinese.

It was reported that during the first half of the year 696 Catholic missionaries were deported. In July the total of foreign Catholic personnel left in China was said to be 1,163. While ostensibly permitting religious liberty, in one way or another the Communists intensified their pressure on Chinese Christians.

The stabilizing of the front between the belligerents in Korea permitted the active prosecution of missions in the region protected by the United Nations. Much of this was by the Korean Christians. Many converts were won among the prisoners of war.

In Japan the end of the occupation brought no immediate change in the status or program of missions. The (Protestant) International Christian university, supported mostly by funds from the United States, began classes in May.

The improvement in the internal political picture in Burma eased the missionary situation, especially among the Karens, the racial group among whom were the majority of the Christians of the country.

The heightened nationalism in Iran, intensified by the dispute with the British over oil, brought severe restrictions on missions in that country.

The striking growth of Christianity in Africa south of the Sahara continued. Most, although not all, was accomplished by Catholic missionaries. The overwhelming majority of the Catholic missionaries were from Europe, more from France than from any other country, but the number from the United States and Canada, especially the latter, was mounting. African priests were increasing in number, however, and an additional African bishop was appointed. Africa vied with Latin America as the region to which the largest number of Protestant missionaries were sent from the United States. In June a conference on African missions was held at Springfield, O., under joint Protestant auspices, with a significant African delegation and with representatives from various western powers having colonial possessions in Africa.

The growth of Protestantism in Latin America continued. More Roman Catholic missionaries from the United States were at work in Latin America than in any other area.

In July a conference on the missionary obligation of the church was held in Willingen, Waldeck, Ger., by the International Missionary council with delegates from about 50 countries. Its purpose was to plan for the next steps in the worldwide program of Protestant missions. It was marked by close and harmonious collaboration of Protestants from the Americas, Europe, Asia and Africa. (K. S. L.)

Mississippi. A southern state of the U.S., admitted to the union in 1817, Mississippi is popularly known as the "Magnolia state"; area: 47,716 sq.mi. (47,248 sq.mi. land and 468 sq.mi. water); pop. (1950): 2,178,914, a decrease of 0.2% since 1940; capital: Jackson (98,271). Other cities of more than 20,000 population (1950 census): Biloxi (37,425); Greenville (29,936); Gulfport (22,659); Hattiesburg (29,474);

Laurel (25,038); Meridian (41,893); Natchez (22,740); Vicksburg (27,948). Of the state's population in 1950, 607,162 or 77.9% were urban.

History.—For 1952–56 the elected officials of the state were: governor, Hugh L. White; lieutenant governor, Carroll Gartin; secretary of state, Heber Ladner; attorney general, J. P. Coleman; state treasurer, Newton James; auditor of public accounts, William D. Neal; superintendent of education, J. M. Tubbs; commissioner of agriculture, S. E. Corley; commissioner of insurance, Walter Dell Davis; state tax collector, Mrs. Thomas Bailey; state land commissioner, Walter L. McGahey; supreme court clerk, Tom Q. Ellis.

In 1951 unusual activity centred around, first, a road development program, and second, the development and execution of plans for further expansion of schools and colleges for both white and Negro students.

A new college for Negroes was established at Indianola, a town in the Mississippi delta. Progress was made on the construction of new teaching and hospital buildings for the new four-year school of medicine of the University of Mississippi, located at Jackson. The school was to be in operation by 1954, under the jurisdiction of, but separate from, the university at Oxford.

Education.—In 1951–52 there were 970 white elementary schools in Mississippi and 2,615 Negro elementary schools, a total of 3,585. The enrolment in elementary schools was 463,116, of whom 215,497 were whites and 247,619 Negroes. The state had 486 approved white high schools and 180 approved Negro high schools. The enrolment of these approved high schools plus enrolments in nonaccredited schools gave a total enrolment of 87,666 in 1951–52. There were 9,896 white elementary and high school teachers (including superintendents and principals) and 8,753 Negro elementary and high school teachers (including superintendents and principals), a total of 16,649 teachers. The total enrolment in white elementary and high schools was 278,654; in Negro elementary and high schools, 272,128.

Social Insurance and Assistance, Public Welfare and Related Programs.—From July 1, 1951, through June 30, 1952, the state department of public welfare in Mississippi paid \$13,626,278 to 67,072 recipients of old-age assistance; \$829,310 to 3,208 recipients of aid to the blind; \$2,850,200 to 14,591 families for 42,905 dependent children; and \$168,286 to 1,097 recipients for aid to the permanently and totally disabled. Special child welfare workers were assigned to 48 county departments of public welfare and to Oakley Training school.

There were training units in two counties in which child welfare workers in training were given instruction before being assigned as workers to a county unit. The federal-state-county program of foster boarding care for children maintained 355 children in foster homes at a cost of \$92,934.42.

Communications.—In 1951–52 the state maintained 7,349.1 mi of highways; the counties maintained approximately 53,751 mi. In the fiscal year 1950–51 the state maintenance expenditures were estimated at \$4,773,891. The total mileage of railroads in the state on Dec. 31, 1951, was 3,838.28.

Banking and Finance.—On June 30, 1952, there were 178 state banks in Mississippi, with 23 branch banks and 43 branch offices; there were 24 national banks. The resources of state banks were \$644,485,814.79 and the total deposits were \$596,424,157.79; the resources of the national banks were \$237,884,961.71 and the total deposits were \$221,934,960.09. As of June 30, 1952, the balance in the general fund account was \$27,615,111.67; the special fund account was \$30,687,485.15. On June 30, 1952, the full faith and credit debt of the state of Mississippi was \$4,761,000; outstanding highway bonds (payable from gasoline tax) amounted to \$61,945,000, making a total debt of \$66,706,000.

Agriculture.—The 1950 census reported 251,382 farms of a total of 20,710,770 ac. In 1950 the total harvested acreage of 52 principal crops was 5,712,000 ac. The 1950 receipts from farm marketings were \$488,220,000, of which \$354,477,000 were from crops and \$134,245,000 from livestock products; the value of farm products consumed in farm households was \$87,852,000.

Manufacturing.—The value of manufactured products in Mississippi for

Table II.—Mineral Production of Mississippi

(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Clays	562,000	\$ 2,184,000	508,000	\$ 1,654,000
Natural gas (thousand cu.ft.).	114,153,000	7,192,000	68,062,000	4,199,000
Natural gasoline (bbl.)	780,000	2,274,000	776,000	2,264,000
Petroleum (bbl.)	38,236,000	88,330,000	37,966,000	93,400,000
Petroleum gases (bbl.)	532,000	864,000	495,000	572,000
Sand and gravel	2,764,000	1,986,000	1,943,000	1,330,000
Other minerals		115,000		292,000
Total		\$102,945,000		\$103,711,000

the year 1951 was \$961,000,000, compared with \$914,000,000 in 1950. Income from pay rolls and profits totalled \$324,000,000 in 1951, compared with \$297,000,000 in 1950. (A. B. Bu.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Mississippi in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Mississippi ranks 25th among the states in the value of mineral output, with 0.87% of the U.S. total.

Missouri. A west north central state of the U.S., Missouri was admitted to the union in 1821; it is popularly known as the "Show Me state." Area: 69,674 sq.mi., of which 448 sq.mi. are water. Pop.: (1950 census) 3,954,653 (61.5% urban, 38.5% rural; 90.2% white, 9.8% nonwhite). Capital: Jefferson City (1950 census, 25,099). Largest cities (1950 census): St. Louis (856,796); Kansas City (456,622); St. Joseph (78,588); Springfield (66,731); University City (39,892); Joplin (38,711); Independence (36,963).

History.—The 66th general assembly convened in regular session on Jan. 3, 1951, and adjourned on April 30, 1952. Both houses had Democratic majorities, the house of representatives consisting of 85 Democrats and 69 Republicans (with 4 vacancies), the senate of 21 Democrats and 13 Republicans. The legislature proposed that two constitutional amendments be voted on at the general election on Nov. 4, 1952: one to limit regular sessions of the general assembly to five months; the other to permit school districts to increase their debt from 5% to 10%.

The greatest flood in the history of the Missouri river occurred during April 1952, affecting Missouri and six other states. It was caused by the rapid melting of heavy snow in Montana, North Dakota and South Dakota. Missouri's loss was \$53,842,000, which was the largest of the flood-affected states.

In the primary election on Aug. 5, 1952, Phil M. Donnelly de-

FREIGHT TERMINAL opened by the Missouri Pacific railroad in St. Louis, Mo., in 1952, adjoining its Lesperance street yards. The new terminal included 12 service tracks and accommodated 180 freight cars

feated Phil Welch for the Democratic nomination for governor, and Howard Elliott defeated Stanley Dale for the Republican nomination.

In the same election Stuart Symington defeated J. E. Taylor (supported by President Truman) for the Democratic nomination for U.S. senator, and James P. Kem (incumbent) defeated William McKinley Thomas for the Republican nomination.

The major state officers (Oct. 1952), all Democrats, were: Forrest Smith, governor; James T. Blair, Jr., lieutenant governor; Walter H. Toberman, secretary of state; W. H. Holmes, auditor; M. E. Morris, treasurer; J. E. Taylor, attorney general.

Education.—For the school year ended June 30, 1952, the public school system consisted of about 5,500 elementary schools, with 522,675 pupils and 17,839 teachers; 665 secondary schools, with 150,408 pupils and 6,919 teachers. Hubert Wheeler was state commissioner of education.

In Oct. 1952 about 23,003 World War II and Korean war veterans were enrolled in Missouri in the various training programs: farm training, 10,012; job training, 1,394; institutional (trade schools, universities, etc.), 11,597.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ended June 30, 1952, unemployment insurance totalled \$14,162,725, paid to about 175,000 persons. For the year ended June 30, 1952, old-age assistance amounted to \$69,282,883, aid to dependent children \$14,222,932, general relief \$3,526,972, pensions for the blind \$620,245, aid to the blind \$1,078,821 and aid to the disabled \$5,741,225. In June 1952, 131,377 persons received old-age assistance, 21,679 families (54,258 children) aid to dependent children, 9,101 persons general relief, 610 persons blind pensions, 2,680 persons aid to the blind and 11,562 aid to the disabled. During the year ended June 30, 1952, the state penitentiary had an average of 2,975 inmates per day, the reformatory (Algoa) 444, and the expenditures for these institutions amounted to \$2,223,144. On June 30, 1952, the three state training schools (Boonville, Chillicothe and Tipton) had a population of 238 boys and 163 girls, and for the year ended June 30, 1952, their expenditures totalled \$771,191.

Communications.—On Dec. 31, 1951, Missouri had 19,521 mi. of state highways and 80,643 mi. of rural roads. During 1951 the state highway department spent \$53,071,997 (state and federal funds), of which \$24,813,407 was for construction and \$13,997,510 was for maintenance. In 1951 railroad mileage totalled 6,735. There were 1,230,138 telephones in use on Sept. 30, 1952.

Banking and Finance.—On Dec. 31, 1951, Missouri had 496 state banks with deposits of \$2,467,571,000 and resources (loans and investments) of \$2,209,055,000; 79 national banks with deposits of \$1,506,959,000 and resources (loans and investments) of \$1,454,398,000. On June 30, 1952, Missouri had 153 savings and loan associations with resources of \$415,002,400. During the fiscal year ended June 30, 1952, receipts in all state funds totalled \$280,937,364; disbursements, \$279,378,655. On June 30, 1952, the unobligated balance of all funds (state and federal) was \$119,490,136. The state debt (road bonds) on July 1, 1951, was \$30,000,000 and on June 30, 1952, \$22,000,000.

Agriculture.—During 1951 cash income from crops and livestock was \$1,160,372,000, and cash income from government payments was \$10,866,000. The value of Missouri's 1951 crops was \$560,642,000, and the

value of the 1952 crops, harvested from an estimated 13,300,000 ac., was estimated at \$525,000,000.

Manufacturing.—The number of persons employed in Missouri's manufacturing industries in 1947 was 327,515, and salaries and wages totalled \$827,184,000. The value added by manufacture of products in 1947 totalled \$1,623,145,000, compared with \$581,804,000 in 1939, when the previous U.S. census of manufactures was taken. (R. P. Br.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Missouri in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. Missouri ranks 1st among the states in the production of lead and 2nd in barite, and stands 23rd in the value of mineral output, with 0.95% of the U.S. total.

Monaco. This sovereign principality on the Mediterranean coast, 9 mi. E. of Nice, Fr., is bounded on all land sides by the French *département* of Alpes Maritimes. Area: 0.6 sq.mi. Pop. (1946 census): 19,242, including 1,975 Monacans; 10,522 French and 6,745 other foreigners; (1951 est.) 21,000. Ruler, Prince Rainier III; minister of state in 1952, Pierre Voizard.

History.—In May 1952 there was a rumour that the 52-year-old Princesse Ghislaine, a former actress and the second wife of Prince Louis (who died on May 9, 1949), had been evicted from the palace by Prince Rainier. On May 9 a spokesman of the Monacan government denied the rumour, but it was known that a dispute existed between Prince Rainier and Princesse Ghislaine about Louis' will, in which he had left all crown properties to his grandson and successor but half of his private fortune to his wife (about £150,000). Prince Rainier claimed that Louis had no right to make separate legacies and that all belonged to the crown. The court of revision, consisting of ten French lawyers chosen by the French foreign office, invalidated the will. The Société des Bains de Mer, which owned the casino and most of the hotels, intervened, and a compromise in the form of a pension for Princesse Ghislaine was agreed upon.

The Académie Internationale du Tourisme, founded by Prince Rainier in 1951, held in August its second session at Monte Carlo. The previous year it had organized a competition for the best definition of the term *tourisme*. It awarded on Aug. 23 the first prize to R. de Meyer, a Belgian, for the following definition: "A collective term for human movement and its attendant activities, caused by the exteriorization and fulfillment of the desire to escape that is more or less latent in everybody."

Finance.—Budget (1950 actual): revenue 1,085,500,000 fr.; expenditure 1,182,800,000 fr. (including 126,000,000 fr. extraordinary for equipment and reconstruction). The monetary unit is the French franc, valued in 1952 at .2857 cents U.S.

Monetary Units: see EXCHANGE CONTROL AND EXCHANGE RATES.

Money Markets: see BANKING.

Mongolian People's Republic. This soviet-dominated people's republic of eastern Asia is bounded north by the U.S.S.R. and east, south and southwest by China. Area: 606,000 sq.mi. Pop.: no census ever taken; estimates vary from 850,000 (soviet, 1941) to 2,078,000 (Chinese, 1945); U.N. est. (1951) 885,000. Language: Mongol. Religion: Lamaist-Buddhist. Capital: Ulaan Bator (pop., 1951 est., 80,000). Chairman of the presidium of the Great Hural (parliament): G. Bumatsende. Chairmen of the council of ministers in 1952: Khorloghiyin Choibalsan and from May 28, Yumzhaghiyin Tsedenbal.

History.—The year 1952 was marked by the death on Jan. 26 of Marshal Choibalsan, the prime minister and commander in

chief, who died from cancer in Moscow; his body was escorted to Ulan Bator by a delegation of the soviet government headed by M. P. Tarasov, chairman of the presidium of the Russian Soviet Federated Socialist Republic, and by Marshal S. M. Budenny. The burial on Feb. 9 was attended by a Chinese delegation headed by the acting chief of staff.

In Choibalsan the Kremlin had lost a faithful friend not easy to replace. Although the Mongolian Great Hural met from February 28 to March 1 for its second session, no successor was appointed. Not until May 28 did the presidium of the Great Hural appoint as premier Yumzhaghiyin Tsedenbal, who had been secretary-general of the Mongolian People's Revolutionary (Communist) party since Sept. 1945 and deputy premier from Dec. 1948.

Tsedenbal visited Moscow in August, and was greeted at the airport not only by A. I. Mikoyan, a deputy premier, and A. Y. Vishinsky, minister of foreign affairs, but also by Chou En-lai, the Chinese premier and minister of foreign affairs, who was also visiting the soviet capital. Tsedenbal was received by Joseph Stalin on Sept. 5 and left Moscow on Sept. 23. Four days later he reported on his Moscow talks to the council of ministers at Ulan Bator. It was believed that the construction of a new direct railway link between Irkutsk and Peking through Ulan Bator was decided.

On Sept. 28 Tsedenbal arrived in Peking accompanied by M. Lhamsurun and B. Shirendyb, the ministers of foreign affairs and education. The Mongolian delegation was greeted at the airport by Chou En-lai and the following day was received by Mao Tse-tung. On Oct. 4 a Chinese-Mongolian agreement for economic and cultural co-operation was signed. This was the first official visit by a Mongolian premier to China.

Education.—Schools (1952): elementary and secondary 400; technical 14. Further education at a teachers' training college and the university college of Ulan Bator. Literacy: (1947) 42.5%; (1952) nearly 90%.

Finance.—Budget (1952 est.): revenue 380,495,500 tugriks; expenditure 374,040,300 tugriks. Monetary unit: tugrik, at parity with the rouble. (K. SM.)

Montana. Popularly known as the "Treasure state," Montana is the largest of the northwestern states and the third largest in the United States, with a land area of 145,878 sq.mi. and a water area of 1,260 sq.mi. The federal census of 1950 showed a population of 591,024, an increase of 5.6% over the population of 1940. Principal cities: Helena, the capital (17,581); Great Falls (39,214); Butte (33,251); Billings (31,834); Missoula (22,485); Bozeman (11,325); Anaconda (11,254); Kalispell (9,737); Miles City (9,243); Havre (8,086). The urban population numbered 258,034 or 43.7% compared with 37.8% in 1940. Of the state's total population, 572,038 or 96.8% were whites of whom 528,919 were native born. Other races, totalling 18,986, including 16,606 Indians and 1,232 Negroes.

History.—Incumbents in the principal state offices in 1952 were John W. Bonner (Dem.), governor; Paul Cannon (Dem.), lieutenant governor; Sam W. Mitchell (Dem.), secretary of state; Arnold H. Olsen (Dem.), attorney general; John E. Henry (Rep.), treasurer; John J. Holmes (Dem.), auditor; and Mary M. Condon (Dem.), superintendent of public instruction. In the biennial election of 1950, Republicans gained control of both houses of the state legislature. No legislative session was held in 1952.

The "Little Hoover" Commission on Reorganization of State Government, appointed for two years by the 1951 legislative session, held monthly meetings in 1952. Its close scrutiny of state personnel methods revealed the lack of any well-defined classification of positions, with many inequities in wage scales as a result. This led to a recommendation, to be presented to the 1953 legislature, for the establishment by law of a state

personnel commission of four members, to be appointed by the governor and headed by a full-time director. Noting the weakened position of the legislature because of the trend toward wide grants of authority to executive administrative agencies, the reorganization commission further recommended that the 1953 legislature create a permanent state legislative council to consist of eight members—four representatives and four senators—which would function on a year-round basis and keep the legislature in touch with changing conditions which required legislative action. Such a council, it was urged, would improve legislative planning and leadership and restore to that branch of government its rightful place in a governmental system of divided powers. Other recommendations by the reorganization commission called for the creation of three interdepartmental advisory councils, designed to co-ordinate related activities of state departments concerned with public welfare, health and institutions; natural resources and development; and agriculture and livestock.

An amendment proposed for referendum in Nov. 1952 would empower the state legislature to increase the terms of office of elective or appointive officials in counties, townships and municipalities to a maximum of four years. Initiative measure no. 55, appearing on the voter's ballot at the same time, would make possible an increase of another one cent per gallon in the tax on gasoline.

Education.—There were 1,209 elementary schools in Montana in 1951-52, with an enrolment of 84,111 and a teaching staff of 3,576. There were 176 high schools with 27,599 students and 1,334 teachers. The total cost of operating elementary and secondary schools was \$28,531,309 during the fiscal year 1951-52. An outstanding development in Montana education in the past few years had been the inclusion of nearly all of the Indian children in the state in the public schools.

Social Insurance and Assistance, Public Welfare and Related Programs.—Approximately 23,651 persons received public assistance in the fiscal year 1951-52. Grants totalling \$11,660,238 were distributed as follows (figures in parentheses indicate the average number of recipients per month): old-age assistance (11,369) \$7,001,311; aid to dependent children (8,448) \$2,431,337; aid to needy blind (532) \$360,027; subsistence (768) \$280,927; medical care (821) \$169,036; aid to disabled (1,030) \$686,192; hospitalization (648) \$678,670; burials (35) \$52,738. Unemployment benefits of \$2,112,925 were paid to 16,040 persons, an average of \$18.35 per week for 8.9 weeks or \$131.72 per claimant. Correctional institutions with their average populations and total expenditures for 1951 were: Montana State prison, 570 inmates, \$435,996; state industrial school, 125 inmates, \$181,778; vocational school for girls, 36 inmates, \$98,423.

Communications.—In 1952 the state highway commission maintained 9,032 mi. of highways, of which 1,044 mi. were unsurfaced. The total local rural mileage system totalled 60,679 with 12,985 mi. surfaced with gravel or oil. State highway expenditures during the fiscal year 1951-52, including federal aid, were \$21,148,111, of which \$11,539,562 was for construction and \$6,719,290 for maintenance. The total number of airports listed on the U.S. aeronautical charts for Montana in 1952 was 118, not including any of the 210 landing strips maintained by farmers and ranchers on their own individual properties and used intermittently with the season's need. The number of registered aircraft was 1,113, of which 812 were in active service. The railway mileage was 5,241. The number of telephones as listed for July 1, 1952, was 158,481.

Banking and Finance.—On June 30, 1952, Montana had 71 state banks with deposits of \$292,521,423 and assets of \$307,906,925; and 39 national banks with deposits of \$298,944,000 and total assets of \$312,680,000. There were 15 building and loan associations with assets of \$28,459,121. For the fiscal year ending June 30, 1951, the net state revenue, all sources, was \$79,228,275, and the expenditures totalled \$75,923,255. The gross debt of the state on July 1, 1951, was \$6,586,000 and the net debt \$5,423,791.

Agriculture.—The aggregate production in 1952 for the 11 principal crops of Montana was forecast at only 7.6% below average despite the early season's drought which covered much of the eastern and central part of the state. The forecast of 77,458,000 bu. for spring and winter wheat was nearly 5,000,000 bu. above the ten-year, 1941-50, average, but 21% less than the record 1951 crop of nearly 98,000,000 bu. With the excep-

Table 1.—Principal Crops of Montana

Crop	Indicated 1952	1951	Average 1941-50
Wheat, bu.	77,458,000	97,988,000	72,532,000
Hay, tons	2,542,000	2,363,000	2,588,000
Barley, bu.	12,906,000	12,880,000	16,563,000
Sugar beets, tons.	481,000	537,000	774,000
Oats, bu.	9,261,000	10,200,000	12,999,000
Potatoes, bu.	2,475,000	2,150,000	2,337,000
Corn, bu.	2,030,000	2,392,000	3,073,000
Dry beans, 100-lb. bags	112,000	141,000	297,000
Flaxseed, bu.	70,000	198,000	1,394,000
Dry peas, 100-lb. bags	61,000	62,000	273,000
Rye, bu.	84,000	94,000	307,000

Source: U.S. Department of Agriculture.

tions of barley, hay and potato production, the volume of all crops harvested was less than in 1951. The cash farm income in 1951 was \$288,000,000, slightly more than 28% of the record total personal income of \$1,026,000,000 paid to individuals in Montana during that year.

Table II.—Industrial Products of Montana

Products	1951	1950	1949
Cheese, lb.	2,775,000	3,010,000	2,965,000
Butter, lb.	7,115,000	8,340,000	8,025,000
Ice cream, gal.	2,719,000	2,797,000	2,964,000
Beet sugar, cwt.	1,570,000	2,250,000	1,940,000
Beer, bbl.	210,249	199,302	200,594
Gasoline, gal.	241,794,090	293,240,097	255,169,417
Electric power generated, kw.hr.	3,234,500,000	3,135,752,000	2,915,361,000
Lumber, bd. ft.	—	—	458,520,000

Manufactures.—The total value added by manufacture (1950 census) in the 900 manufacturing establishments in Montana was \$107,837,000, compared with \$92,258,000 for 652 manufacturing establishments in 1947. Estimates of the state unemployment compensation commission indicated that during the fiscal year 1951-52 an average of 18,300 covered employees were employed in manufacturing in Montana, with total wages of \$66,738,589. The official estimate for total employment for all Montana, aside from agriculture, during the same period was 151,700. In 1951 manufacturing pay rolls constituted only 6.3% of aggregate incomes in Montana compared with 23.9% nationally, indicating the lack of industrial development in the state. (E. E. B.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in Montana in 1949 and 1950, listing all items

Table III.—Mineral Production of Montana

(Short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Coal	2,520,000	\$ 5,861,000	2,766,000	\$6,312,000
Copper	54,000	22,663,000	57,000	22,305,000
Gold (oz.)	52,000	1,812,000	53,000	1,845,000
Lead	20,000	5,297,000	18,000	5,687,000
Manganese ore	131,000	↑	122,000	5,068,000
Natural gas (thousand cu. ft.)	39,186,000	2,077,000	35,291,000	1,962,000
Natural gasoline (bbl.)	98,000	350,000	86,000	210,000
Petroleum (bbl.)	8,109,000	20,430,000	9,118,000	23,520,000
Petroleum gases (bbl.)	153,000	450,000	144,000	431,000
Phosphate rock	235,000	1,496,000	397,000	2,574,000
Sand and gravel	9,044,000	5,140,000	6,682,000	3,366,000
Silver (oz.)	6,591,000	5,965,000	6,327,000	5,726,000
Stone	919,000	949,000	603,000	564,000
Zinc	68,000	19,221,000	54,000	13,440,000
Other minerals	—	11,678,000	—	5,060,000
Total	—	\$103,389,000	—	\$98,070,000

whose value exceeded \$100,000. Data for 1951 were not yet available. Montana ranks first among the states in the production of manganese ore, second in zinc and third in silver, and stands 24th in the value of mineral output, with .87% of the U.S. total.

Montreal. A city in the province of Quebec, Can., first called Ville Marie, Montreal was founded in 1642. The census of 1951 gave the city proper a population of 1,021,520 and that of greater Montreal 1,395,400.

The port of Montreal is the largest in Canada. Deep-sea arrivals (commercial) in the first nine months of 1952 numbered 1,080, with a net tonnage of 3,668,585. The number of coastal or inland vessel arrivals and other commercial vessels in the same period was 2,489, with a net tonnage of 2,852,901.

The total of water-borne cargo tonnage which passed through the port during the first nine months of 1952 was 11,312,009; this consisted of 5,066,283 inward (foreign 2,518,701, domestic 2,547,582) and 6,245,726 outward (3,941,277 foreign, 2,304,449 domestic).

The assessed value of real estate as of April 30, 1952, was \$1,763,732,310, of which \$1,369,738,816 was taxable and \$393,993,494 was exempt from taxation.

During the nine months ending Sept. 30, 1952, building permits were issued for 2,978 new buildings having a value of \$51,442,000, and for 2,089 repairs having a value of \$6,585,325.

Mormons. Probably the outstanding event in the church in 1952 was the tour of the European missions of the church by David O. McKay, president of the Church of Jesus Christ of Latter Day Saints. He spent two months visiting the members in Great Britain, Norway, Sweden, Finland,

Denmark, the Netherlands, France, Belgium, Switzerland and western Germany. There were approximately 35,000 members in this area. One of the principal results of this tour was the decision made to build a temple in Europe, to be located in Switzerland.

The building program of the church steadily progressed during the year, with 137 churches completed and dedicated, most of them in the United States.

At the time of the spring runoff of snow water from the mountains east of Salt Lake City, the high water flooded considerable areas in that city. The welfare organization of the church took care of the evacuation of residents of flooded areas and largely carried out the subsequent cleaning up and restoration measures after the waters abated. All services were supplied by the welfare organization through donated, volunteer labour, without the expenditure of money by the organization. Church-wide, the welfare organization in 1952 extended help in the form of food, clothing, shelter and fuel to about 40,800 persons. (See also CHURCH MEMBERSHIP.) (J. R. CL.)

Morocco, French. A sultanate of northwest Africa, with both Mediterranean and Atlantic coast lines, Morocco is divided into French protectorate (to which the historical and statistical sections below refer), Spanish protectorate (see SPANISH COLONIAL EMPIRE) and international zone of Tangier (*q.v.*). Areas and populations are shown in the table.

	Area (in sq. mi.)	Population (1951 est.)
French protectorate	153,870	8,500,000
Spanish protectorate	17,631	1,200,000
Places of Spanish sovereignty*	823	185,000
Tangier	232	172,000
Total	172,556	10,057,000

*Alhucemas, Ceuta, Chafarinas, Melilla, Peñón de Velez and the Ifni territory (741 sq.mi.).

French protectorate pop.: (1949 est.) 9,200,000, mostly Arabs and Berbers who are Moslem and speak Arabic (64%) or Berber (22%) or are bilingual (14%); (1947 census) Europeans 325,000, including 266,133 French; Jews 225,000. Chief towns (pop. 1947 census): Rabat (cap., 161,416); Casablanca (511,222); Marrakesh (238,277); Fez (200,946); Meknès (159,811). Ruler, Sultan Sidi Mohammed ben Youssef III; grand vizier, Hadj Mohammed el-Mokri; French resident general in 1952, Gen. Augustin Guillaume.

History.—On March 14, 1952, the sultan asked the French government to revise the protectorate statute, to set up a new Moroccan government in order that the appropriate negotiations could be pursued, and to grant certain freedoms (notably to form trade unions). The French government's answer (Sept. 17) was to suggest that the political transformation should begin with fundamental democratic reforms: councils elected in the rural areas and Franco-Moroccan commissions in the urban communities having European residents. In October the sultan made the dispute public by announcing that the French proposals would lead to a division of sovereignty in Morocco. The Quai d'Orsay rejected this interpretation. In the council of government the three electoral colleges assured the resident general of their desire to co-operate. The Arab states and certain Asiatic governments made further complaints to the United Nations about the Moroccan situation.

On Aug. 27 the International Court of Justice at The Hague, in judgment on a dispute between France and the United States, ruled that the maintenance of control over U.S. imports, while French imports were exempt, was illegal and further that account was to be taken of the value of imports in their country of origin as well as the value in Morocco. On the other hand it decided that U.S. citizens should be subject to local law except

FANTASIA at an annual festival in the holy city of Moulay Idris, French Morocco, one of the Arab customs which made for Moroccan nationalism and renewed demands for home rule in 1952

where their consuls had jurisdiction.

The building of air bases for the U.S. went on at Nouasseur (near Casablanca), at Boulhaut, at Sidi Slimane and at Beniguérir. The four-year plan, of which France was to pay half the cost, envisaged considerable undertakings: the development of mineral and food resources and of housing as well as health and educational projects. The overdevelopment of the oil and preserved-food industries was followed by a slowing down of investments. Tourist traffic brought the country 16,000,000,000 fr. (including 13,000,000,000 fr. from French visitors). The harvest was good, and it was possible to increase the budget without further taxation, as surplus revenue alone was enough. (See also UNITED NATIONS.)

Education.—(1951) Pupils 250,000 (including 75,000 Europeans).

Finance and Banking.—Note circulation 41,000,000 fr. Bank deposits 90,000,000 fr. Monetary unit: Moroccan franc=metropolitan franc=.2857 U.S. (1952).

Foreign Trade.—(1951) Imports 159,000,000,000 fr. (including 101,000,000,000 fr. from the French union and 13,000,000,000 fr. from the U.S.); exports 86,000,000,000 fr. (including 45,000,000,000 fr. to the French union and 12,000,000,000 fr. to Great Britain), mainly phosphates (16,877,000,000 fr.), cereals (10,800,000,000 fr.), preserved fish (7,500,000,000 fr.), manganese (3,900,000,000 fr.), citrus fruits (3,600,000,000 fr.), lead (2,800,000,000 fr.).

Transport and Communications.—(1951) Motor vehicles 63,500. Cargo handled (port of Casablanca) 7,800,000 metric tons.

Industry.—Products (metric tons, 1951): phosphates 4,200,000; iron 1,500,000; manganese 333,000; lead 81,000; coal 393,000; gasoline 75,000; cement 376,000; fish 83,000. Electricity: 600,000,000 kw.hr. (HU. DE.)

Moscow. Capital of the Union of Soviet Socialist Republics and of the Russian Soviet Federated Socialist Republic, Moscow was in 1952 probably the third largest city of the world. Area (1939): 110.1 sq.mi. Pop.: (1939 census) 4,137,018; (1950 est.) 7,000,000.

Among the public buildings completed during 1952 were the Moscow State university in the Lenin hills, with accommodation for 6,000 students; 27 schools of standard pattern, each planned

for 880 pupils; and the Sovietskaya hotel, whose first guests were delegates to the Economic conference in April. A 32-story block of 700 family flats overlooking the Moskva river was the biggest to be completed during the year. Even so, building failed to keep pace with the demand for homes, and Moscow newspapers were outspokenly critical of out-of-date building methods. Four new stations on the Metro, Moscow's underground railway, brought the total length to 35 mi. and the number of stations to 39.

A long-term program for beautifying the city provided for the planting during 1952 of about 250,000 trees and 1,500,000 shrubs: the effect was most notable in the gardens of the new state university and the new schools, at the Stalin Motor works, the Kirov Dynamo works and the Byelorussia railway station.

The U.S. embassy moved from the building in Mokhovaya street, which had been its home since diplomatic relations were established in 1933, on the expiration of the lease on Dec. 31. New travel restrictions imposed on foreigners during the year affected chiefly the staff of diplomatic missions, and reduced the radius of unsupervised travel from Moscow from approximately 30 mi. to 25 mi. (C. Ry.)

Mossadegh, Mohammed (1880–), Iranian statesman, was born at Tehran, the son of Mirza Hedayat, for 30 years minister of finance. He served his apprenticeship as financial agent in the province of Khurasan. He soon opposed Mohammed Ali, the last shah of the Kajar dynasty, had to leave the country and studied in Paris and later at the University of Neuchâtel, Switz. After his return to Persia he was for a short period minister of justice (1920), of finance (1921) and of foreign affairs (1922), but was not popular with Persian officialdom because he insisted on cutting salaries and dismissing useless officeholders. During 1923–27 he was member of the *majlis* for Tehran, but had to retire from public life because of his opposition to Riza Khan Pahlavi who in Dec. 1925 was proclaimed new shah of Iran, with right of succession to his heirs. Mossadegh returned to politics in 1944, was elected to the *majlis* and put through a bill forbidding the government to grant an oil concession to anyone without legislative permission. As leader of the small National Front party (with 8 seats out of 136) he succeeded in persuading the

majlis to reject on Nov. 26, 1950, the supplementary oil agreement signed by the government with the Anglo-Iranian Oil company. On March 15, 1951, mainly under his pressure, the *majlis* passed the Oil Nationalization act. On April 28 Mossadegh was elected prime minister with the purpose of enforcing the act. On Oct. 8 he arrived in New York city to present Iran's case before the U.N. Security council. On Oct. 23 he visited Pres. Harry S. Truman in Washington and remained for a week in the U.S. capital. On June 9, 1952, he personally asked the International Court of Justice at The Hague to declare the A.I.O.C. dispute outside its jurisdiction. He resigned on July 16 but returned to power six days later. (See also IRAN.)

Motels: see TOURIST TRAVEL.

Motion Pictures. The U.S. motion-picture industry continued during 1952 to recover from the adverse effects of television, and gross box-office receipts for the year were estimated at \$1,225,000,000 as compared with \$1,166,000,000 in 1951. At least three factors contributed to the industry's revival: record foreign income, continued growth of the outdoor drive-in theatre and a greater variety and somewhat improved quality of pictures released by Hollywood.

Major producers estimated that foreign income for 1952 would exceed \$165,000,000, an increase over the previous high record of \$160,000,000 set in 1951. Canada alone accounted for almost \$100,000,000 of the 1952 gross receipts.

By June 1952 the drive-in theatres had increased in number from 820 in 1948 to 3,483 (including Canada). These new outdoor theatres had more than offset the closing of 1,500 mostly obsolete "indoor" theatres during the period 1948-52 and by the end of that period were accounting for approximately 20% of gross motion-picture theatre receipts in the United States and Canada. One of the leading reasons for the popularity of the drive-ins was their solution of the "baby-sitting" problem for parents. In June 1952, nevertheless, there were still 15,950 permanent motion-picture theatres operating in the United States.

Picture Trends.—The old-fashioned western pictures, once the staple product of the U.S. motion-picture industry, continued to decline in popularity in 1952. More topical films took their place. Once again Hollywood stressed the military services, with about 25 movies on the subject. Biographical films were also produced in quantity, with 30 either released or in production at the end of the year; of these, 12 were in the musical category. Historical events were dramatized in a number of pictures, such as the voyage of the "Mayflower" (*Plymouth Adventure*) and the German siege of Tobruk in World War II (*Desert Rats*). The story of a U.S. weather mission to the Gobi desert in Outer Mongolia during the early years of World War II was effectively told in *Destination Gobi*.

Improved summer business in 1952 resulted from the generally better quality of films released during the summer months. Of the 78 features released during June, July and August, 20 were considered "hits." The three top-grossing pictures of the summer period were Cecil B. De Mille's circus picture, *The Greatest Show on Earth*, the Dean Martin and Jerry Lewis comedy, *Jumping Jacks*, and the English *Tales of Hoffmann*, a Technicolor adaptation of Jacques Offenbach's opera. Together these three pictures did about 20% better at the box office than did the three top films of the 1951 summer season—*Show Boat*, *That's My Boy* (also a Martin-Lewis comedy) and *Alice in Wonderland*.

Samuel Goldwyn released his \$4,000,000 Technicolor *Hans Christian Andersen*, starring Danny Kaye, in Nov. 1952; it broke a 16-year gross-receipts record at the Criterion theatre in

New York city during its first week of showing.

Cinerama, the new three-dimensional motion picture, made its successful debut in New York city Sept. 30, 1952. A Technicolor film entitled *This Is Cinerama*, it was projected on a curved screen 65 ft. wide and consisted of a series of short subjects, including a frighteningly realistic ride on a roller coaster and a scene from the opera *Aida* staged at La Scala in Milan, It. Another three-dimensional process, known as Natural Vision, made its first appearance in *Bwana Devil* at Los Angeles, Calif., in December. By the end of 1952 there were 19 U.S. companies working on three-dimensional processes, some (like Cinerama) not requiring the audience to wear special polaroid glasses.

Italian Film Festival.—Italian film producers gained the national motion-picture spotlight in Oct. 1952 when the Salute to Italian Films week was held in New York city. This festival, first of its kind in the United States, pointed up the growing market for European films in the western hemisphere. Seven outstanding Italian films produced since the end of World War II were previewed at the festival.

Stars of Tomorrow.—Marilyn Monroe won first place in the *Motion Picture Herald's* 12th annual "stars of tomorrow" poll of U.S. motion-picture theatre owners. Others named in order were Debbie Reynolds, Marge and Gower Champion, Mitzi Gaynor, Kim Hunter, Rock Hudson, Audie Murphy, David Wayne, Forrest Tucker and Danny Thomas.

Legal Actions.—The U.S. supreme court ruled 9 to 0 in May 1952 that U.S. cities and states cannot censor or bar motion pictures on the grounds that they are sacrilegious (the picture in question was the Italian film *The Miracle*, which had been banned in New York state). The supreme court held that motion pictures come under the freedom-of-speech provisions of the U.S. constitution.

The U.S. department of justice announced later during the year that it would bring action against major film producers to force them to release 16-mm. prints of superior movies to television companies and advertisers.

Statistics.—The U.S. department of commerce reported that there were 14,900 companies in the motion-picture industry of the U.S. at the end of the first quarter of 1952—unchanged since Sept. 1951. There were 647 theatre circuits, each with four or more theatres, operating 51% of the total number of theatres, with 64.1% of the total number of seats. Approximately 6,795 companies or individuals operated the remaining 49% of the theatres with 35.9% of the seating capacity. Gross refreshment sales in both indoor and outdoor theatres were estimated at \$400,000,000 annually in 1952 (an average of 6 cents per patron for indoor theatres and 20 cents for outdoor). The average price of admission, including taxes, was estimated at 47 cents in 1952 compared with 44 cents in 1948.

Production investment of all types in 1951 was estimated at more than \$500,000,000, and the average cost of production was about \$900,000. Corporate sales of the industry in that year amounted to \$1,813,000,000. Federal tax collections for the fiscal year ending June 30, 1952, totalled \$328,610,530, compared with \$346,491,715 for the preceding fiscal year.

Academy Awards.—The Academy of Motion Pictures Arts and Sciences announced in March 1952 the following awards for 1951:

BEST PICTURE.—*An American in Paris*, MGM, produced by Arthur Freed.

BEST PERFORMANCES.—Actor: Humphrey Bogart in *The African Queen*, Horizon Enterprises, Inc., United Artists. Actress: Vivien Leigh in *A Streetcar Named Desire*, Charles K. Feldman Group Productions, Warner Brothers. Supporting actor: Karl Malden in *A Streetcar Named Desire*, Charles K. Feldman Group Productions, Warner Brothers. Supporting actress: Kim Hunter in *A Streetcar Named Desire*, Charles K. Feldman Group Productions, Warner Brothers.

BEST DIRECTION.—George Stevens, *A Place in the Sun*, Paramount.

BEST WRITING.—Story: Paul Dehn and James Bernard, *Seven Days to*

Voon, Boulting Brothers, Mayer-Kingsley, Distinguished Films (British). Screenplay: Michael Wilson and Harry Brown, *A Place in the Sun*, Paramount. Story and screenplay: Alan Jay Lerner, *An American in Paris*, MGM.

BEST ART DIRECTION.—Black and white: Richard Day, *A Streetcar Named Desire*, Warner Brothers. Colour: Cedric Gibbons and Preston Ames, *An American in Paris*, MGM.

BEST CINEMATOGRAPHY.—Black and white: William C. Mellor, *A Place in the Sun*, Paramount. Colour: Alfred Gilks, *An American in Paris*, ballet photographed by John Alton.

BEST COSTUME DESIGNS.—Black and white: Edith Head, *A Place in the Sun*, Paramount. Colour: Orry Kelly, Walter Plunkett and Irene Sharaff, *An American in Paris*, MGM.

BEST FILM EDITING.—William Hornbeck, *A Place in the Sun*, Paramount.

BEST SOUND.—Douglas Shearer, sound director, *The Great Caruso*, MGM.

BEST MUSICAL ACHIEVEMENT.—Scoring of a musical: *An American in Paris*, MGM, by Saul Chaplin and Johnny Green. Dramatic or comedy film score: *A Place in the Sun*, Paramount, by Franz Waxman. Song: "In the Cool Cool Cool of the Evening," from *Here Comes the Groom*, Paramount, music by Hoagy Carmichael, lyrics by Johnny Mercer.

BEST SHORT SUBJECTS.—Cartoon: *Two Mouseketeers*, MGM, Fred Quimby, producer. One-reel: *World of Kids*, Warner Brothers, Robert Youngson, producer. Two-reel: *Nature's Half Acre*, Walt Disney Production, RKO Pictures.

BEST DOCUMENTARIES.—Short subjects: *Benjy*, made by Fred Zinnemann with the co-operation of Paramount for the Los Angeles Orthopedic hospital. Feature: *Kon-Tiki*, Artfilm Production, RKO Pictures (Norwegian), Olle Nordemar, producer, film presented by Sol Lesser.

SPECIAL AWARDS.—Irving G. Thalberg memorial award, to Arthur Freed. Best foreign film: *Rashomon* (Japanese), RKO Pictures. George Pal for extraordinary special effects in his film, *When Worlds Collide*. Gene Kelly for his ability to put choreography on film. (S. L.R.; X.)

Educational Motion Pictures.—The increasing use of motion-picture film for purposes other than entertainment was keeping pace during 1952 with the mounting totals of 16-mm. sound projection equipment sales to the specific fields in which these films were used.

Leading all these fields, both as a user of 16-mm. equipment and as a purchaser of original film production, was U.S. business. Equipment manufacturers reported that more than half of their professional sales were to business and industry sources; 143 producers of business-sponsored films reported gross production sales of \$45,000,000 in 1952. These figures reflect only the domestic, civilian usage of films for communication; military procurement of training films and projection equipment continued through 1952 to be one of the major factors within the production and manufacturing segments of the industry.

One measure of the value placed on such audio-visual tools by the U.S. military establishment was revealed by Maj. Gen. George I. Back, chief signal officer of the army, who said, in addressing the Society of Motion Picture and Television Engineers in October, that "70,000,000 man hours of training are accomplished annually (in the army) through the use of training films." About 80% of the navy's film requirements were being met in 1952 by civilian film producers under contract.

By the last quarter of 1952, nearly all the secondary schools in the U.S. had at least one 16-mm. sound projector in each school building; the large and medium-sized urban school systems reported large numbers of 16-mm. sound projectors in their elementary schools. Rural schools, moving toward consolidation, were also becoming a potential classroom film market.

Church and parochial projector ownership, spurred by the activities of co-operative film production by interdenominational groups such as the Protestant Film commission, by denominational sponsorship and by the growth of professional groups such as the Visual Education Fellowship in the National Council of Churches and the Religious Film association, was fast becoming a major user of nontheatrical motion pictures. Protestant church projection equipment was estimated to exceed 50,000 machines during the year.

The formation during the year of the Catholic Audio-Visual association, which held its first annual meeting in Chicago, Ill., in August, gave evidence of the increasing parochial use of films. Widespread interest in basic moral concepts presented in films was aroused by the film contributions of the Christophers, founded by a Maryknoll priest, Jesuit Father James Keller,

MEL FERRER (left) and Stewart Granger in a flamboyant dueling scene from *Scaramouche*, a 1952 production in Technicolor

and by the tolerance films of the Anti-Defamation league of the B'nai B'rith. The league's *The Challenge* and *The High Wall* were accorded high honours in various film festivals. Within a few months of its completion, more than 1,000 prints of the Christophers' *Government Is Your Business* were used by community organizations, industrial firms and church groups of all denominations, particularly in the period leading up to the presidential election.

Twenty-three producing companies were listed as classroom motion-picture and filmstrip producers, though many of these companies also produced films for community and industrial uses. A conservative estimate of their gross sales of 16-mm. prints to schools and organizations approximated \$6,000,000 for the year. Leading companies, from the standpoint of film production budget and sales, were Coronet Films, Encyclopaedia Britannica Films (also the oldest), the Text-Film division of McGraw-Hill, Young America Films and United World. Foreign film information programs, sponsored in the U.S. by such bureaus as the British Information services, the National Film Board of Canada and Films of the Nations accounted for another large share of the 16-mm. films going to schools and community groups.

Though business, schools and churches were the largest "vertical" markets for film production and print purchases, several other fields were active users of films. The Committee on Medical Motion Pictures of the American Medical association maintained liaison with all professional groups interested in medical films, and reported large concentrations of 16-mm. equipment in U.S. hospitals and medical schools. The production of medical films for professional use was aided by grants and contracts from foundations, medical societies and pharmaceutical companies.

Specialized film application was taking place in such diverse fields as industrial research, motion and time study, management engineering, document reproduction and specialized training. U.S. pre-eminence in these fields was reflected by the constant flow of original films to other countries where translated versions were being used. Agricultural methods, preserved on numerous department of agriculture and privately sponsored films, was another U.S. contribution to overseas technical information programs. Audio-visual consultants were sent on loan

to nearly all the Marshall plan countries.

The value of educational motion pictures to the lay public was shown in 1952 by the American Cancer society's series on cancer. *Breast Self-Examination*, a film for women's groups, was exhibited to thousands of audiences during the year under business, professional and community sponsorship.

Traffic safety education was another major area of film production and widespread showing. Productions such as *Drug Addiction*, sponsored by the Wieboldt foundation, and *Alcoholism* made major contributions to public education. These two films typified Encyclopaedia Britannica Films' broader involvement in the field of adult education.

Business and labour groups were large contributors to the film lists of the year and some of these were in the common area of labour-management relations. Approximately 1,600 firms were listed during the year as providing film programs for employees during noon-hour and between-shift periods.

The largest national distributor of sponsored motion-picture programs reported a 47.3% increase in advance booking requests for nearly all of the 117 motion pictures in its promotional lists.

Professional organizations active in the 16-mm. field included the National Audio-Visual association, the Educational Film Library association, the Industrial Audio-Visual association, Biological Film Producers, University Film Producers, Film Producers Association of New York City, and the Film Council of America. (O. H. C.)

Technical Developments.—*Theatre Television.*—The first transcontinental theatre televising in history occurred on Sept. 23, 1952, when the Jersey Joe Walcott-Rocky Marciano heavyweight title boxing match was fed exclusively to 50 theatres in 30 cities in the United States. The event took place in Philadelphia, Pa., and was seen in theatres from New York to California. Technically the results were very satisfactory, although momentary interruptions occurred in some instances.

Eidophor.—Eidophor, a new, large-screen, theatre colour television system, received its first public demonstration in June by 20th Century-Fox. The demonstration consisted of a live pickup from a stage a few blocks from the theatre, transmitted by closed circuit to the Eidophor projector located in a standard theatre booth. The Eidophor receives a black-and-white or colour television signal which is employed to modulate the light from an arc-lamp projector, resulting in relatively high levels of illumination on the theatre screen. For colour, the system employs rotating filters similar to the Columbia Broadcasting system colour television system.

Cinerama.—Cinerama, which opened its first commercial showing in New York city in October, presented an image three times as wide as the ordinary picture and half again as high. In photography, three special cameras are used, each simultaneously photographing one-third of the total picture. In projection, three projectors are employed, each of which projects the picture photographed by its camera. The first release featured outdoor sequences, but the process had not yet been tried for a dramatic picture.

Cinerama gives a three-dimensional illusion and a feeling of actual participation in the action on the screen. However, it presented problems both in production and exhibition, particularly in the requirement for three special projection booths and the fact that only specially shaped auditoriums could be used.

"Natural Vision."—The first feature-length third-dimensional motion picture was released in November in Los Angeles, Calif. While stereoscopic short subjects and training films had previously been made, this was the first full-length—approximately 9,000 ft.—motion picture of an entertainment nature to be re-

leased. The picture, made by Arch Oboler Productions with Natural Vision corporation's equipment and technical supervision, used the polaroid method of projection and viewing. This method photographs two pictures simultaneously, or nearly so, in such a manner as to correspond to the two views of the same scene that would be seen by the two eyes of an observer were he in the camera's position. These two pictures, called stereoscopic pairs, must then be projected so that the right-eye picture is seen only by the right eye, and the left-eye picture is seen only by the left eye. The separation of pictures is obtained by projecting through polaroid filters onto an aluminized screen and is viewed through eyeglasses which also contain polaroid filters.

The Natural Vision corporation actually employed no new principles, but had designed and developed a convenient mount for two standard motion-picture cameras so that focus and convergence could be controlled conveniently and simply.

Vistascope.—A new device for producing composite motion pictures, which was developed in France and brought to the United States, had been perfected to a point where it was ready for production use in motion pictures and television. The Vistascope is a boxlike device placed between the camera and the action so that the camera can photograph the action seen in conjunction with a superimposed foreground or background setting. This setting is usually in the form of a still photograph with cutout areas in those portions which are to be occupied by the action. The Vistascope possesses the advantage common to other methods of composite photography in being capable of bringing distant locations into the studio, thus making it unnecessary for the cast to be photographed in the actual location.

Background Process Screens.—The Motion Picture Research council, after two years' collaboration with Roy Stewart and Sons, developed the first mechanical method of process screen fabrication. Previously these screens were produced by hand-spraying methods where quality and reproducibility were dependent upon the skill of the operator. A background process screen is translucent, with the picture being projected on the screen from the opposite side to which it is viewed or photographed. It is used to combine projected backgrounds, from either still or motion pictures, with action which takes place in front of the screen. The camera photographs the background and the action simultaneously on one negative.

The background process screen method differs from the Vistascope in that the action can take place or move about as long as it stays within the camera's view, while in Vistascope the action cannot move across the cutout areas in the photograph.

(W. F. Kv.)

Canada.—After confirming reports that a site had been purchased in Ville St. Laurent on the outskirts of Montreal for a new building to house the National Film board, the federal resources department minister, R. H. Winters, announced that a committee of parliament would consider the annual report of the board. However, by October no formal statement had been made by the committee upon the board's activities, though during the parliamentary debate setting up the committee there was general recognition that the board had made progress since it had been reorganized in 1950.

In April the Canadian film awards for films of 1951 were made public. Of the more than 50 films entered, the results were: best documentary short, *Newfoundland Scene* by Crawley Films, Ottawa, with honourable mentions to the National Film board's *The Longhouse People* and *Les Moines de St. Benoit du Lac*; theatrical features, *Royal Journey* by the National Film board, with honourable mention to the board's *Le Petite Aurore*; theatrical shorts, *Opera School* by the National Film board,

with honourable mention to *Fruitful Earth* by Associated Screen
Jews of Montreal; government-sponsored documentary short,
Milk Made by the National Film board, with honourable men-
tion to *Ski à Québec* by Laval university; nongovernment-spon-
sored documentary short, *Packaged Power* by Crawley Films.

Figures released in Oct. 1952 by the federal bureau of sta-
tics revealed that in 1951 Canadians spent \$96,319,583 in
1952, 159,125 paid admissions to the movies; in 1950, \$86,713,357
or 242,396,679 admissions. (C. Cy.)

In Canada, film production during 1951-52 amounted to 213
subjects, and the nontheatrical audience was nearly 11,500,000.
Most of the films were for specialized educational use.

European Film Festivals.—In 1952, as in previous years, a
number of film festivals were organized; the chief in western
Europe were at Cannes, Fr., Berlin, Ger., Venice, It., and
Edinburgh, Scot. The Communist countries held their festival
at Karlovy Vary, Czech., where the soviet film *The Unfor-
gettable Year 1919* won the Grand Prix. At Cannes the main
awards went to Renato Castellani for *Due Soldi di Speranza*
and to Orson Welles for *Othello*; both shared the Grand Prix.
At Venice the premier award went to René Clément for *Jeux
interdits*. Berlin and Edinburgh were both organized as non-
competitive festivals.

Great Britain.—The three groups originated by the National
Film Finance corporation (British Film Makers Ltd. at Pine-
wood, the Elstree group and the pioneer Group Three), together
with London Films and Ealing studios, accounted for most of
the first feature product on which the general reputation of
British films was based.

The British Film Production fund (also known as the Eady
fund) operated well, although it was subjected to considerable
criticism by the exhibitors through whom the money for it was
collected. Producers received approximately 40% of the box-
office returns on their films in the form of a quarterly bonus,
the sum varying in proportion to the number of applicants
drawing on the fund. Without a scheme equivalent to the Eady
plan, the average British film could only be expected to regain
33% of its cost at the British box office; with the plan there
was hope that producers could retrieve 106%, and eventually
even 115%.

British documentary work during 1952 received a severe blow
when the government announced that the Crown Film unit and
the Mobile Film Exhibition units initiated during World War II
and later maintained by the Central Office of Information would
be disbanded at the end of March.

Little progress was made in the problems affecting the film
industry and television. The British Broadcasting corporation
maintained its own production unit for newsreels, special docu-
mentaries for television screening and film inserts for use in
various otherwise "live" programs. The Telekinema was re-
named the National Film theatre and reopened by the British
film institute in the autumn to show specialized programs to
the institute's members and to the public.

The chief British feature film productions of the year in-
cluded *The Sound Barrier* (David Lean), *The Importance of
Being Earnest* (Anthony Asquith), *Cry the Beloved Country*
(Zoltan Korda), *Angels One-Five* (George More O'Ferrall), *I
Believe in You* (Michael Relph and Basil Dearden), *Mandy*
(Alexander MacKendrick), *Murder in the Cathedral* (George
Hoellering and T. S. Eliot), *Outcast of the Islands* (Carol
Reed) and *Secret People* (Thorold Dickinson).

Commonwealth.—The output of the Indian film industry
had become since World War II second only to that of Holly-
wood. Production was by about 400 individual companies, work-
ing in 67 studios, centred mostly in Bombay, Madras and Cal-
cutta. The average annual output of feature films had been 250.

HANS HASS, camera in hand, studying a rare coral formation 100 ft. below
the surface of the Red sea off Port Sudan. A cinematic record of the sights
and sounds of submarine life, titled *Under the Red Sea*, was released in
1952, filmed by an expedition led by Hass

The main countries which imported Indian films were Pakistan
(chief importer), Burma, Ceylon and Malaya. Few Indian films
had been shown as yet in the theatres of Europe and America,
though Chetan Anand's film *Neecha Nagar* won the Grand Prix
at the Cannes festival in 1946 and Uday Shankar's *Kalpana* was
widely appreciated for its presentation of Indian dancing. *Aan*,
India's first colour film, was shown in London in 1952. An in-
ternational noncompetitive festival of films was held in India
early in 1952: it was organized first in Bombay and afterward
in Madras, Delhi and Calcutta. Twenty-three countries, includ-
ing the U.S.S.R., submitted films.

France.—Production in France, as in Great Britain, contin-
ued in 1952 to depend on the amount of screen space French
films could command in their own country in the face of foreign
competition, particularly from the U.S. During 1950-51, 23
Franco-Italian co-productions were made. Co-production was
authorized officially by the French Centre National de la Ciné-
matographie and the Italian Direzione dello Spettacolo. These
co-productions enjoyed unrestricted entry to the markets of
both countries and in certain cases had quota privilege. An ex-
ample of co-production with Great Britain was the full-length
cartoon by the company known as les Gêmeaux: *La Bergère
et le Ramoneur*.

Jean Renoir, whose *The River* was an Anglo-U.S. production
made in India, continued to work outside France, whereas Max
Ophüls, the distinguished Austrian film maker, had recently
joined the French studios. French films had once more become
consistent award winners at the more important international
festivals, and although the finer French productions presented
dark and morbid themes, sensitivity in the handling of difficult
social and psychological situations had become characteristic of
the outstanding newer directors such as Robert Bresson, René
Clément and André Cayatte.

Important films made during 1952 included *Nous sommes*

CHARLIE CHAPLIN directing Melissa Hayden in a ballet sequence during the filming of *Limelight*, a 1952 opening. André Eglevsky stood by, watching Chaplin execute a pirouette

Tous des Assassins (Cayatte), *La Jeune Folle* (Yves Allégret), *Casque d'Or* (Jacques Becker), *Jeux Interdits* (Clément), *La Bergère et Le Ramoneur* (les Gémeaux) and *Les Belles de Nuit* (René Clair).

Germany and Austria.—The greater part of the 350 films produced in western Germany during 1945–52 (82 during 1951) were conventional dramas, comedies and musicals, and very few of them earned international acclaim. Producers continued to complain of the heavy taxation placed on the industry.

Austrian films were also forced to concentrate on conventional subjects, and became wholly dependent on export to meet production costs. Production of feature films reached 28 in 1951. More recent titles included *Eroica* (about Beethoven), *Vagabonds* and *She-Devil* (both based on plays) and *Under the Red Sea*, a feature-length documentary by Hans Haas about an underwater expedition. The veteran Austrian film maker G. W. Pabst was occupied during 1952 in making *The Voice of Silence* in Italy. There was also in Austria a considerable production of documentary, instructional and advertising films.

Italy.—The development of the Italian film industry had been a most striking post-World War II feature. The policy of the industry, operating under the official guidance of the Direzione dello Spettacolo, was to consolidate a world market with the aid of expert publicity handled by Unitalia, the organization representing the various production interests. Unitalia initiated during 1952 a series of Italian film weeks in a number of places, including London, New York and Madrid. Production figures for 1951 showed 98 Italian feature films completed. A coproduction agreement between Germany and Italy was completed in 1952, while the United States continued to produce films in Italy following *Quo Vadis?* which was first shown in Britain in 1952. The production of short films for 1951 numbered 306.

During 1951 the number of film theatres operating in Italy was 8,625, with a weekly average attendance of more than 13,000,000; a rise of both these figures was expected for 1952.

Notable productions in 1952 included *Umberto D* (Vittorio de Sica), *Olden Times* (Alessandro Blasetti), *The Girls of the Piazza di Spagna* (Luciano Emmer), *Europa '51* (Roberto Rossellini), *The White Sheik* (Federico Fellini), *Wife for a Night* (Mario Camerini), *Due Soldi di Speranza* (Renato Castellani), *Bellissima* (Luchino Visconti) and *Il Cappotto* (Alberto Lattuada). Outstanding among documentary films was *Leonardo da Vinci*, made by Luciano Emmer and based on Leonardo's drawings.

U.S.S.R. and Eastern Europe.—The chief soviet productions released in 1952 were *The Unforgettable Year 1919* (directed by M. Chiaureli), *Country Doctor* (S. Gerasimov) and, in the series of biographical films in which soviet directors had specialized during recent years, *Przhevalski* (the career of the 19th-century Russian explorer, directed by S. Yutkevich) and *Taras Shevchenko* (the Ukrainian poet and national hero). V. I. Pudovkin's contribution to soviet motion pictures was *Harvest*, about rural socialization, and G. V. Alexandrov made a film about the Russian composer, M. I. Glinka. Other films were *Cavalier of the Golden Star* (Y. Y. Raizman) and *Donets Miners* (L. D. Lukov). Many scientific and documentary films were awarded Stalin prizes and work in cartoon films was widely developed, chiefly for child audiences. Almost all soviet films were made in colour.

The main centre of the Polish film industry was at Lodz, where, in addition to studios, a training establishment for film makers had been set up with a five-year course of study. Outstanding productions were *The Young Chopin*, directed by Alexander Ford, *The Crew* (Jan Fetke), about sea cadets, and *First Days* (Jan Rybkowski), which dealt with the postwar reconstruction of a steel mill.

The Hungarian film industry, nationalized in 1948, also concentrated on social subjects, *Strange Marriage*, a colour film satirizing the hierarchy of the Roman Catholic Church; and a film of historical reconstruction, *Madame Dery*, dealing with the movement for liberation from the Austrian regime. Production in Bulgaria had also been nationalized in 1948 and similar social subjects were presented in *Alarm*, *Danka* (the struggle of the textile workers under capitalism) and *Dawn over the Land* (about the Bulgarian Communist youth movement). Rumania began to develop film making with productions like *Life Triumphant*, about the socialization of the scientists, and *Mitrea Cocor*, about a Rumanian peasant who deserted the fascist army to join the Communists.

In eastern Germany production was centred on the Deutsche Filmgesellschaft (D.E.F.A.) studios in Berlin, where Wolfgang Staudte made *The Subject*, based on Heinrich Mann's novel. A recent biographical film was *Wilhelm Pieck. Women's Lives* (directed by Slatan Dudow) dealt with the problems of women in contemporary Germany. Criticism of Allied administration in the west was the subject of *The Condemned Village*, the story of a German village evacuated to make a U.S. military air base; and *Shadow over the Islands*, the story of a doctor's fight for the health of the people in the Faroe Islands.

Yugoslavia.—During 1952 Yugoslavia continued to develop its technical resources and to train film technicians during the actual process of production. Among films released was Vjekoslav Afric's third film, *Hoja Lero*, a fantasy set in an imaginary land of the 7th century. A Slovene folk tale was made into the film *Kekac. The Chronicles of Visoko* was derived from a historical novel by the Slovene writer Ivan Tavcar and directed by Bojan Stupica; its action took place during the Reformation in Slovenia. (See also LAW.) (R. MAN.)

Motor-Boat Racing. In early summer of 1952 it was announced that the holder of the record for the fastest mile ever travelled in an auto, John Cobb of London, Eng., was constructing a jet-powered boat with which he hoped to boost the 160.3235 m.p.h. water speed record held by Stanley Sayres' "Slo-Mo-Shun IV" of Seattle, Wash. Cobb's task was made no easier when, on July 7, Sayres drove his Allison-powered record-holder to a new mark of 178.497 m.p.h.

After weeks of preliminary trials on Scotland's Loch Ness, Cobb decided to make his bid on the morning of Sept. 29. His first run over the mile turned out to be the fastest, by far, that man had ever travelled on water, as timers caught him at 206.89 m.p.h. But his boat "Crusader" never made the return run required by the rules. While roaring past the finish of the mile, it suddenly overturned in a great cloud of spray, and Cobb was killed.

The Gold cup race at Seattle, Wash., on Aug. 9, found defending champion Stanley Sayres pitting his "Slo-Mo-Shun IV" and "Slo-Mo-Shun V" against a field of four challengers. When mechanical mishaps prevented any of the six boats from finishing the full 90 mi. of the race, it was "Slo-Mo-Shun IV," driven by Stanley Dollar, Jr., which won the contest on points. Charles F. Thompson of Detroit, Mich., set a new 30-mi. record of 101.024 m.p.h. when he captured the first heat, driving "Miss Pepsi," the twin-engined craft owned by Roy and Walter Dossin, also of Detroit.

Winners of other American inboard racing classics were: Ford memorial (Detroit), "Miss Pepsi"; National sweepstakes (Red Bank, N.J.), "You All," owned and driven by Bob Rowland, Norfolk, Va.; President's cup (Washington, D.C.), "Miss Pepsi"; Silver cup (Detroit), "Gale II," owned by Joseph Schoenith, driven by Dan Foster, both of Detroit; Steel cup (Pittsburgh, Pa.), "Such Crust IV" representing the Detroit

team of owner Jack Schafer and driver Bill Cantrell.

In the outboard category Raymond Lenk of Highland Park, Mich., led 272 competitors home in the annual Winnebago land race which covers 92 mi. of Wisconsin's lakes and rivers. In the Albany-New York outboard marathon, down 130 mi. of the Hudson river, R. L. Switzer of McHenry, Ill., showed the way.

(W. M. CR.)

Motor Transportation. Motor transportation continued to play an increasingly large role in the lives of United States citizens during 1952. Ownership and operation of all types of highway transport—passenger cars, trucks and buses—reached new highs during the year. Total registrations by the end of the year were estimated to be in excess of 53,363,000 units, or 3% above the previous record mark established in 1951.

In the seven years since the end of World War II, 22,000,000 vehicles had been added to the nation's total motor fleet. Passenger cars accounted for nearly 44,000,000 units of the total, trucks for more than 9,000,000 and buses 235,000.

Production of new motor vehicles in 1952, however, showed a decline, as the nation's mobilization program required more and more of the supply of critical materials. Estimated production for the year totalled 5,500,000 units, or approximately 1,200,000 units below the 1951 output and more than 30% below the industry's peak output of 8,003,056 new cars, trucks and buses in 1950. Despite the sharp decline, 1952 output represented the fourth highest annual output in the industry's history.

Included in the year's production totals were 4,350,000 passenger cars and 1,150,000 trucks and buses. Approximately 200,000 units of the automobile output and 165,000 truck units were allocated by the industry to export markets. This represented a 23% decline from export shipments in 1951.

Wholesale value of 1952 motor vehicle production dropped 8% below 1951 to \$9,000,000,000. Replacement parts output, however, remained fairly constant with that of the preceding year, with wholesale value of such items estimated at \$2,500,000,000. (See AUTOMOBILE INDUSTRY.)

Total motor vehicle mileage in 1952 exceeded for the first time the 500,000,000,000-mi. mark. In rolling up this figure, U.S. motorists used more gasoline than they ever had before in a single year. As travel and congestion on the nation's highways and streets increased, so did accident and fatality totals reach new highs. More than 38,000 motorists and pedestrians were fatally injured in highway accidents in 1952. (See also ACCIDENT PREVENTION.)

A survey of automobile ownership and use revealed that nearly two-thirds of U.S. families owned an automobile. On an average winter day, about 70% of those U.S. citizens who used some form of transport to go to and from their work did so by motor cars. Passenger-car use for employment purposes was particularly heavy in the far west, where more than 90% of employed persons used some form of transport to get to work, with 81% of that total relying on passenger cars. In the east the number of persons using cars dropped to 58%.

Employment in highway transportation fields continued to grow in 1952, with the total topping 9,400,000 persons, or one out of every seven employed in the United States. Included were 900,000 persons employed in the manufacture of motor vehicles, parts and tires; 300,000 in the petroleum field; nearly 2,000,000 in sales and servicing; 330,000 in road building; 5,230,000 in trucking; 200,000 in bus transportation; 600,000 in such related fields as taxicab, insurance and finance.

Industry statisticians calculated that there were 693,000 automotive businesses in the United States, or that one out of every six business establishments in the country was automotive

in nature. These included automobile dealers, service garages, trucking firms, bus operators, tourist courts, gasoline stations, etc.

U.S. motor transportation continued to be taxed progressively higher year by year. In 1951, U.S. motorists paid a record total of \$4,700,000,000 into federal, state and local tax coffers. This was more than double the amount collected in 1941. These taxes were paid directly or indirectly by highway users. They included federal excise taxes, state gasoline taxes, registration fees, special city and county taxes on motor vehicles, and tolls.

Federal excise taxes added more than \$1,500,000,000 to the cost of automotive products during the year. State motor vehicle fees and gasoline taxes totalled nearly \$2,900,000,000, and state sales taxes on automotive products reached about \$387,000,000. Special truck taxes exceeded \$1,300,000,000. Approximately 32 cents out of the automobile sales dollar went for taxes. It was shown, for example, that taxes on a \$2,000 car delivered to a resident of Michigan totalled \$650.

The first automotive tax was a \$1 licence fee imposed by the state of New York in 1901. By 1911 all motor vehicle taxes in the U.S. totalled about \$4,000,000 annually. In 1921 the figure reached \$296,000,000; in 1931, almost \$1,000,000,000. It topped \$2,000,000,000 in 1941 and more than doubled in the next ten years. Since 1900 U.S. motorists and commercial motor vehicle operators had contributed an accumulative total of more than \$50,000,000,000 in special taxes.

With general taxes considered, as well as special automotive levies, it was estimated that at least one out of every eight tax dollars collected in the country originated from the use, manufacture and sale of motor vehicles or automotive equipment. The total was \$7,500,000,000 in 1950, latest year for which complete tax data were available.

A significant and encouraging move in the highway transportation field during 1952 was the establishment of what appeared to be a new "good roads movement" in the U.S. Representatives of 40 organizations interested in better roads met in Feb. 1952 at the invitation of the National Highway Users conference to see what could be done. P.A.R. (Project—Adequate Roads) resulted. The broad purposes of the P.A.R. program, as outlined by its founders, were to stimulate public awareness of highway needs and to unify the efforts of all groups working for good roads.

Since 1940 the number of motor vehicles registered in the country had increased about 60%, or from about 32,000,000 to more than 53,000,000. Meanwhile, total street and road mileage had grown but a small fraction of 1%; there had been only a 25% increase in surfaced rural road mileage; and annual highway expenditures actually were below the pre-World War II rate, after adjusting for higher costs.

P.A.R. listed the following as necessary elements in a sound national highway policy: (1) proper classification of roads into systems; (2) allocation of funds for adequate highway systems; (3) dedication of highway-use taxes to highway purposes; (4) fair distribution of highway costs; and (5) improved highway administration.

The program also urged that highway improvement be achieved "according to comprehensive scientific studies of needs." This would call for proper fiscal studies and the use of a sufficiency rating system for assessing the relative importance of various road needs. (See also ROADS AND HIGHWAYS.)

(H. A. Ws.)

Great Britain.—The Conservative government, elected in Oct. 1951, was pledged to return to private hands that section of the transport industry which had been acquired by the British Transport commission under the Transport act of 1947. Accordingly a white paper outlining the new government's pro-

posals was laid before parliament in May 1952.

The bill that followed the white paper appeared in July. Little in it met the criticisms of those who hoped for a broader approach to transport problems, and in the main the proposals of the white paper were reiterated and amplified. To protect the interests of the small hauler, transport units offered for sale were not in general to consist of more than 50 vehicles nor was the total unladen weight to exceed 200 tons. These limits were only to be exceeded with the approval of the minister of transport. At the other end of the scale, single vehicles could be disposed of as "transport units." Transport units thus sold were to carry with them the right to a five-year "A" licence, free of mileage restriction. Parallel to this provision the bill proposed that the 25-mi. limit applying to most of the existing "A" and "B" licence holders should be lifted when the minister was satisfied that no further sales of transport units could be made to the public. An annual levy of 13s. 6d. for each quarter of a ton unladen weight was to be made on all trucks weighing more than one ton. This levy to the total value of about £4,000,000 was to be used as part payment for the good will lost by the Transport commission with the sale of their vehicles and partly as compensation to the commission for the loss of rail traffic to the roads.

The Transport commission's accounts, published in June, showed that British road services had earned a surplus of £3,200,000 in 1951 compared with a deficit of £1,200,000 in 1950. The surplus was not significantly greater in proportion than the £1,400,000 earned in 1949 when the Road Haulage executive was much smaller and its gross receipts less than half of those in 1951. It also proved impossible for the 1951 standard of results to be maintained in 1952, and in October the minister of transport, A. T. Lennox-Boyd, announced that the Road Haulage executive was not paying its way.

The death of the king prevented the passage of the bill in the summer session of parliament and it was postponed to the autumn session.

Statistically the proportion of the road haulage industry in public ownership contrasted sharply with the volume of public and political interest. The Road Haulage executive was operating about 40,000 vehicles in 1951. In the middle of the year 40,000 haulers holding "A" and "B" licences were operating about 120,000 vehicles and "C" licence holders had about 820,000. The last figure was increasing at the rate of about 4,500 a month. Publicly owned road transport thus accounted for little more than 4% of total capacity. (W. J. HN.)

Municipal Government. A summary report on 1952 federal legislation affecting cities, issued by the Washington office of the American Municipal association, indicated the constantly expanding area of local government concern which was subject to congressional activity. It was estimated that of the total of 3,847 bills introduced in the 82nd congress, 2nd session, between 300 and 400, representing about 10%, related directly to cities, exclusive of those indirectly affecting cities. Legislation reflecting substantial gains to city governments, in some instances procured through the efforts of the association, included the following: extension of federal aid highway laws, with annual sums of \$137,500,000 reserved for urban projects in fiscal 1954 and 1955; exemption of municipal charges from price control; rent control legislation;

increased provision for defense area community facilities and services and for defense housing in critical areas; provision for payments on slum clearance projects as the work progressed rather than on its completion; extension until 1954 of the period during which city employees might join the federal social security system and a guarantee of full exploration early in 1953 of the extension of the system to employees not presently eligible; continuation of federal programs relating to airport development, hospital construction and school construction in federally affected defense areas.

Congress failed to act or acted inadequately on several matters directly affecting the cities. It failed to provide for a census of governments in 1952—authorized to be taken every five years by the preceding congress, and last taken in 1942—thereby postponing the next such census to 1957. It failed to act on bills to provide payments in lieu of taxes on federally owned real estate and on bills to establish a national commission to study federal-state-local relations. The public housing program, providing originally for 135,000 dwelling units each year and limited during fiscal 1952 to 50,000 units, was further reduced for fiscal 1953 to 35,000 units. Of the \$600,000,000 requested by congress for civil defense, only \$43,000,000 was voted; states and cities spent \$183,000,000 for this purpose in 1952 according to the first annual report of the Federal Civil Defense administration, and were expected to spend approximately \$60,000,000 in 1953; city expenditures for this purpose were running higher in 1952 than in 1951. (See also CIVIL DEFENSE, U.S.)

The proposed relaxation of the ban on the use of critical materials for municipal entertainment and recreational projects, scheduled for July 1, 1952, was deferred by the National Production authority because of the steel strike until early in 1953. The restraints on municipal borrowing imposed in 1951 under the voluntary credit restraint program were terminated by the president as of March 24, 1952.

Municipal Finance.—Cities in considerable number experienced serious financial difficulties in 1952. Budgets, taxes, debts and expenditures reached record high levels. Increased urban stipulations, migration of population to the suburbs in metropolitan areas, expanded municipal services, inflationary costs, higher average salaries and wages including pension costs and extension of fringe benefits such as shorter work weeks, more paid holidays and extended sick leave and vacation allowances made municipal personnel accounted in part for the increasing financial burden.

The most promising new source of local revenue, authorized in about 28 states, was the municipal income tax. According to the June 1952 issue of *Tax Policy*, 19 cities of more than 10,000 population—7 in Pennsylvania, 7 in Ohio, 4 in Kentucky, and Washington, D.C.—had income taxes in 1952. Of these Canaan and Warren, O., and Newport and Lexington, Ky., adopted such a tax in 1952. Income taxes were also adopted in 1952 in Akron, O., and St. Louis, Mo. Four Ohio cities with less than 10,000 population likewise adopted income taxes in 1952. As of Sept. 1, 1952, according to a report by the Pennsylvania bureau of municipal affairs, 282 Pennsylvania localities—199 school districts, 72 boroughs, 9 cities and 2 first-class townships—had imposed income taxes (except on corporate income, which was fixed by the state) under Pennsylvania's act 481, the most liberal of all grants of taxing powers by a state to its localities. This tax had brought about \$100,000,000 in additional local revenues since its enactment in 1947.

New York city continued its 3% sales tax in 1952 and adopted a motor vehicle use tax along with other local levies. Mississippi extended permission to tax sales, previously limited to cities of certain population sizes, to include cities in counties bordering

on the Gulf of Mexico. Syracuse, N.Y., adopted a 2% sales tax; in Monroe county, N.Y., which includes the city of Rochester, a sales tax became effective in Jan. 1952. Other cities imposing sales taxes in 1952 included: Tuscaloosa, Ala., Meridian, Miss., and Salinas, Calif., a state where more than 150 cities had sales taxes.

Statistics on government revenues in 1951, issued by the bureau of the census in Aug. 1952, showed substantial increases over 1950 for all levels of government. Among the local units cities had the largest increase, amounting to almost \$500,000,000 or 9%. The estimated total general revenue for cities in 1951 was \$5,834,000,000, compared with \$5,341,000,000 in 1950. Of the 1951 total, taxes comprised \$3,867,000,000 (property taxes amounting to \$2,938,000,000); fiscal aid from other governments totalled \$1,088,000,000; the remainder, \$878,000,000, came from charges and miscellaneous services, which showed the greatest relative increase for this period.

An analysis by the Municipal Finance Officers association of monthly and annual data compiled by *The Bond Buyer* revealed that for the first six months of 1952 municipal bond sales attained a record high totalling \$2,515,000,000, compared with \$1,510,000,000 and \$2,070,000,000 for the same period in 1951 and 1950, respectively. The June figure alone in 1952 was \$632,000,000, the highest on record. Bond approvals for June—\$301,000,000—also exceeded any other month except that of the November elections. This large increase in bond sales totals was attributed to greatly increased sales of refunding bonds and revenue bonds rather than to increased general obligation bond issues; the total of revenue bond financing for the six-month period was \$906,000,000—more than the total of such financing for any preceding 12-month period. By the end of August, according to *The Bond Buyer*, municipal bond sales totals had reached the record high of \$2,974,000,000, almost equalling total annual sales for either 1948 or 1949, and bond approvals had risen to \$819,000,000.

Prices for municipal bonds fluctuated notably during 1952. Bond yields, according to *The Bond Buyer's* index of 20 municipal bonds, declined from 2.11% on Jan. 3 to a low of 2.03% on May 1; on Sept. 18 it stood at 2.32%, the highest since Nov. 1948. The rise was attributed in part to the heavy volume of municipal debt and in part to the higher interest yields on federal government obligations.

Personnel.—The defense program occasioned by the Korean war produced a shortage of competent public personnel in some cities, where there was a lack of candidates with the desired qualifications or a loss of employees to defense industries. The report of the census bureau on *Public Employment in April, 1952*, however, showed practically no change in the number of nonschool city employees for the period from April 1951, when the total was 1,101,000, to April 1952, when it was 1,111,000. Pay rolls, on the contrary, maintained the upward trend characteristic of the postwar years, reaching a total of \$266,000,000 for nonschool city employees by April 1952, compared with \$239,000,000 in April 1951 and \$222,200,000 in April 1950.

Home Rule; Municipal Surveys.—The new home rule charter for New Orleans, La., authorized by constitutional provision in 1950, was submitted by the local charter committee in 1952 to the city council, which could submit it to the voters with or without modification. Its chief innovation was provision for a chief administrative officer, with considerable executive authority, to be appointed by the mayor. A number of Rhode Island cities established charter commissions in 1952.

The first comprehensive reorganization of the government of Washington, D.C., expected to require about a year to complete, was under way in 1952, under a law effective July 1. It empowered the district commissioners, appointed by the president, to

establish a framework of government under which the 95 offices and agencies would be consolidated into 2 staff agencies, 12 operating agencies and several smaller offices. The commission's plan contemplated creation of a citizen's advisory council of nine members to advise the commissioners on broad policy matters.

The Chicago, Ill., city council established a "little Hoover" commission of five members, headed by the city's budget director, to study possible economies, and appropriated \$100,000 for the purpose. Governmental survey commissions in San Francisco and Los Angeles, Calif., each submitted partial survey reports in 1952. The report and recommendations of the Survey committee of Rochester, N.Y., based on an earlier comprehensive survey by private consultants, were under study by a charter commission. The final report of the Mayor's Committee on Management Survey of the City of New York was nearing completion in the fall of 1952. Many volumes of special studies were prepared during the three years of the committee's existence, not all of which, however, were as yet publicly released.

Traffic and Parking.—The individual programs of the various cities were far too numerous to enumerate, but they included in 1952: construction of an automatic elevator garage in downtown Detroit, Mich.; continuation of its extensive garage building program by Baltimore, Md., and plans for a \$1,000,000 garage in the department store area of Philadelphia, Pa.; construction of its long-planned underground garage by Los Angeles; lease of land to the parking authority of Pittsburgh, Pa., for construction of an underground garage; approval of construction of a second underground garage by the Chicago park district; a long-range \$3,000,000 plan by Kansas City, Mo., to be carried out under federal-state-city urban redevelopment laws.

Urban Redevelopment.—By July 31, 1952, two and one-half years after inception of the program, the number of participating localities had reached 250, of which 168 had gone beyond the initial step of reservation of capital grant funds into the operation of approved local programs and obtained approval of 156 advances for preliminary planning, 81 final planning advances and 19 loan and grant allocations. These program participants had reserved \$205,000,000 in capital grant funds out of \$500,000,000 available. A survey by the Housing and Home Finance agency of 32 cities which had made the most progress under the program by the end of 1951 indicated a strong trend toward reuse of the newly developed areas for residential purposes, with privately financed dwellings predominating but some public housing included. (See also HOUSING.)

Rent Control.—Federal legislation ended all federal rent controls as of Sept. 30, 1952, except in critical defense housing areas and in localities electing prior to that date through their legislative bodies or by local referendum to continue rent controls on the basis of a finding that a substantial housing shortage existed. In the absence of further federal legislation, all federal rent controls were to expire on April 30, 1953. The federal Office of Rent Stabilization announced that up to Sept. 29—the last available day—1,316 communities out of 2,400 which had controls had voted to retain them, involving at least 12,700,000 persons in about 3,900,000 rental units out of a possible 20,000,000 persons in 6,000,000 units. A total of 70% of the major cities elected to retain controls. There were in addition about 120 critical defense housing areas where controls automatically continued. Feeling pro and con ran high in a number of cities, particularly Seattle, Wash., which dropped controls, St. Louis, Mo., and Columbus, O., where they were retained, and Chicago, where a landlords' "strike" designed to take 50,000 apartments off the market was proposed by a Citizens Committee for Rent Decontrol after controls had been extended. (See RENT STABILIZATION, OFFICE OF.)

Progress in Metropolitan Areas.—One of the most striking developments in half a century in meeting the vexing problem of local intergovernmental relations in metropolitan area was the enactment by the Georgia legislature in 1951 of the so-called "plan of improvement" for adjusting city-county relations between the city of Atlanta and Fulton county, devised after decades of study, which came into full effect on Jan. 1, 1952. In general, functions of the city and county were reallocated, with the city taking over all city-type services for the county, such as fire, police, parks and sanitation, and the county taking full responsibility for health services and welfare, which it already administered; certain functions, such as schools, roads and planning continued to be performed by both. The city annexed 82 sq.mi. of fringe areas, including five heavily populated residential sections, which more than trebled its area and increased its population by about 100,000.

In Philadelphia, where a constitutional amendment authorizing city-county consolidation was approved in 1951, an advisory consolidation committee was created by the city council to study the problems involved and the appropriate means for implementing the amendment. A Pennsylvania statute provided early in 1952 for a 14-member metropolitan study commission for Allegheny county "to promote the uniform development of the 129 municipalities within Allegheny County (including Pittsburgh) and to encourage those municipalities to co-operate in meeting the problems attendant to the tremendous growth of the county in recent years." The Community Services Commission for Davidson County and the City of Nashville, Tenn., appointed by the general assembly in 1951 to survey the governmental needs of metropolitan Nashville and the county, issued an extensive report in 1952, recommending annexation of a substantial area to the city and transfer to the county of four functions—health, hospitals, schools and welfare—deemed clearly county-wide in character. (See also ELECTIONS, U.S.; TOWN AND REGIONAL PLANNING; also under individual large cities.)

(A. M. DS.; L. GU.)

Canada.—Early in 1952 the Bank of Canada released some significant financial figures concerning Canadian municipalities: total current municipal expenditure (exclusive of provisions for debt repayment): 1939 \$286,700,000, 1949 \$474,200,000, 1951 \$571,500,000; total municipal revenue: 1939 \$309,900,000, 1949 \$521,100,000, 1951 \$630,500,000; revenue from taxation: 1939 \$271,600,000, 1949 \$432,400,000, 1951 \$528,800,000; net debt outstanding: 1939 \$1,228,600,000, 1949 \$1,052,600,000, 1951 \$1,358,700,000. After research, the Canadian Federation of Mayors and Municipalities noted that costs of municipal services were fast outstripping the limited revenue sources available and that municipal finance and taxation structures were too rigid or too limited to serve as adequate bases upon which the financial affairs of local government could be effectively carried on.

Although 117 out of 184 Manitoba municipalities had surpluses in 1951, the city of Winnipeg illustrated the problems of large urban municipalities by appealing to the provincial government for more money to pay education costs, all but administration costs for social services, 10% of its police force costs and a subsidy on trunk thoroughfares and bridges. In Ontario on March 2, 1952, rent controls ended in 708 municipalities but were retained in 215.

(C. CY.)

Munitions of War. **U.S. Army.**—A listing of the United States army's munitions items of interest for the year 1952 follows:

Battery.—The signal corps developed a process for refining low-grade domestic manganese for use in dry-cell batteries in place of imported high-grade manganese dioxide. The refined

U.S. ARMY'S 280-mm. mobile gun capable of firing both conventional and atomic shells. The giant self-propelled artillery piece was first photographed in 1952

product also approximately doubled the life of the battery.

Betatrons.—Three 24,000,000-v. betatrons, the first ever built for industrial operation, were being used in eastern and mid-western steel foundries to help speed the production of vital armour steel castings required in the army's tank program. These new X-ray giants could penetrate seven to nine inches of steel armour in little more than a minute and greatly speed and improve inspection techniques.

Body Armour.—Studies of penetration resistance of a new type of body armour by the quartermaster corps indicated that it might reduce battle casualties considerably. The eight-pound jacket, made of laminated nylon covered with a water-resistant shell, was submitted to field tests and issuance to combat troops in Korea was begun in 1952. Battle experience demonstrated that the jacket, with its resistance to low-velocity missiles, substantially reduced the number and severity of battle wounds.

Boot Insulation.—A new synthetic rubber insulation designed to replace wool fleece and felt in insulated combat boots was being tested by the quartermaster corps.

Bore-Hole Camera.—This camera for photographing rock strata was developed by army engineers. It would take continuous 360° pictures of a three-inch diameter bore hole for depths to 500 ft. Further tests were expected to improve performance and projection equipment.

Cable.—A new type of telephone and telegraph cable called "spiral-4," developed by the signal corps, was being used in Korea. It could carry about three times as much traffic as the type it replaced.

Cargo Tractor.—The M-8 cargo tractor could serve as a tracked personnel carrier, a cargo carrier or a heavy prime mover for such weapons as the 75-mm. Skysweeper anti-aircraft gun.

Chain Radar.—A guided missile could be followed through use of a chain radar system developed by the signal corps. This system made it possible to obtain accurate ballistic data along the missile's path. The chain consisted of stations spread along the range at advantageous points. Master stations were located at the major missile-launching areas and tracking was initiated simultaneously with the launching. Data from all stations were instantaneously relayed to the master station, enabling observers to watch flight characteristics of the missile. Photographic records were made of radar dials and oscilloscopes. At the terminal end, radar automatically trained cameras with telescopic lenses on the missile as it dived into the target, provid-

ing a record of this vital phase of the missile's trajectory.

Combat Camera.—A light, high-speed combat camera developed by the signal corps featured automatic film transport, four-inch f/2.8 lens and shutter operation permitting ten 1/500-second exposures in five seconds. It used 70-mm. film, 50 exposures to a roll. A built-in knife permitted removal of any exposure before the entire roll was shot. A combined view finder-range finder adjusted automatically for use with either normal lens, wide-angle 2½-in. f/4.5 or 8-in. f/4 lens. The entire outfit weighed only 22 lb.

Combat Garments.—The quartermaster corps was developing a single-layer sponge-plastic cold weather suit employing the vapour barrier principle. It was designed to be worn without underclothing and would reduce the number of items and weight of winter combat uniforms. Immersion tests proved that the buoyancy of the garment made a man unsinkable when wearing a 26-lb. pack. When coming out of the water, even in freezing temperature, the moisture on the body was promptly warmed by body heat.

Flare.—A flare which illuminated an area several hundred feet in radius and lasted more than five hours was invented in Korea by Lieut. Charles J. Husch. The device contained a mixture of diesel fuel, gasoline and napalm.

Jeep.—The new model M-38-A1, being produced by Willys-Overland Motors, Inc., under contract with the ordnance corps, was streamlined. A larger gasoline tank was provided, the hood lengthened and widened and a 72-h.p. F-head engine installed providing 20% more power. The more effective engine coupled with the larger fuel tank increased the cruising range from 180 to 300 mi. without refuelling. Larger springs, new shock absorbers and better brakes were added. Soft plastic seats replaced the hard canvas-covered pads. Ordnance-designed kits adapted the jeep to arctic, desert or water use. One kit, consisting of snorkel (intake) and snorter (exhaust) tubes, allowed the engine to "breathe" while submerged.

Paper Thermometers.—The quartermaster corps developed thermal indicators made of paper capable of determining temperatures ranging from 115° to 500° F. Although initially designed to ascertain thermal radiation of atomic blasts, these thermometers would probably be used in testing other appliances; they were inexpensive and readily disposable, or could serve as a permanent record.

Plastic Bags.—Plastic bags designed to replace glass bottles as containers for whole blood for military use were being tested by the army medical service.

Resuscitators.—A mechanical artificial resuscitator, light and

compact enough to be carried in the standard gas mask carrier with the mask, was developed by the army chemical corps and was being standardized. It could be operated in combat by one man.

Radio.—A broadcasting station on wheels, designed to carry psychological warfare messages to enemy territory, was developed by the signal corps laboratories at Fort Monmouth, N.J. The units installed in trailers could be transported by truck on land, by cargo planes aloft and by ships at sea. The range of the station was several hundred miles. A portable transmitting antenna could be raised 500 ft. in the air by balloon to allow the station to go on the air speedily.

Rifle Grenade.—The new rifle grenade, Energa, was in limited use in Korea. It weighed 0.1 lb. more than the M-9-A1, but its effective range was 100 yd. instead of 40 and its explosive charge constituted 11.6 oz. of the total instead of 4.

Shoepac.—An insulated rubber insert, applying the vapour barrier principle to the existing shoepac and giving greater protection under wet-cold conditions, was developed by the quartermaster corps and was being given field tests in Korea with favourable results.

Sleeping Bag.—As a result of a quartermaster development, processed chicken feathers were to be used in a newly designed sleeping bag-comforter combination which would replace the wool bag. The wind-resistant, water-repellent cotton-covered feather bag afforded twice the warmth of the wool bag.

Spark Plug.—A spark plug designed for underwater operation in amphibious vehicles was in production. It was assembled with a special connector making it an integral part of a waterproof, radio-shielded ignition system.

Tank Cannon.—The Oldsmobile company laid out its plant to comprehend the dual-purpose plan for sustaining the nation during peace and war, and was producing under "combined operations," on an assembly-line basis, the 90-mm. tank cannon on one line and automobiles on an adjacent line; the 3.5-in. bazooka rockets were being made along with auto engines. In its jet engine and forge plants, plans were under way for producing compressors and turbines for jet aircraft engines.

Tanks.—The M-47 was developed and produced after World War II. It, in essence, was a combination of a completely new turret, an improved World War II chassis and a post-World War II engine-transmission. It could turn in its own length, could traverse its turret manually or by power and had an automatic compensator to restore the aim of the 90-mm. gun after each shot. The T-48, or Patton-48, was the first completely new medium tank to be both developed and produced after World War II. It had wider tracks, a 90-mm. high-velocity gun with a quick-change tube, and a 50-calibre machine gun on the turret which could be fired and loaded from within. (R. S. T.)

U.S. Navy.—The shift of emphasis from research and development to production and procurement of naval ordnance, begun in the year 1951, was carried over into 1952. However, research and development continued to have an important share in the over-all program of the navy, with preference given to projects which were closest to fruition. Thus, a number of new weapons moved from planning boards to production lines and others were modified and improved after extensive evaluation tests on the first production models.

Accelerated production and procurement resulted in the awarding of more than 1,600 contracts in 1952, against approximately 1,100 in 1951—an increase of nearly 70%. Steps were taken to give small business a larger share in national defense production, by increasing advertised procurement, cutting proposals into smaller lots and sending a mobile exhibit of ordnance items on a tour of the United States.

The largest single procurement program was for three-inch

THE PATTON-48 medium tank, featuring a one-piece cast hull, was unveiled at the Chrysler corporation's arsenal, Newark, Del., in July 1952

rapid-fire anti-aircraft gun mounts, with a large proportion of the fleet's combatant ships receiving the new mounts during 1952. A completely automatic five-inch dual-purpose gun, with a rate of fire considerably higher than the World War II five-inch, was scheduled for installation in certain new ships under construction.

Development of fire control systems kept pace with the requirements and capabilities of the new gun batteries. Co-ordination between detection and acquisition of the target was improved through the introduction of new electronic equipment.

Encouraging progress was made in new weapons for anti-submarine warfare. New target-seeking torpedoes, to be launched from surface ships, submarines, planes and helicopters, were in production. A new rocket launcher, firing rockets containing several hundred pounds of explosives and controlled by a complete fire control system, was successfully tested and introduced into the fleet.

The production of aircraft rockets was expanded considerably to take care of increased requirements presented by the air force as well as by the navy. The largest program covered the 2.75-in. Mighty Mouse, the first air-to-air rocket to get into service. A fire control system developed for use with this rocket as well as with guns was released to production.

A significant development in the guided missiles field was the awarding of a contract to convert two heavy cruisers, the U.S.S. "Boston" and the U.S.S. "Canberra," to guided missiles ships. The conversion involved extensive modification of superstructures to permit the installation of missile systems. The addition of these guided missiles ships to the fleet would result in a major increase in naval fire power. (M. F. S.)

U.S. Air Force.—The air force spent \$300,000,000 for guided missiles in 1952 compared with \$130,000,000 in the previous year, while the navy spent \$153,000,000 compared with \$34,000,000.

A large portion of this money went for the purchase of actual production missiles, but some of it was used for completion of test and production facilities started in the previous year. The air force completed work on its long-range missile test facility at Patrick air force base, Cocoa, Fla. Missiles, of both air force and navy type, can be fired from Cocoa as far as 5,000 mi. into the South Atlantic, their progress monitored by a number of auxiliary tracking stations along the route.

Major expansion programs at three other missile test centres were completed during the year: an \$8,000,000 expansion at the air force's Holloman air force base, Alamogordo, N.M., used

or short-range and air-to-air missile testing; a \$7,000,000 program at the army-operated White Sands proving ground, N.M., used for ground-air or anti-aircraft missile tests; and a \$9,000,000 expansion at the navy's Point Mugu (Calif.) missile test centre. Holloman air force base was renamed Holloman air development centre.

Work was virtually completed and production ready to start at the new navy-sponsored guided missile production plant of Consolidated Vultee Aircraft corporation at Pomona, Calif., and also at a \$25,000,000 plant built by the Sperry corporation at Bristol, Tenn. Smaller guided missile production facilities were set up at a number of existing aircraft plants.

The development of large ramjet engines for long-range missiles was intensified. Pratt and Whitney Aircraft took over a special ramjet research laboratory at East Hartford, Conn., and Wright Aeronautical expanded its ramjet research facilities at Mt Wood-Ridge, N.J. Ramjets in the 40-in. diameter class were being tested, which, it was believed, might develop as much as 10,000,000 lb. thrust at high altitudes and high speeds. However, no large ramjets had been put into production.

Major progress in missile development was made in anti-aircraft missiles, in air-to-air missiles to be launched by interceptor fighters against attacking bombers, and in short-range surface-to-surface missiles, such as those to be used by the navy in ship-to-shore operations or by the army for front line contratroop use. The long-range intercontinental missile, the ultimate goal of push-button warfare, still lagged in development, however. The major problem was guidance control over long distances. Great progress had been made in short-range guidance, tracking and homing systems, but limited range precluded their application to intercontinental missiles.

Seven new missiles, all scheduled for production, made their appearance during 1952. The air force made its first firings of two "pilotless fighters," the Boeing XF-99 Bowmarc and the Hughes XF-98 Falcon. The Bowmarc was a ground-to-air missile which would perform all the functions of a piloted interceptor without the pilot. It was equipped with electronic equipment which would locate an attacking enemy bomber, lock onto it, track it and either collide with it or explode by proximity.

The Falcon had similar electronics equipment and operated in the same fashion, except that it was launched from an aeroplane. Plans called for it to be carried by a new, delta-wing supersonic fighter, the Convair F-102. The navy had a similar development in a missile known as the Sparrow 1, which was in production at Douglas Aircraft company. It had not been disclosed by what aeroplane type it would be carried.

The air force also introduced two "pilotless bombers," the Bell XB-63 Rascal and the Northrop XB-62 Snark. These types differed from the pilotless fighters in that they were intended for offensive rather than defensive use. The Rascal was a ground-to-air missile launched from a "mother" plane like the guided bombs of World War II, except that it had electronic homing controls for pinpointing its target. This obviated the necessity of flying a piloted aircraft into a well-defended target area; the mother plane could release the missile miles from the target.

The Snark was a surface-to-surface missile of medium-long-range capabilities, but not of intercontinental range. It was an extension in both range and speed of the principle introduced during 1951 in the Martin B-61 Matador, the first pilotless bomber. The navy had a development similar to the Snark. Built by Chance Vought Aircraft, it was known as the Regulus. These two new missiles had not outmoded the Matador; it was continuing in production and substantial numbers were built and tested.

The other new missile was the Terrier 1, a navy missile to be

used for fleet defense. It was a shipboard-to-air two-stage missile, similar in principle to the Boeing Bowmarc.

The year marked the elimination of machine guns in fighter type aircraft of the air force; in the future their sole weapons would be high-velocity rockets. Three new interceptors which were in service were already so armed with 2.75-in. missiles carried in the nose of the fuselage, in a retractable pod under the fuselage or in wing-tip pods, depending on the plane type (the planes were the Lockheed F-94C, the North American F-86D and the Northrop F-89). The interceptors carried up to 48 rockets. All future fighter designs were to carry this type of armament. (J. J. HY.)

Museums. United States.—During 1952, museums in the United States performed their established functions of collecting important objects, preserving them and using them for research and education. The principal directions of growth were in improved methods, expanded services and new museums.

Specimens, the raw materials for museum work, were acquired in several ways. The Chicago Natural History museum obtained many rare examples of early Mexican Indian workmanship from the National Museum of Mexico in exchange for objects of northern Indian and Pacific Island peoples. A large collection of Swedish materials was given the Busch-Reisinger Museum of Germanic Culture at Harvard university. The Samuel H. Kress foundation donated important groups of paintings to the Birmingham Museum of Art, Alabama, and the Portland Art museum, Oregon. Expeditions were sent out by museums to Afghanistan, Iran, Iraq, Turkey and Greece; to New Caledonia, New Guinea and Guam; to Cuba, Trinidad, the Canal Zone and British Honduras; as well as to many parts of the United States.

LEARNING AMERICAN HISTORY first hand during a 1952 summer study program for children at the Missouri Historical Society museum in St. Louis. After listening to stories about steamboats the children took turns at the eight-foot pilot wheel, an exhibit in the museum

The constant work of preserving museum collections usually proceeds quietly behind the scenes, but the Yale University Art gallery, New Haven, Conn., marked the 100th anniversary of the Jarvis collection with a special exhibition showing how 14 of the paintings had been cleaned and treated scientifically to protect them from deterioration. The George Eastman house in Rochester, N.Y., a museum of photography, began a \$100,000 program to preserve motion pictures of historic importance. Old reels were being copied on more durable film and special storage space was being prepared.

Research by museums increased knowledge in many directions. The Academy of Natural Sciences, Philadelphia, Pa., was requested to make a detailed biological study of the Savannah river near which a new atomic plant was under construction. The Franklin institute in Philadelphia leased two buildings to expand its research facilities.

The educational work of museums is primarily through exhibits, and there was important progress in building new and better displays. Among the new installations were the "Electric Theatre" in the Chicago (Ill.) Museum of Science and Industry; a series on "Aerology: Weather in Action" at the Buhl Planetarium and Institute of Popular Science, Pittsburgh, Pa.; the "Gallery of Living Invertebrates" at the American Museum of Natural History, New York city; and a "History of Communications" exhibit in the Ohio State museum, Columbus. In New York and Chicago museums placed exhibits in the show windows of leading stores where they were seen by many thousands of people who seldom visit the museums. While the United Nations Educational, Scientific and Cultural organization held an international seminar at the Brooklyn museum on "Museums in Education," steady progress was being made in correlating the work of museums and schools. When the Newark, N.J., public schools began a new science program in the elementary grades, the Newark museum revised its lending collection to fit. In Brooklyn, N.Y., the board of education installed an exhibit, the "World at Work," in the Brooklyn Children's museum especially for sixth, seventh and eighth grade classes.

Several new museums were opened during 1952, including the National Park Service museum at Custer Battlefield national monument, Montana, the Frye Art museum in Seattle, Wash., and the Wonder Workshop and Junior museum, Bridgeport, Conn. (See also SMITHSONIAN INSTITUTION.) (R. H. Ls.)

Accessions to Art Galleries and Art Museums.—Most princely of museum gifts during the 1952 season was the \$10,000,000 given by John D. Rockefeller, Jr., to the Metropolitan museum in New York "for enrichment of the Cloisters . . . and for the preservation, housing and presentation of its collections." The Cloisters in Fort Tryon park in upper Manhattan house the Metropolitan's superb collection of mediaeval art.

In Richmond the Virginia Museum of Fine Arts was left a \$4,000,000 fund and collection by Mr. and Mrs. A. D. Williams, deceased. Among the 42 old masters were notable canvases by Rembrandt, Frans Hals and Rubens.

Phillips Exeter academy, Exeter, N.H., with \$100,000 given by alumni, was to build the Lamont gallery where there would be a workshop as well as galleries for exhibitions.

The Kress foundation continued to give groups of paintings to museums. They presented 32 paintings to the Honolulu Academy of Fine Arts, 27 to the Portland (Ore.) Art museum and 23 to the Seattle Art museum. Among the most important were "St. Jerome" by Lorenzo Lotto (Venetian, 1480-1556), "Madonna and Child with Saints" by Luca Signorelli (Italian, 1450-1523), and "Portrait of a Man" by Tintoretto (Venetian, 1518-94), all given to Honolulu.

Another gift to Seattle was 20 old master drawings from Roy M. Backus, deceased. These included the "Judgment of Paris"

by Lucas Cranach (German, 1472-1553), "Peasants" by Pieter Bruegel, the Elder (Flemish, 1564-c.1637) and a "Madonna" by Albrecht Dürer (German, 1471-1528).

One of the most important single pictures to enter a museum collection was "The Musicians" by Caravaggio (Italian, 1573-1610), purchased for the Metropolitan museum in New York. The painting had been lost for many years, then was purchased unidentified for £100 by a retired English naval surgeon. The present purchase price was not revealed. Another important painting to go to the Metropolitan was the "Death of the Virgin" by Bartolommeo Vivarini (Italian, 15th century), a gift of Robert Lehman.

Two outstanding paintings were acquired by the Wadsworth Atheneum in Hartford, Conn. One of these was a dramatic picture of the hanging of a white-clothed monk, St. Serapion, by Francisco Zurbaran (Spanish, about 1628). The other was "The Tiger Hunt" by Peter Paul Rubens (Flemish, 1579-1640), acquired for the Sumner collection.

A most unusual Colonial American picture was acquired by the Detroit Institute of Arts. This was the "Head of a Negro" by John Singleton Copley (1738-1815), a most informal but realistic study for the period. It was a sketch for one of the figures in Copley's ambitious composition, "Watson and the Shark."

The Cleveland Museum of Art acquired for the Hanna fund a group of 16 Egyptian limestone reliefs from the tomb of a nobleman in Upper Thebes dating from the 15th or 16th dynasty, 690-650 B.C. They also acquired a great 17th-century Dutch painting, the "Music Party" by Pieter de Hooch. The purchase price was reported as more than \$60,000.

Another important Dutch picture, "The Housekeeper" by Nicholas Maes, signed and dated 1656, was acquired for the City Art museum of St. Louis.

A great Chinese painting was presented by an anonymous donor to the Cincinnati museum. This was a 13th-century scroll, the finest of six surviving paintings by Ma Yuan.

A very important French painting by Auguste Renoir, dated 1881, was acquired for the Minneapolis Institute of Arts. This had formerly been in the Neue Staatsgalerie in Munich and was purged by Hitler as "degenerate" art.

The Albright Art gallery in Buffalo purchased a monumental contemporary bronze, "Sacrifice" (the only casting made), by Jacques Lipchitz, 1947.

Probably the most outstanding early manuscript in America was acquired for the Morgan library in New York. This was a 9th-century French Gospels illuminated at Tours.

The Currier Gallery of Art in Manchester, N.H., inaugurated a policy of building up a collection modest in size but of top quality. As an example they purchased a "Self-portrait" by Jan Gossart (Mabuse) painted about 1515. (See also ART EXHIBITIONS; ART SALES; PAINTING.) (F. A. Sw.)

Great Britain.—The Wellington museum was opened in Apsley house, London, the former London residence of the first duke of Wellington. In York an extension of the Castle museum was opened in the old debtors' prison to house a series of ancient craft workshops, English costume displays and a military museum for the Yorkshire regiments.

The Museums association's new constitution, under which the qualifications of museum officials were recognized by the award of fellowships and associateships, came into effect on April 1.

Commonwealth.—Under the auspices of the committee for museums of the U.N.E.S.C.O. National Commission for Australia, a travelling exhibition was produced by museums throughout the country for circulation abroad, to illustrate the way of life of Australian aborigines.

Museums and art galleries in South Africa took a full part in the national celebrations that marked the tercentenary of Jan

an Riebeeck's landing at the Cape. A new series of dioramas in the South African museum, Capetown, containing life-size reconstructions of extinct reptiles of the Permian-Triassic period and characteristic types of contemporary flora, marked an important advance in display technique in South Africa.

The establishment of four Gandhi memorial museums at Rajahmundry, Sabarmati Ashram, Sewagram and Madura in India was proposed by the Gandhi Smarak Nidhi (Gandhi national memorial fund).

Europe.—Several rooms in the folklore department and important ceramic collections were reopened to the public at the Musée Royaux d'Art et d'Histoire, Brussels, in 1952. At Mariemont, the extensive collection of Tournai porcelain was completely classified and redisplayed. A new museum was established at Tourcoing, Fr., to display ancient costumes. The museum at Chalcis, Gr., was reopened and at Delphi all the sculpture was again on show. The reorganization of the museum on the Acropolis was expected to be completed by 1953. Finds from the 1937-40 excavations at Olympia were added to the collection of sculpture from the Temple of Jupiter already on exhibition at the site museum. Postwar restoration of the Heraklion museum in Crete, containing the material from Knossos and Phaestis, was finally completed.

A new museum, the Netherlands Costume museum, was reopened at The Hague, and major reorganizations, including rebuilding and rearrangement of displays, were carried out at the Rijks-museum, Amsterdam, and at Arnhem, Leeuwarden and Maastricht.

New or rebuilt museums to be opened in Poland included the Lenin museum at Cracow, historical museums in Wrocław, Cracow and Brzeg, a regional museum at Łowicz and a museum of natural and social history at Gorzów.

The International Institute for the Study of Castles established a museum, devoted to the study of the history of castles, at Rapperswil in Switzerland, and issued an appeal for plans and details of castles in all countries. (G. P. G.)

Music. The music year 1952 was marked by an unprecedented exchange of international travel. Entire orchestras and opera groups journeyed by ship and aeroplane across oceans and continents. The Boston Symphony orchestra made its first tour abroad, appearing in major European cities. George Gershwin's opera *Porgy and Bess* had highly successful performances by an all-Negro troupe in Berlin, Vienna and London. The Hamburg State opera took part in the Edinburgh Music festival. The Danish State orchestra flew from Copenhagen to the United States for a series of 38 concerts. Under the auspices of the cultural department of Indonesia, the Bali dancers were flown from their distant island to the United States, with their unusual orchestra of Balinese percussion instruments.

Numerous music festivals were presented in American and European music centres. Of these the most sumptuous was the Paris festival, sponsored by the Congress for Cultural Freedom and devoted to the presentation of musical masterpieces of the 20th century (April 30-June 1). Apart from Paris musical organizations, the Covent Garden opera of London, the Boston Symphony orchestra, the Vienna Philharmonic, the Radio orchestra (RIAS) of west Berlin, the Orchestre de la Suisse Romande and the Orchestra and Chorus of St. Cecilia, Rome, took part in the Paris festival. The operas *Wozzeck* by Alban Berg, *Billy Budd* by Benjamin Britten, *Four Saints in Three Acts* by Virgil Thomson and Vittorio Rieti's *Don Perlimplin* were staged. Among ballet performances at the Paris festival, Henri Sauguet's *Cordelia* and Georges Auric's *Coup de feu* were given for the first time.

Symphonic music was represented at the Paris festival by

works by Debussy, Ravel, Honegger, Milhaud, Poulenc, Koechlin, Messiaen, Roussel, Frank Martin, Stravinsky, Prokofiev, Shostakovich, Bartók, Schönberg, Hindemith, Vaughan Williams, Walton, Constant Lambert, Bohuslav Martinu, Dallapiccola, Villa-Lobos, Walter Piston, Samuel Barber and many others.

The change in popular acceptance of modern works was dramatically demonstrated when Pierre Monteux conducted, on May 8, Stravinsky's *Le Sacre du Printemps*, 39 years after he gave in Paris the world *première* of this challenging work. The music had provoked a riot then; in 1952 there was an ovation.

Among other music festivals in Europe were: the Holland festival at The Hague (June 5-July 4), of which the major event was the performance of the opera *Halewijn* by the Dutch composer Willem Pijper (June 26); *Maggio Musicale* in Florence (May 1-June 20); Strasbourg festival (June 10-25); a choral festival in Aldeburgh (June 14-22), held under the general guidance of Benjamin Britten; the Granada festival (July), in programs of choral and instrumental music by Spanish composers and Spanish-inspired works by French composers; the Festival of Swiss Musical Societies in St. Gallen (July 11-13), which featured a yodelling contest with 2,800 participants; the Lucerne festival (Aug. 9-31), in programs of orchestral music ranging from Bach to Hindemith; and the International Festival of Contemporary Music in Venice (Sept. 10-22).

The Edinburgh festival (Aug. 17-Sept. 6) opened with a Sibelius program conducted by Sir Thomas Beecham. The Hamburg State opera, appearing in Edinburgh for the first time, presented Hindemith's *Mathis der Maler*; the Concertgebouw orchestra of Amsterdam performed several major works by modern composers.

In 1952 the International Society for Contemporary Music gave its 26th festival in Salzburg, where the society was inaugurated in 1923. Works by composers of virtually every country in the world (except the U.S.S.R., which is not a member of the society) were performed.

The opening program (June 20) featured symphonic works by the following German composers: Wolfgang Fortner, Karl Amadeus Hartmann, Winfried Zillig and Werner Egk. The second concert (June 21) included works by Conrad Beck (Switzerland), Hanns Jelinek (Austria), Rudolf Wagner-Regeny (Germany), Paul Csonka (Cuba) and Marcel Quinet (Belgium).

A memorial concert of works by Arnold Schönberg (five orchestral pieces, monodrama *Erwartung* and variations for orchestra) was given on June 22.

A program of chamber music (June 23) included works by Josef Tal (Israel), Roman Vlad (Italy), Phyllis Tate (England), Alfonso Letelier (Chile), Don Banks (Australia), Karl Otto Runolfsson (Iceland) and Jean Martinon (France). Compositions for small orchestra by Claudio Santoro (Brazil), Nils Erik Ringbom (Finland), Humphrey Searle (England), Claus Egge (Norway), Edward Staempfli (Switzerland) and Knudage Riisager (Denmark) were presented on June 24. A concert of chamber music on June 25 consisted of works by Claus Adam (U.S.), Karl Schiske (Austria), Ronald Tremain (New Zealand), Henri Pousseur (Belgium), Marcel Mihalovici (France), Stefans Grové (South Africa), Lex van Delden (the Netherlands) and Guillermo Graetzer (Argentina).

Symphonic music by Tibor Harsanyi (Hungary-France), Bernd Aloys Zimmermann (Germany), Mario Peragallo (Italy) and Pierre Boulez (France) was performed on June 26. A concert of "modern classics" (Stravinsky, Hindemith and Béla Bartók) took place on June 27.

A tragic event marked the concert of orchestral works by modern Austrian composers (June 28). The program as scheduled was to include compositions by Georg Gruber, Cesar Bres-

gen, Wilhelm Huebner, S. C. Eckhardt-Gramatte and Gottfried von Einem. Shortly before the end of Huebner's piece, the conductor, Herbert Haefner, collapsed on the podium and died during a heart attack. The rest of the program remained unperformed.

The concluding concert of the Salzburg festival took place on June 29, with orchestral works by Matija Bravnicar (Yugoslavia), Yoritsune Matsudaira (Japan), Göte Carlid (Sweden), Marius Flothuis (the Netherlands) and Giorgio Federico Ghedini (Italy).

A series of concerts of contemporary music was given in February in Sydney, Austr., with works by Bartók, Britten, Schönberg, Shostakovich and the patriarch of Australian composers, Alfred Hill. A South African music festival was held in March in Capetown. *Tafelberg se Kleed*, an opera on South African themes by the resident composer-conductor Albert Coates, received its first performance; other works heard for the first time were a *Violin Concerto* by Erik Chisholm, English composer living in South Africa, and the *Second Symphony* by the native musician Arnold van Wyck.

There were no special festivals of national music in South America, but successful opera seasons were given in Buenos Aires and in Rio de Janeiro, and performances by visiting opera companies took place in capital cities of South American republics.

In Mexico, the most interesting music events were provided by the Orquesta Sinfónica Nacional. On Feb. 29 Carlos Chávez, the leader of this orchestra, conducted the first performance of his *Violin Concerto*.

A series announced as "Music of the Countries of Popular Democracy," devoted to compositions by Rumanian and Estonian composers, was given in Moscow in January.

In the United States, the 22nd annual Festival of American Music took place in Rochester, N.Y. (April 28–May 8), with works by Menotti, Samuel Barber, Walter Piston, William Schuman, Wallingford Riegger, Morton Gould, Ulysses Kay, Peter Mennin and others. Howard Hanson, the founder of the Rochester festival, conducted the symphonic works on the program.

A festival of the creative arts was inaugurated at Brandeis university, Waltham, Mass., under the general direction of Leonard Bernstein. On June 12 Bernstein conducted his new one-act opera, *Trouble in Tahiti*. On June 14 the Brandeis festival presented a modernized version of Kurt Weill's *Dreigroschenoper*, with a new libretto by Marc Blitzstein. On the same program, the first U.S. hearing of "musique concrète" was given, with a ballet performance of *Symphonie pour un homme seul*, composed for a magnetized tape-recording machine by the Paris radio engineer Pierre Schaeffer.

At Tanglewood, the annual Berkshire Music festival took place in the summer (July 5–August 10). Programs of classical and modern music were presented by the Boston Symphony orchestra and student groups.

The first International Contemporary Music festival in Pittsburgh, Pa. (Nov. 24–30), included programs of symphonic, choral and chamber music by modern composers. Special works were commissioned from European, Latin-American and North American composers, to be performed for the first time at the Pittsburgh festival.

The following new operas had their first performances in 1952: *L'Urugano* by Ludovico Rocca (Milan, Feb. 8); *Yuzuru* by Ikuma Dan (Tokyo, Feb. 11); *Boulevard Solitude* by Hans Werner Henze (Hanover, Feb. 17); *Leonore* by Rolf Liebermann (Basel, March 25); *Proserpina e lo straniero* by Juan José Castro (Milan, March 17); *Acres of Sky* by Arthur Kreutz (New York city, May 7); *Mila Goysalica* by Jakov Gotovac

(Zagreb, May 18); *The Farmer and the Fairy* by Alexandre Tcherepnin (Aspen, Colo., Aug. 13); and *Das Preussische Märchen*, ballet-opera by Boris Blacher (west Berlin, Sept. 23).

One of the most important musical events was the posthumous production of the opera *Die Liebe der Danae* by Richard Strauss (Salzburg, Aug. 14). The score was composed in 1940 and was scheduled for performance in Salzburg in Aug. 1944, but after the final rehearsal all theatres were closed by the Nazi regime, and the public performance of *Die Liebe der Danae* was cancelled.

A revised version of Hindemith's opera *Cardillac* was given for the first time in Zürich on June 20. *Wat Tyler*, historical opera by the English composer Alan Bush, awarded a prize during the 1951 Festival of Britain, was first performed on the Berlin radio on April 3, before its production in England.

Among new ballets, *Rondo vom goldenen Kalb* by Gottfried von Einem was produced in Hamburg on Feb. 1, and *Chemin de lumière* by Georges Auric, in Munich on March 27.

The following symphonic works were performed for the first time in 1952: *Symphony Concertante* by Gail Kubik (New York city, Jan. 7), awarded the Pulitzer prize for music; *Symphony Number Eight*, subtitled *Sinfonia dello Zodiaco* by Francesco Malipiero (Geneva, Jan. 23); *Die Harmonie der Welt* by Hindemith (Basel, Jan. 25); *Concerto for Horn and Orchestra* by Reinhold Glière (Moscow, Jan. 26); *Symphony Number Four* by Paul Creston (Washington, D.C., Jan. 30); *Symphony Number Two* by Alexandre Tcherepnin (Chicago, March 20); *Piano Concerto* by Alexei Haieff (New York city, April 27); *Sinfonietta for String Orchestra* by Nevit Kodalli (Ankara, Turk., May 3); *Symphony Number Seven* by Roy Harris (Chicago, Nov. 20); *Temptation of St. Anthony*, dance-symphony by Gardner Read (Chicago, Dec. 26).

Stravinsky conducted, on Nov. 11, in Los Angeles, the first performance of his *Cantata* for solo voices, female chorus and string quintet, to the text of four English poems of the 15th and 16th centuries.

(N. Sv.)

Popular Music.—In popular music, Johnnie Ray's formula of bursting into tears as he bellowed musical platitudes into a microphone brought him an amazing success. A song called simply "Cry," written by Churchill Kohlman but popularized by Ray, first made the Lucky Strike Hit Parade late in Jan. 1952, and was on top of the list a week later. Meanwhile Ray's own composition, "The Little White Cloud That Cried," a slight variation on the same idea, found its way into the first seven and remained there for eight weeks, although it never quite reached the top. "Please, Mr. Sun" did equally well. By midsummer the Ray voice and style had revived the solid 1930 hit of Roy Turk and Fred Ahlert, "Walkin' My Baby Back Home," and given it a 12 weeks' run on the current Parade, with several appearances at the top.

It was not an impressive year in popular music. The best songs were old-timers or deliberate echoes of already established melodies. Outstanding in the latter class was "Kiss of Fire," adapted frankly by Lester Allen and Robert Hill from the classic tango "El Choclo," by A. G. Villoldo. It made the Hit Parade for 14 weeks, half of the time at the top. "Auf Wiederseh'n Sweetheart," a simple chorus derived by John Sexton and John Turner from a German song by Everhard Storch became the rage in July and held its own for several months. Late in the year the old "Glow-Worm" of Paul Lincke reached the top of the Hit Parade, after Johnny Mercer had added electric modern lyrics to the original lines of Lilla Cayley Robinson, dated 1907.

Another phenomenon of 1952 was the spectacular success of Harold Rome's "Wish You Were Here," after the musical comedy of the same title had almost succumbed to bad notices.

definitely below Rome's standard, it was his biggest hit thus far. Eddie Fisher brought back a relic of 1931, "Lady of Pain," written by Erell Reaves and Tolchard Evans.

The hillbilly influence was emphasized in Curley Williams' "Half as Much," popularized by a Rosemary Clooney record, and "Jambalaya" ("On the Bayou"), which profited by the singing of Jo Stafford. Of a similar type was the rollicking "Shrimp Boats," with a melodic suggestion of the old "Under the Bamboo Tree." "I Went to Your Wedding," a banal torch song by Jesse Mae Robinson, was popularized largely by the recording of Patti Page.

The rest of the popular songs of 1952 had little to recommend them. "A Guy Is a Guy" imitated the ancient "Dutch Company" and "Why Don't You Believe Me?" was close to a phrase in Jerome Kern's "They Didn't Believe Me." "Because You're Mine" took its title from the Mario Lanza motion picture.

There was more originality in Leroy Anderson's "Blue Tango," for which Mitchell Parish supplied the text, and the same composer's catchy "Syncopated Clock" was heard frequently. Other tunes prominent in the Hit Parade were "Slow Poke," "Sin," "Down Yonder" and "Undecided" (all left-overs from 1951), "Domino," "Any Time," "Tell Me Why," "I'm Yours," "Wheel of Fortune," "Blacksmith Blues," "Here in My Heart," and "Somewhere Along the Way." (S. Sp.)

Jazz.—Jazz found the going arduous in 1952. No outstanding new names came to the fore, nor did any fresh ensemble sounds emerge. Rather, it was a year of regrouping and comebacks.

Woody Herman, after struggling long and painfully to piece together a first-rate crew, finally hit solidly with a young, ambitious band sparked by the veteran bassist Chubby Jackson. Count Basie, Duke Ellington and Stan Kenton followed virtually the same paths. Basie, after touring the U.S. with a seven-piece combination for a couple of years, re-formed a big band that to many ears was as thrilling as his great band of the late 1930s and early 1940s. Ellington lost the heart of his or-

ganization in 1951 when Johnny Hodges, alto saxophone, Lawrence Brown, trombone, and Sonny Greer, drums, left him to form their own group. Yet he rebounded in spectacular fashion, and in 1952, driven on by iron-wristed drummer Louie Bellson, again was a pace setter. Kenton, too, lost virtually his entire band at the end of 1951 and laboured for months to reassemble musicians of the calibre of those who departed. However, by midsummer he was leading what many considered to be the best jazz band he had ever had.

Packaged jazz concerts were generally quite successful. Norman Granz still topped them all with his Jazz at the Philharmonic unit by grossing nearly \$1,000,000 on his annual tour, but other shows like the Nat (King) Cole—Sarah Vaughan—Duke Ellington troupe and the Billy Eckstine—George Shearing package also did a large business. Aside from these few concert hall appearances, however, jazz was not welcomed in many places. Dixieland had its home in New York city (with week-end all-star sessions going especially strong), Los Angeles and New Orleans, where the devoted work of the New Orleans Jazz club kept interest alive. Other types of jazz groups found business flourishing only in a few New York night spots and in cities such as Chicago, San Francisco and Philadelphia.

In some quarters the work of Lennie Tristano began to attract more attention and suggested that from this direction might come the next modern movement in jazz.

Thus it was a quiet year for what is normally a turbulent art form, but the resurging interest in large orchestras and the spirited attendance at name-loaded concerts was a suggestion that the same sort of spark that was provided by Benny Goodman in 1934 might again ignite mass appeal. (J. T.)

Recordings.—Since the advent of the LP (long-playing 33 $\frac{1}{3}$ -r.p.m.) system in 1948, and until recently, record manufacturers and their customers were frequently more concerned about the physical sound emanating from a recording than they were about either the intrinsic merit of the music being performed or the ability of the performers. But by early 1952 this trend had reversed itself. Record buyers assumed, and correctly, that the technical advances in sound recording made in the

COMPOSER IGOR STRAVINSKY silhouetted against the stage as he conducted his opera *Oedipus Rex* in Paris during the 1952 concert series, "Masterpieces of the 20th Century." Masks for the opera were designed by Jean Cocteau, who also wrote the libretto

development of the LP system would be incorporated into every record offered for sale by each of the major companies. This was the year both the recording companies and the record buyers shifted their concern almost entirely to the music and its rendition. The large number of companies (more than 100), each set upon making its catalogue distinctive. This was an assurance to the buyers that a vast number of previously unrecorded works would be given estimable performances on records.

Among the year's most noteworthy recordings were the following: On the RCA Victor label—Beethoven's *Symphony Number Nine* played by the NBC Symphony orchestra and sung by the Robert Shaw chorale and soloists all under the direction of Arturo Toscanini; Purcell's short opera *Dido and Aeneas*, performed at the Mermaid theatre in London with Kirsten Flagstad and Thomas Hemsley in the title roles; and Schubert's *Die Schöne Müllerin*, sung by Aksel Schiotz with Gerald Moore accompanying. On Columbia—Alban Berg's unfinished opera *Lulu*, with a cast of soloists and the Vienna Symphony orchestra under the direction of Herbert Haefner; Schönberg's *Erwartung*, played by the Philharmonic Symphony orchestra of New York with soprano Dorothy Dow as soloist and Dimitri Mitropoulos conducting; a reissue of the famed Felix Weingartner performances of the complete symphonies of Beethoven and Brahms; a compilation of all the piano music of Ravel in a three-record LP set with Robert Casadesus as the soloist; and in the field of serious drama, a reading of Bernard Shaw's *Don Juan in Hell* by Charles Laughton, Agnes Moorehead, Charles Boyer and Sir Cedric Hardwicke. On Decca—the 32 piano sonatas of Beethoven played by Wilhelm Kempff. On EMS—Martinu's *Sonata for Flute and Piano* (1946), played by Rene LeRoy and George Reeves. On Cetra-Soria—a complete performance of Verdi's *Don Carlo*, with Nicola Rossi-Lemeni Maria Caniglia and Ebe Stignani in leading roles. On the Bartók Recording society label—a performance of Béla Bartók's *Viola Concerto* with William Primrose as the soloist and the new Symphony orchestra of London conducted by Tibor Serly. On Westminster—a first performance on LP records of Hector Berlioz' *The Trojans at Carthage*, sung in French by the soloists and Ensemble Vocal de Paris with the Orchestre Société des Concerts du Conservatoire conducted by Herman Scherchen; Schubert's *Op. 100, 166 and 168* performed by chamber groups; Beethoven's *Opus 127* (the 12th of the 16 string quartets) played by the Vienna Konzerthaus quartet; and the Bach *Brandenburg Concertos Number Two in F Major* and *Number Four in G Major* played by the London Baroque ensemble under Karl Haas. (J. J. Ry.)

Music in Industry.—The year 1952 witnessed a significant development destined to make planned programs of industrial music available over a greater geographical area of the United States—the long-playing magnetic-recorded tape and playback unit. Hitherto restricted to large metropolitan centres because of the cost of long-distance telephone line transmission, authentic work music could now be utilized by industrial management in smaller cities and isolated communities for the betterment of working conditions.

Because of the economies of its operation, the long-playing magnetic tape playback unit permitted the setting up of central transmission points in small cities where such service could not otherwise be profitably rendered. Similarly, industrial plants in one-industry towns, far from urban centres, could utilize tape-recorded work music to replace the more expensive and unsatisfactory in-plant record systems which, of necessity, limited the choice of music to that of phonograph records.

This development was pioneered and brought to fulfilment by the Muzak corporation, the originator of scientifically arranged work music programs. The consequent availability of authentic work music over greater geographical areas enabled defense

plants relocated in smaller communities, because of the government Plant Dispersal program, to utilize the same functionally designed music programs previously limited to the larger metropolitan centres.

Music for background purposes and atmosphere psychology made startling gains during 1952 in the retail merchandising field, notably supermarkets, largely because of the accelerated trend to self-service. With one out of every four supermarkets entirely self-service in the basic grocery, meat, dairy and produce departments, specialized music programs helped to offset lack of personal contact with customers by creating a friendly musical atmosphere.

Mutual Security Program.

The Mutual Security agency was, during 1952, the branch of the United States government primarily concerned with aid to foreign countries. Created late in 1951, the MSA replaced the Economic Cooperation administration which had been set up to carry out the Marshall plan. The change marked a shift in emphasis from civilian aid to rearmament. Most of the funds appropriated by congress in 1951 and 1952 for Mutual Security aid were earmarked for military "end items": weapons, tanks, munitions, military and naval equipment and the like. Raw materials, food, manufactured goods, machinery and other supplies needed to carry out rearmament programs and to strengthen civilian economies were designated "defense support" aid. Technical assistance of many sorts made up the third main category of foreign aid provided by the United States. As in previous years, western Europe received the bulk of United States military and economic aid but assistance was also provided to most of the countries outside the soviet orbit in Asia, Africa and Latin America.

Congress gave the secretary of defense primary responsibility for the determination of military needs, the procurement of military supplies, their delivery and the supervision of their use. The department of state administered technical assistance programs in a number of countries. However, the director for mutual security, Averell Harriman, had a general co-ordinating and supervisory responsibility with regard to these activities. In addition, he was head of the Mutual Security agency which carried on some of the functions formerly performed by ECA, handled defense support aid and administered technical assistance programs in a number of countries. Within each country receiving aid, a team was formed, headed by the U.S. ambassador or minister, and including representatives of the MSA and the United States military authorities, to ensure that the policy of "one country, one program" was carried out. In Jan. 1952, William H. Draper, Jr., was appointed United States special representative in Europe to co-ordinate aid programs to countries in that area. Reporting to the president, Ambassador Draper acted for both the director of mutual security and the secretary of defense, and was the permanent United States representative to the North Atlantic council, the principal organ of the North Atlantic Treaty organization.

Through these, and some other channels, the United States provided slightly more than \$5,000,000,000 in foreign aid during the fiscal year ending June 30, 1952. European countries and their dependencies received \$3,600,000,000 of this aid; \$924,000,000 went to Asia and the Pacific area; \$191,000,000 to Latin America; and \$174,000,000 to the near east and Africa. About three-quarters of the nonmilitary aid to western Europe went to five countries: France (\$477,000,000); Britain (\$316,-

100,000); Italy (\$218,000,000); Greece (\$203,000,000); and Western Germany (\$201,000,000). Credits accounted for \$659,000,000 of United States aid during fiscal 1952, while grants amounted to more than \$4,300,000,000. Repayment of past credits, returns on previous grants and grants by foreign countries to the United States totalled \$503,000,000, so that the net outflow of foreign aid from the United States was slightly more than \$4,500,000,000 during the fiscal year. Although appropriations for military aid accounted for more than 70% of the money congress granted to the MSA for fiscal 1952, the amount of military aid actually used during that period came to less than \$2,000,000,000 out of the total gross foreign aid of \$5,000,000,000. Because of the time required for manufacture, many military items contracted for during fiscal 1952 would appear only in the aid figures for a later period when they were delivered. Similarly, many of the shipments of civilian goods appearing in the aid figures for fiscal 1952 were paid for out of appropriations granted in previous years. The house committee on foreign affairs estimated that at the end of fiscal 1952 nearly \$9,000,000,000 of unexpended aid appropriations was on hand, but all but about \$400,000,000 had been obligated in one way or another.

The Mutual Security act of 1952 extending the aid program and the life of the MSA for another year passed the house of representatives in final form on June 5 (230-115), the senate on June 9 (59-11) and was signed by the president on June 20. The new law made no fundamental changes in the aid policies defined by the 1951 act. In addition to making some changes in administration and practice, the act added expressions of congressional intent regarding various aspects of the program, for example, the fostering of private investment as a means of increasing the supply of strategic raw materials. After welcoming "the recent progress in political federation, military integration, and economic unification in Europe," congress in a new passage reaffirmed "its belief in the necessity of further vigorous efforts toward these ends. . . ." To encourage such efforts, the new act permitted Mutual Security funds to be granted to NATO, the European Coal and Steel Community created by the Schuman plan treaty, and the organization expected to emerge from discussions of the European Defense Community. Another section of the new act instructed the director of mutual security to withhold aid from any country that was not taking "decisive action to marshal its resources," individually or in co-operation with other countries, for the purposes of mutual security.

Most congressional debate about the act concerned the amount of money to be spent on foreign aid. Pres. Harry S. Truman, in a message to congress on March 6, recommended an appropriation of \$7,900,000,000 for the fiscal year ending June 30, 1953. Of this sum—\$571,000,000 greater than the appropriation for fiscal 1952—about \$5,400,000,000 was to be for military aid, four-fifths of it to European countries. The senate committee on foreign relations, when it reported at the end of April, recommended a cut of \$1,000,000,000 in the authorization, to be applied proportionately to all the items in the president's request. The senate cut the total by \$200,000,000, after defeating an attempt, supported by Sen. Robert A. Taft, to reduce the authorization by another \$1,000,000,000. The house committee on foreign affairs, reporting on May 12, recommended a cut of \$1,000,000,000 in the president's original request, the entire reduction to come out of aid to Europe. On the floor of the house another \$725,000,000 was stricken from the bill, most of the reduction falling on defense support aid to Europe. The house and senate conferees split the difference between the two bills so that in its final form the act authorized somewhat more than \$6,400,000,000 worth of aid. When the money bill reached

WIND TUNNEL at Modane, Fr., for testing airfoils, in use by forces of the North Atlantic Treaty organization in 1952

congress late in June, the house appropriations committee cut \$250,000,000 from the authorizations; the largest part of this sum was to come out of military assistance to Europe and much of the rest was saved by eliminating the proposed contribution of \$45,000,000 to the United Nations Korean Reconstruction agency. The full house then reduced its committee's figures by another \$245,000,000, the largest share again coming from the item for military assistance to Europe. The senate, hurrying to wind up its business, adopted the house's figures. When he signed the appropriation bill on July 15, President Truman called the amount "inadequate" and suggested that additional appropriations might be necessary before the end of the fiscal year.

The table below compares Mutual Security appropriations for fiscal 1953 with the president's requests. In addition to the amounts shown, unexpended funds from previous years were carried over into fiscal 1953. Up to 10% of the funds appropriated for military aid to Europe could be used for economic aid, and vice versa.

MSA funds could be used to purchase military equipment

	President's requests	Congressional appropriations
	(Millions of dollars)	
Europe		
Military	4,145.0	3,128.2
Economic	1,819.2	1,282.4
Near east and Africa		
Military	606.4	499.1
Economic and technical	196.0	181.1
Asia and Pacific

Latin America		
Military	62.4	51.7
Economic and technical	22.0	20.3
Miscellaneous economic and technical assistance	53.8*	27.7
Total military assistance	5,425.0	4,219.8
Total economic and technical	2,499.0	1,782.1
Total mutual assistance	7,924.0	6,001.9

*This includes \$24,000,000 for the United Nations International Children's Emergency fund which did not appear in the president's message on mutual security assistance. Congress cut the figure to \$6,700,000.

manufactured in one western European country for delivery to another. This procedure enabled the manufacturing country to earn dollars and expanded European military production as well as providing cheaper supplies. In the fiscal year ending June 30, 1952, about \$600,000,000 of MSA funds were spent in this way. Another \$84,000,000 of defense department funds were spent in western Europe to procure supplies for United States forces. As procedural difficulties were overcome the volume of offshore procurement was expected to increase. France, where the largest sum was spent, counted on this form of dollar aid to balance its national budget; MSA funds were used to buy military equipment made in France which was then turned over to the French authorities. Difficulties arose during the year as the result of a misunderstanding as to how large a sum the United States had promised to spend for this purpose.

During 1952 there were almost continuous official discussions about trade with the soviet bloc. The Battle act, which replaced earlier U.S. legislation on this subject, came into full effect on Jan. 24, 1952. In the first six months of the act's operations, reported by Averell Harriman, the flow of strategic goods to the U.S.S.R. and its satellites had been regulated by agreement, following consultation with the countries receiving United States aid. Goods of primary strategic importance were completely embargoed, except for a few shipments made under prior contracts. In these cases the president used the discretion allowed him by the act to decide that cutting off aid to the countries making the shipments would be detrimental to the security of the United States because of their other contributions to mutual defense. Goods of secondary strategic significance were shipped to the soviet bloc when that seemed necessary to secure for the shipping countries, mostly in western Europe, supplies of important materials from the "iron curtain" countries.

Most United States aid to western Europe was conceived as part of the rearmament program of the NATO countries agreed on at the Lisbon conference in Feb. 1952. The expected economic impact of this program was a continuous source of con-

cern for most European governments throughout 1952. By diverting men and materials from production of goods for home consumption or export, rearmament was likely to increase balance-of-payments deficits and add to domestic inflationary pressures. Prospects of increasing living standards were jeopardized. United States aid in the form of military end items helped reach the arms goals but as a rule did little to relieve economic pressures. Defense support aid helped both in the manufacture of arms and in relieving some of the pressure on the civilian sector of the economy, but was available only in limited amounts. In order to carry the arms load, provide a satisfactory standard of living and get along with less foreign aid, the countries of Europe had to produce more and had to maintain internal financial equilibrium. During the first half of 1952, industrial production in western Europe was lagging but prices were fairly stable. There was some improvement in the foreign trade position of the area as a whole, compared with the first half of 1951, but the dollar deficit continued to be serious.

In these circumstances the Organization for European Economic Cooperation was devoting much of its energy to studying the problems involved in increasing European production by 25% by 1956. The council of the O.E.E.C., meeting at the ministerial level, on March 28 approved the report of a working party on productivity, trade and payments and financial stability which included special studies of the problems arising in coal, electricity, iron and steel, agriculture, housing, transport and manpower. The report made a number of recommendations about policies member governments might adopt and led to further studies by the O.E.E.C. of continuing problems. One of the most important of these was an examination by seven eminent independent economists of the internal financial situation of a number of countries, with particular attention to Great Britain, France, the United States and Belgium. The experts stressed the importance of monetary measures for bringing about stability, but a ministerial committee that reviewed the report took the view that a country's position might require a greater use of fiscal measures or direct controls.

The principal step forward in economic co-operation under the aegis of the O.E.E.C. was the prolongation on June 30 of the life of the European Payments union for another year. At the same time, a change was made in the terms of the agreement so that countries would have to pay a larger share of their debts to E.P.U. in gold in the early stages of their indebtedness. As a result, the E.P.U. could expect to increase its liquid assets, but debtors were compensated by a reduction in the amount of gold they would have to pay as they approached the limit of their quota. A series of special arrangements were also made with Belgium, Italy, Portugal and Switzerland whereby these countries would continue to grant some credit to the E.P.U. although they had already exceeded the limit of their obligation to do so, and would receive part of their future surpluses in gold. Fearful of the future strain on their resources, the E.P.U. managing board had hoped to secure additional dollar aid from the United States but the MSA refused the request.

France and Britain, at one time major creditors of the E.P.U., continued to be its debtors during 1952. France got a short-term credit of \$100,000,000 to relieve the pressure on its gold supply during the second quarter of the year, and repaid the loan in June. Britain exceeded its quota in May and thereafter had to pay its debts to the E.P.U. fully in gold. The tendency for countries to get into extreme positions caused difficulties for the E.P.U., but in mid-1952 there seemed to be some levelling off in the positions of a number of countries.

This improvement was in part the result of monetary measures taken in a number of countries to check inflationary

EMBERG DAM at Kaprun in Salzburg, Aus. The concrete arch power dam, built with Marshall plan aid, formed a great water reservoir in the Austrian Alps.

pressures. In the case of France and England, however, limitations on imports from other O.E.E.C. countries, taken originally in 1951, were somewhat intensified during 1952. Some other countries, including Germany, Italy and the Netherlands, were able to remove restrictions on imports, and by September these three countries and Belgium, Ireland, Norway, Portugal, Sweden and Switzerland had reached the O.E.E.C. goal of permitting the quota-free entry of 75% of their imports from other O.E.E.C. countries (measured by 1948 trade). A steering board for trade was created by the O.E.E.C. to deal with the problems of trade liberalization.

The greatest step forward in European economic co-operation during 1952 was taken outside the O.E.E.C. The Schuman plan treaty, creating a European Coal and Steel Community, was ratified, and the Community's principal organs were set up and started work. How fast they would proceed to create a single market and a co-ordinated investment program for the iron, coal and steel industries of France, Germany, Belgium, the Netherlands, Luxembourg and Italy depended in part on the fate of the treaty creating a European Defense Community including these countries and on the ability of France and Germany to reach some understanding on the Saar.

As the year drew to a close there were more and more indications that in all major capitals discussions were under way to find some method of reducing western Europe's dependence on United States aid and of making the military alliance of NATO an effective machine for dealing with common political and economic problems. "Trade, not aid" was the slogan put forward by R. A. Butler, the British chancellor of the exchequer. Effective action of whatever sort would depend largely on the United States, where a new administration, coming into office in Jan. 1953, would be faced with old problems in a new guise. (See also EUROPEAN UNION; NORTH ATLANTIC TREATY ORGANIZATION.) (W. DD.)

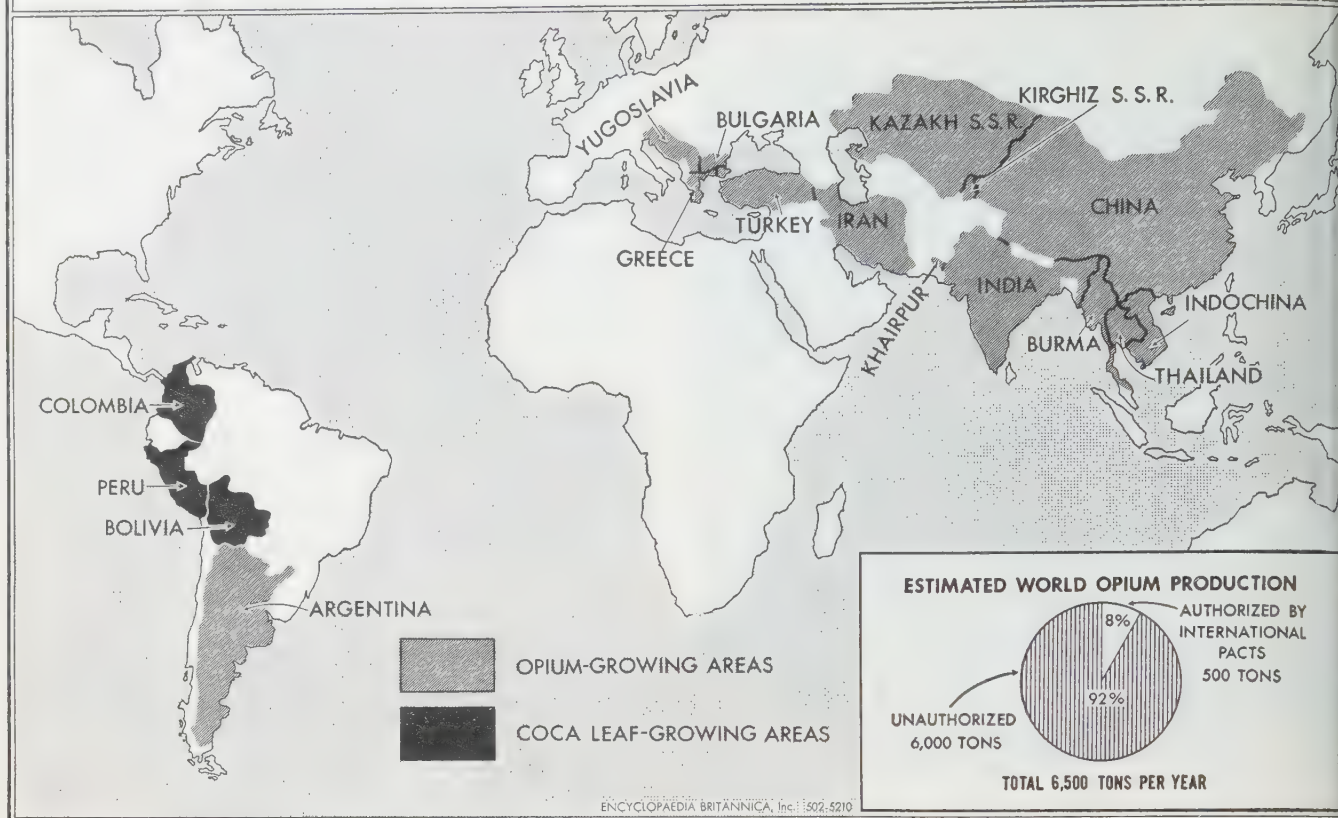

Naguib, Mohammed (1901-), Egyptian soldier and statesman, was born at Khartoum. He attended the Royal Military academy, Cairo, and was commissioned at the age of 19. During World War II Naguib was occupied with administrative duties. More active service followed in the war with Israel when he became a brigadier in command of a machine-gun and infantry regiment and won a reputation for leadership and courage. When the army's smouldering discontent about corruption in palace and government circles burst into flame in July 1952, Naguib was chosen as leader of the coup d'état. On July 23 King Farouk's palace was surrounded and all approaches to Cairo were guarded. Within a few hours the king was forced to abdicate and leave the country. Naguib made Aly Maher prime minister and announced the army's demands for reform, which were to affect not only political circles—particularly the Wafd, the principal political party—but also itself. Immediately he was bitterly opposed by the Wafd. On Sept. 7 Aly Maher resigned and Naguib became prime minister and minister of war and marine. In Cairo on Oct. 29 he signed, on behalf of the Egyptian government, an agreement with the Sudanese political parties, the text of which implied *de facto* recognition of the 1899 condominium agreement unilaterally abrogated by Egypt in 1951.

Narcotics and Narcotic Traffic. During the seventh session of the United Nations Commission on Narcotic Drugs, held in New York city in 1952, facts and figures were presented to the commission indicating that the international illicit traffic in narcotic drugs had increased dangerously. The commission recognized that strong efforts would have to be made immediately to cope with the problem, and recommended that the Economic and Social council request the U.N. secretary-general, Trygve Lie,

FLOW BATH for a patient in a government hospital for drug addicts at Lexington, Ky. Convalescents, following the withdrawal of drugs, were helped by baths in which a steady flow of hot water relaxed taut muscles; the canvas cover was for violent patients.

WORLD NARCOTIC-PRODUCING AREAS

1. To advise governments that this baneful trade cannot be combated successfully by national efforts alone, and that international co-operation is of essential importance;

2. To urge governments to take immediate steps, if they have not already done so, to adopt the practice of direct communication between national administrations controlling the illicit traffic; if within a country where more than one department exercises control thereof, the government concerned shall determine the channel through which such communication is to be conducted; and

3. To ask governments to review their preventive organizations to ensure that they are adequate to combat the illicit traffic within their territories.

The United States representative, H. J. Anslinger, reported that investigations, arrests and seizures in Japan proved conclusively that Chinese Communists had been smuggling heroin from China to Japan, and using the proceeds from the sale thereof to finance party activities and obtain strategic materials for China. While the source of all heroin seized in Japan was attributed to China, transhipped through Hong Kong or North Korea, approximately 50% of the total seized was either definitely labelled with a Chinese address as the source or else marked with well-known brands of Chinese heroin. Other seizures were traced by the statements of arrested Communists who stated the heroin was sold to raise funds for party activities. Still others were traced by the fact that large-scale traffickers who were arrested were closely associated with known smugglers of war materials to and from China.

These facts refuted the statements made by the soviet representative on the U.N. Commission on Narcotic Drugs, and proved that Communist China had been flooding Japan and other countries with opium and heroin.

The representatives of the Union of Soviet Socialist Republics and Poland voted almost invariably against all decisions and recommendations of the commission.

Important achievements of the commission during the 1952 session included:

1. Completion of the study of the principles embodied in the first 13 articles of the proposed international single convention on narcotic drugs.

2. Adoption of a resolution relating to synthetic drugs which recommended that the Economic and Social Council request the secretary-general to draw the attention of governments to the desirability, should they not already have done so, of

a. Bringing all synthetic narcotic drugs under their national legislation on narcotic drugs as soon as they appear;

b. Acceding without delay to the protocol of Nov. 19, 1948;

c. Limiting their estimates of such drugs to medical and scientific requirements;

d. Exercising strict control over the manufacture and therapeutic use of these substances; and

e. Making regulations to ensure that all packages containing a synthetic narcotic drug should be clearly marked with a double red line so that they may be identified by the competent services.

3. The adoption of a resolution which contained the recommendations of the commission to the Economic and Social Council on the report of the Commission of Inquiry on the Coca Leaf.

4. The adoption of a resolution (set forth in 1, 2 and 3 in the first paragraph of this article) relating to international co-operation to control the illicit traffic in narcotics.

5. The adoption of a resolution relating to the illicit trafficking in narcotics by the crews of merchant ships and civil aircraft.

Penalty Amendment to Federal Narcotic Laws.—In 1950 Congressman Hale Boggs of Louisiana introduced in congress a bill to provide increased penalties for violation of the federal narcotic and marihuana laws, particularly for second and subsequent violators. Late in 1951 congress passed the Boggs bill and the president signed it on Nov. 2, 1951.

Immediately after passage of the Boggs act, the bureau of narcotics started a nation-wide intensified effort aimed at second and third offenders. There were indications during the early part of 1952 that the increase in teen-age drug addiction had been halted. Another effect of the Boggs act was a noticeable shift by narcotic traffickers to other rackets, following the sentencing of a number of second and third offenders to long prison terms. Legislation similar to the Boggs act was enacted by several of the states as an amendment to their uniform state law. In Maryland, where this state legislation had been in effect for some months, the illicit narcotic traffic had been very substantially reduced. (See also DRUG ADMINISTRATION, U.S.; LAW.)

National Geographic Society. Astronomers of the National Geographic society-Palomar observatory sky survey in July 1952 entered the fourth year of their project of mapping the heavens with the 48-in. Schmidt wide-angle phototelescope. Their "portrait of creation" was more than half completed. A tailless comet of 15th magnitude in the constellation Cepheus, revealed on a plate exposed Aug. 18, was the sixth such discovery made by the survey. The photographic plates as completed continued to reveal hitherto unrecorded clusters of nebulae up to 350,000,000 light-years out in space and to contribute evidence on the birth and death of stars. The sky atlas, to consist of 1,870 photographs from separate plates, was expected to provide astronomers enough material for a century of study. Palomar's 200-in. Hale telescope was already being turned on interesting objects found on the sky survey plates.

Complementing the sky survey, a photographic sky chart detailing the southern Milky Way was completed in 1952 by Francis J. Heyden of Georgetown University observatory. Its 17 plates were made by phototelescope at Bocaiuva, Braz., by Father Heyden as a member of the U.S. army air forces-National Geographic society expedition studying the sun eclipse of May 20, 1947.

At Khartoum, Anglo-Egyptian Sudan, on Feb. 25, 1952, George Van Biesbroeck, representing the society, photographed the star field immediately surrounding the sun during the three minutes of eclipse totality. Returning to Khartoum six months later, he photographed the same star field at the same declination at night. Comparison of the photographs was expected to provide a check on the "Einstein shift"—an apparent displacement in the position of distant stars resulting from the sun's gravitational pull on the rays of star light passing close by.

Infant bluefin tuna and wahoo less than one-half inch long were noted among specimens netted in the Gulf Stream east of Miami by scientists of the National Geographic society-University of Miami study of ocean plankton. Their presence pointed to a spawning area of these two game fish in the northern part of the Caribbean sea. The research, begun in mid-1950 and using the laboratory ship "Megalopa," had traced the Florida lobster through 11 stages of growth during the six months it drifts before settling to the bottom as a lobsterling. The study was adding important clues to the movement of ocean currents.

The continuing National Geographic society-Bartol Research

foundation cosmic ray study program directed by Bartol physicist Martin A. Pomerantz in 1952 further correlated earthly cosmic ray intensity with the occurrence of solar flares and other violent activity on the sun, pointing to the sun as a source of cosmic rays. On Sept. 2, Pomerantz left for India to conduct eight months of cosmic ray field research from a base at Aligarh Muslim university, near New Delhi.

The first United States expedition of naturalists to the Fort Archambault region of French Equatorial Africa and French Cameroun in May and June, included National Geographic staff artist-naturalist Walter A. Weber and staff photographer Volkmar Wentzel. It brought back bird and mammal specimens for the Smithsonian institution and the American Museum of Natural History. The party was led by its principal sponsors, Dr. and Mrs. Carnes Weeks of Mt. Holly, S.C.

The society cosponsored a British summer study of the geology and glaciology of Norway's West Spitsbergen Island with Cambridge university, the Royal Geographical society of London and the Scott Polar Research institute, Cambridge.

Gilbert Grosvenor, president of the National Geographic society, received the Samuel Finley Breese Morse medal of the American Geographical society at that group's centennial celebration in New York city on Aug. 5.

Published in the *National Geographic Magazine* during 1952 were about 1,100 colour pictures—760 full pages—of peoples, places and natural history subjects throughout the world.

Four large ten-colour wall maps, drawn by the society's cartographers, were distributed as 1952 supplements to the magazine. Subjects were North America, southwest Asia, the far east and the Pacific ocean.

The society late in 1951 published *Stalking Birds with Color Camera*, a 328-page book containing 331 natural-colour photographs of North American birds. Text and pictures were largely the work of Arthur A. Allen of Cornell university, Ithaca, N.Y. A new enlarged edition of the *Book of Fishes* was scheduled for late 1952 publication. A new *National Geographic Magazine* cumulative index in two volumes, 1899-1946 and 1947-51, issued during the year, included a pictorial story of the society's scientific activities and its magazine.

News releases describing National Geographic-sponsored researches or supplying timely news background information on world areas suddenly coming into prominence were again sent regularly by the society's news service to daily newspapers, press associations and radio news staffs throughout the country requesting the service. Special maps accompanied some of the news releases. Geographic school bulletins continued to be sent for classroom use during the school year to about 35,000 teachers.

The society's membership at the year's end numbered 2,015,000 family units. Its headquarters address is 16th and M streets N.W., Washington 6, D.C. Officers: president and editor, Gilbert Grosvenor; vice-president and associate editor, John Oliver La Gorce; secretary, Thomas W. McKnew; treasurer, Robert V. Fleming. The society's research committee: chairman, Lyman J. Briggs; vice-chairman, Alexander Wetmore. (G. Gr.)

National Guard. During 1952 the national guard played a major role in the defense structure of the United States, with approximately 400,000 guardsmen in about 5,400 units in state and federal service.

More than 2,000 army and air guard units were in active military service, including 8 infantry divisions, 3 regimental combat teams, numerous nondivisional units and 22 air guard wings. Four national guard infantry divisions were serving overseas: the 28th division of Pennsylvania and the 43rd of Connecticut, Rhode Island and Vermont in Europe; the 40th

division of California and the 45th of Oklahoma in Korea. Numerous other army and air guard units served in Europe, the far east and other far-flung bases.

In addition, individual guardsmen specialists were serving in all branches of the army and air force around the world. Overall, approximately 150,000 officers and men of the national guard were in active military service.

In 1952 a number of national guard units and thousands of individual guardsmen started to return to civilian life and state control. Large-scale return of air guard units started in July and virtually the entire 80% of the air national guard that had been ordered to active military service was scheduled to be back in state status by the early part of 1953, with the bulk of the approximately 450 air units back by the end of 1952.

Congress passed legislation authorizing the retention of army national guard unit designations on active military service beyond the two years of active service required of national guardsmen. The states were authorized to organize parallel units for those kept on active military service to absorb national guardsmen returning to state service and for the training of new recruits.

Release from active military service of national guard anti-aircraft artillery units was announced by the department of defense, beginning in April 1952, as a means of increasing the anti-aircraft defenses of the United States. To bring these units to full strength, age requirements for original enlistments and re-enlistments in nondivisional national anti-aircraft artillery units were liberalized.

During 1952 approximately 200,000 army guardsmen and about 10,000 members of the air national guard participated in annual 15-day field training exercises, and a record attendance at field training and armoury-air base training was set.

National guardsmen again responded to local requests during emergencies such as floods, tornadoes and other domestic crises. They continued to train under an intensified program as members of first-line components of the armed forces with definitely established M-day missions.

National Labor Relations Board. During the fifth year of administering Title I of the Labor Management Relations act (commonly known as the Taft-Hartley law), the National Labor Relations board again received a record number of both representation and unfair labour practice cases. These two types of cases constituted all but a small portion of the work handled by the board. During the 1952 fiscal year 15,900 of these cases were filed: 10,447 were petitions for representation elections and 5,453 involved charges of unfair practices against either employers or unions or both.

In this period the board also conducted the largest number of representation elections in its history: 6,873. More than 86% of the 791,000 eligible employees cast valid ballots. A majority of employees voted for union representation in 4,808 of these elections, or 69%. This compared with 74% in favour of union representation during fiscal year 1951, with 73% in 1950 and with an average of 81% under the Wagner act from 1935 to 1947.

The five-member board issued 2,506 formal decisions during the 1952 fiscal year: 315 in unfair labour practice cases and

2,191 in representation cases.

Important questions involved in the decisions by the board during the year included: (1) the extent of an employer's right to lay off, or to "lock out" employees during a collective bargaining dispute; and (2) the types of electioneering or "campaign tactics" which an employer or a union may use.

On the question of whether an employer may lock out employees, the board held that the statute declares these general principles: an employer may shut down a plant for genuine economic reasons, such as a decline in business, or for other reasons not connected with the union activity of his employees. But the law forbids a shutdown which is intended to defeat or curtail the employees' activities in union organization or in collective bargaining, unless the employees' activities in these areas make operation of the plant extremely difficult. Thus, a majority of the board held in two cases that an employer violated the act by locking out his employees in order to require them to accept his terms in collective bargaining.

The board ruled in these cases that an employer may not use a lockout either: (1) to break a deadlock in bargaining with the employees' representative; or (2) to counter union actions which he believes are undermining his bargaining position. The two cases presented nearly identical situations. In each, a group of employers, bargaining together through an association, had bargained in good faith with the employees' union to a deadlock. Thereupon, the union members at the plant of one employer in the group went on strike. There was no threat to strike any other employer, but the other employers viewed the strike at one plant as part of a strategy by the union to undermine the bargaining position of the employer group, by calling a strike against the individual employers in turn. To defeat this anticipated strategy, the employers whose plants were not struck laid off their employees for about a month in each instance. A board majority (Chairman Paul M. Herzog dissenting) ultimately held that these lockouts collided directly with the act's guarantee to employees of the right to engage in union activities without interference by the employer. Moreover, the board ruled, such a layoff of nonstriking employees was prohibited by the section of the law which forbids an employer to discriminate against employees because of their union activities.

In another case, union members engaged in brief, recurrent work stoppages as part of a campaign to obtain 100% organization in the plant. These stoppages, although limited to a few employees in a few departments, were disrupting work throughout the plant because of the close integration of operations. The board held, by a divided vote, that the employer was justified in shutting down the plant until he had obtained a no-strike pledge from the union. In another case, the board held that a group of automobile dealers were justified in locking out their mechanics because of the union's threat to strike the dealers' repair shops without notice. The board found that the strike threat created such uncertainty about future operations as to justify the lockout, in view of the fact that a sudden strike was likely to tie up customers' automobiles while under repair. In this case, union members at two companies had already struck.

The legal propriety of other tactics which a union or employer may use in economic contests and in election campaigns was at issue in a number of cases. A majority of the board (Member Abe Murdock dissenting) ruled that an employer could lawfully discharge employees who circulated handbills attacking the quality of the employer's product. The handbills were circulated as part of a campaign to compel the employer to meet the contract terms sought by the union, but they did not bear the union's name or state that they were related to a labour dispute. The circulars asserted that the employer, a televi-

station, was offering only "second-class" programs. The majority held that, in circulating such an attack on the product, the employees "went beyond the pale" of those concerted activities which are protected by the act.

A number of cases concerned the conditions under which an employer might make an antiunion speech to his employees during working time. The leading case involved a department store, where the company president assembled the employees on store premises during their paid time, to deliver a speech urging them to vote against a union. The speech was given only a few days before the board election, in which the employees were to vote on whether or not they wanted union representation. When the union requested a similar opportunity to speak to the employees, the company refused it. Union solicitation had long been banned in the store. A majority of the board (Member James J. Reynolds, Jr., dissenting) held that the refusal of speaking time to the union interfered with the rights guaranteed to employees. The board directed the employer to accord the union an equal opportunity to speak to the employees, if in the future its officials delivered preelection addresses during working hours on company premises. The board held that: "An employer who chooses to use his premises to assemble his employees and speak against a union may not deny that union's reasonable request for the same opportunity to present its case, where the circumstances are such that only by granting such request will the employees have a reasonable opportunity to hear both sides." Noting the existence of the general no-solicitation rule in the store, the U.S. court of appeals which reviewed the board's decision upheld it. The board also applied this doctrine in a number of representation election cases, where employers had made antiunion speeches on company time and premises just before a board election and then denied the union employees an equal opportunity for reply.

The legality of other types of union or employee activity was before the board in other cases. In one, the board reaffirmed its long-established rule that an employer may discharge employees who engage in an illegal strike. A board majority held in this case that the union had called the strike to compel the employer to agree to a contract providing unlawful preference for union members. In other cases, the board ruled that employers violated the law by discharging employees who (1) complained to other employees about the amount of work required by the employer, or (2) endeavored to persuade fellow employees to join in bringing a suit for back pay under the Wage and Hour law.

During 1952 Ivar H. Peterson was appointed to the board by Pres. Harry S. Truman, to fill the unexpired term of James J. Reynolds, Jr., who had resigned to return to private industry. In Sept. 1952 the board was composed of Chairman Paul M. Herzog and Members John M. Houston, Abe Murdock, Paul Styles and Peterson, with George J. Bott as general counsel. (See also LABOUR UNIONS; LAW; STRIKES.) (P. M. HG.)

National Museum: see SMITHSONIAN INSTITUTION.

National Parks and Monuments. United States.—Approximately 17,000,000 visitors were recorded at the 28 national parks of the United States in the 12-month period ended Sept. 30, 1952, and another 24,500,000 at other areas administered by the national park service of the U.S. department of the interior. The overall travel was 13% greater than that of a year earlier.

Small increases in protective staffs in some parks and monuments were more than offset by the additional work resulting from the increased public use. Roadside cleanup was reduced in several western national parks by the distribution of trash

bags to motorists who were requested to make use of them during their stay. A reduction in the cleanup problem, as well as in vandalism, also followed publication of an article in *Natural History Magazine* regarding the damage being wrought by what the author aptly termed "The Great American Litterbug." *Natural History Magazine* also supplied, for distribution to motorists, stickers bearing the slogan "Don't Be a Litterbug," for placement on the rear side window of their automobiles.

During 1952, a number of important donations were made to assure preservation of important scenic and historic properties as part of the national park system. The largest donation, totaling \$1,236,000, was for the acquisition of lands for the Cape Hatteras national seashore recreation area, N.C. Half of this sum was donated by the Avalon and Old Dominion foundations, set up by the children of Andrew W. Mellon; the other half was made available by the state of North Carolina. In 1937 congress authorized establishment of the national seashore recreation area, to include about 30,000 ac. of ocean front, unspoiled by commercial or other unsightly developments. Not far distant are two units of the national park system—Kill Devil Hill National memorial, where the Wright brothers made their memorable flight, and Fort Raleigh National Historic site, scene of the first attempt by the English to settle within the United States.

Linville Falls, in western North Carolina, and adjacent land became part of the Blue Ridge National parkway as a result of a \$95,000 donation by John D. Rockefeller, Jr., for purchase of the property. Jackson Hole Preserve, Inc., gave 800 ac. for inclusion in Grand Teton National park, Wyo.

Preservation of the site of Fort Caroline in Florida was virtually assured by the donation of approximately \$40,000 by Charles E. Bennett of Florida and others, to match funds made available by congress. Fort Caroline was the site of a 16th-century French Huguenot settlement. Part of the donated funds were earmarked for archaeological investigations.

Among other significant donations were 600 ac. for the Blue Ridge National parkway by the commonwealth of Virginia; 400 ac. for the Natchez Trace National parkway, by the state of Mississippi; and 35,000 ac. given by the Collier corporation to the state of Florida for eventual inclusion in Everglades National park, Fla.

The Harpers Ferry National Monument project in Maryland-West Virginia was brought nearer to completion when the state of West Virginia, with a \$350,000 appropriation, began acquiring approximately 400 ac. within the project, and the state of Maryland appropriated funds to acquire the 900 ac. comprising its portion of the project.

Three new areas were established during the year—Chicago Portage National Historic site, Ill.; Virgin Islands National Historic site, Saint Croix, V.I.; and Shadow Mountain National Recreation area, Colo.

The most spectacular occurrence of the year was the eruption, after 18 years of quiescence, in Halemaumau, firepit of Kilauea volcano, Hawaii National park. During the first few days of the eruption, 70,000 persons came to witness the activity, most of them arriving after dark, since the eruption was more spectacular at night.

Other noteworthy developments and activities of the year included purchase of the holdings of the Rainier National Park company, which for years had operated concession facilities in Mount Rainier National park, Wash.; greater public interest in the scenic qualities of Dinosaur National monument, Utah-Colo., as evidenced by increased popularity of exploratory boat trips down the scenic Green and Yampa canyons; dedication of the new museum at Custer Battlefield National monument, Mont.; and the appointment by Secretary of the Interior Oscar

L. Chapman of Horace M. Albright, a former director of the national park service, and John O. Brew, director of the Peabody Museum of Archaeology and Ethnology of Harvard university, to the advisory board on national parks, historic sites, buildings and monuments. (C. L. Wl.)

England and Wales.—The National Parks commission designated the North York Moors national park in Feb. 1952 and initiated action which would lead to the setting up of national parks in three further areas—Cornwall, Exmoor and the Yorkshire dales. A new long-distance route (*i.e.* proposed continuous right of way) was approved by the minister of housing and local government, the Cornish North Coast path (135 mi.), which would be largely within the Cornish national park. A loop route on easier ground was added in the Peak District national park to part of the Pennine Way long-distance route (250 mi.). The commission examined the proposals of the British Electricity authority for the extension of hydroelectric schemes at Dolgarrog and Maentwrog in Snowdonia and secured the inclusion, in the private act of parliament authorizing these extensions, of several important safeguards to the natural beauty of the area and its features of special scientific interest; notably provision for the appointment by the electricity authority, after consultation with the commission, of a landscape consultant to advise on spoil disposal, land restoration, etc.

Australia.—*New South Wales.*—Approval was given to a proposal to set up Warrumbungle national park (8,900 ac.), part of the Warrumbungle range (4,000 ft.) in the western part of the state. The area has high scenic value and is of geological interest.

Queensland.—Three additional national parks were set up: Mt. Spec (Townsville), 18,500 ac. of mountain, forest and jungle; Mt. Aberdeen (Bowen), 4,120 ac., a peak in the jungle commanding wide vistas; and Mt. Maria (Innisfail), 800 ac., a high jungle overlooking the sea. The reserved areas totalled 7,650,000 ac. The total number of visitors to the reservations during the year was 250,000.

Tasmania.—Scenic reserves were increased by 6,344 ac., which included a coastal strip of 100 mi. at the fiord of Port Davey and a camping area on the Derwent river at New Norfolk; the total national scenic reserves were thus brought to 527,720 ac. A road was built to open up skiing grounds in the Ben Lomond national park.

Canada.—The national parks were visited by 2,115,000 people during the summer, an increase of about 12% over 1951. Roads and tracks were maintained and extended, 226 mi. of highway hard surfaced, new walks, bridges and fire roads made.

Italy.—The directors of the Gran Paradiso national park (243 sq.mi.) contested a proposal to erect an overhead cable across part of the park, and secured a suspension of the proposal in order to permit further negotiation. Several special studies in biology, entomology and physiography were carried out in the park by the University of Turin. Plans were made for the establishment in 1953 of an alpine biological station, with a laboratory, at Cogne in the park.

Northern Rhodesia.—The build-up of flora and fauna in the Kafue national park was satisfactory. Busk tracks were made in the southern (Namwala) and northern (Kasempa) sections in preparation for limited opening of those areas in Aug.–Sept. 1953.

Southern Rhodesia.—New national parks were proclaimed at Victoria falls (207 sq.mi.), Zimbabwe (3 sq.mi.) and Mtarasi falls (7 sq.mi.), and the Robert McIlwaine national park (22 sq.mi.) was scheduled for proclamation. These additions brought the number of national parks and game reserves to seven, with a total area of 5,649 sq.mi. In the Wankie game reserve (5,249 sq.mi.) facilities for tourists were improved and water sup-

plies for game increased with boreholes and dams.

Tanganyika.—Regulations were prepared for the administration of the Serengeti national park (4,880 sq.mi.) which would include arrangements to charge 10s. a vehicle and 5s. a person for entry permits. (*See also* TOURIST TRAVEL.) (H. M. As.)

Navies of the World. At the end of 1952 there were two great navies, those of the United States and of Great Britain. Other major fleets were those of the U.S.S.R., France and Italy, followed by Sweden, the Netherlands, Turkey, Spain, Australia, Canada, Argentina, Brazil and Chile. There were also no fewer than 42 not so well-balanced and lesser navies. Several of the smaller countries continued to add to their naval strength by acquiring small warships from the United States and Great Britain. The comparative strengths in ships, of and above the escort vessel categories, of the navies of the world were as shown in the table on page 495.

The principal trends in the navies of the larger maritime powers in 1952 were the building of large numbers of coastal and inshore minesweepers, the adaptation of large destroyers as fleet antisubmarine escorts, the conversion of smaller destroyer types into fast antisubmarine frigates, the reconstruction and conversion of aircraft carriers to operate larger and faster aircraft and an increase in the speed and underwater endurance of submarines.

Among the naval events of the year which shocked and stirred the world were the loss of 176 officers and men when the United States destroyer minesweeper "Hobson" was cut in halves by the United States aircraft carrier "Wasp" in the Atlantic on April 26; the disappearance of the French submarine "La Sibylle" with her crew of 48 on Sept. 24; and the explosion of Great Britain's first atomic bomb in the Monte Bello Islands off Australia in which the British frigate "Plym" was expended on Oct. 3. Several large-scale international naval exercises were carried out by North Atlantic Treaty organization countries, including Exercise "Beehive II" in the Mediterranean and Exercise "Castanets" and Exercise "Mainbrace" in western and northern European waters, respectively.

Many British warships were concerned in the Korean campaign and others were called upon to deal with the emergencies in the middle east. Many United States, Australian, Canadian and New Zealand warships were active in the Korean theatre.

United States Naval Strength.—A giant aircraft carrier of 59,900 tons, named "Forrestal," was laid down. Twelve aircraft carriers of the "Essex" class were converted on lines similar to the newly completed "Oriskany" and the recently converted "Essex" to enable them to operate heavier aircraft. At the end of 1952 all four of the "Iowa" class battleships were in commission. Four heavy cruisers and 17 destroyer escorts which had been on the disposal list since the end of World War II were restored to the navy list and placed in the reserve fleet. The United States navy comprised 28 fleet aircraft carriers, 8 light fleet carriers, 66 escort carriers, 15 battleships, 2 battle cruisers, 29 heavy cruisers, 43 light cruisers, 348 destroyers, 269 escort

destroyers and frigates, 200 submarines, 219 minelayers and minesweepers, 148 patrol vessels, 950 amphibious craft, 675 fleet auxiliaries and 1,800 service craft, a total of 4,800 vessels.

British Naval Strength.—Late in 1952 there were six fleet aircraft carriers, six light carriers and one escort carrier. The newly built large fleet aircraft carrier "Eagle" was accepted into the royal navy on March 1. Progress was made with the construction of the light fleet carriers "Albion," "Bulwark" and "Centaur," but the remaining ship of the class, the "Hermes," was not launched. The light carriers "Hercules" and "Leviathan" were still suspended. Of the five surviving battleships, only one was in commission at the end of the year, the "Vanguard" being flagship of the home fleet and the four of the "King George V" class relegated to reserve and laid up in a state of preservation.

There were 26 cruisers including a cadets' training ship and a trials ship. No building progress was made with the cruisers "Blake," "Defence" and "Tiger." Destroyers numbered 93, excluding 15 under conversion to fast frigates and 4 large destroyers of the "Daring" class being completed. There were 165 frigates and 53 submarines, excluding 4 midget submarines. Other vessels included 3 fast minelayers, 3 aircraft maintenance carriers, 2 monitors, 60 ocean minesweepers and many coastal craft, miscellaneous ships and auxiliaries.

Commonwealth.—Australia had a compact navy including a light fleet carrier (a sister ship was under construction in Great Britain, and until it was completed the British government was lending a similar ship), 3 cruisers, 5 destroyers (4 more under construction), 5 fast antisubmarine frigates under conversion from destroyers, 14 frigates and 32 fleet minesweepers.

Canada also had a well-balanced navy of 1 light fleet carrier (lent from Britain and to be replaced by a new ship, the

HAULING UP a survivor from the minesweeper "Hobson" after it was rammed by the U.S. carrier "Wasp" and sank with 176 of its crew. The collision took place during mid-Atlantic night manoeuvres in April 1952. This survivor was coated with fuel oil from the "Wasp's" ruptured tanks

*Four or fewer.

Other naval forces, not shown in the table because they comprise only minor war vessels, are those of Bulgaria, Ceylon, Finland, Haiti, Honduras, Hungary, Iceland, Iraq, Nicaragua, Panama, Paraguay and the Philippines.

"Powerful"), 2 cruisers, 11 destroyers (4 of which were to be converted to fast antisubmarine escorts), 24 frigates (14 more were under construction or projected), 30 fleet minesweepers and numerous smaller craft.

U.S.S.R.—The total available naval strength at the end of 1952 was 3 battleships, 14 cruisers, 3 coast defense ships, 85 destroyers, 38 frigates, 370 submarines, 26 escort vessels and numerous minesweepers, minelayers, patrol vessels, torpedo boats and ancillary ships.

France.—Two more destroyer escorts (frigate type) were acquired from the United States. The construction of the anti-aircraft cruiser "De Grasse" was continued. The fleet comprised 2 light aircraft carriers, 1 escort carrier, 2 battleships, 5 cruisers, 9 destroyers, 28 frigates, 12 submarines and numerous patrol vessels, miscellaneous ships and auxiliaries.

Italy.—The navy consisted of 2 old battleships, 3 cruisers, 3 destroyers, 15 frigates, 5 torpedo boats, 23 corvettes and a number of minesweepers and auxiliaries, 3 destroyers and 7 torpedo boats having been converted and rerated as escorts (frigates).

Other European Countries.—Sweden had 4 cruisers, 3 coast defense ships (small battleships), 12 destroyers, 4 of which were to be converted into frigates, 3 antisubmarine frigates, 6 torpedo boats (small destroyers), all to be converted into frigates, 24 submarines, 2 minelayers and numerous motor torpedo boats, minesweepers and other vessels.

The Netherlands had a well-balanced navy of 1 light fleet aircraft carrier, 2 light cruisers (2 larger cruisers were nearing completion), 6 destroyers, 10 frigates, 7 submarines, 4 escort minesweepers, 1 minelayer and a number of other warships.

Spain had 6 cruisers, 20 destroyers, 12 frigates, 6 submarines,

6 minelayers, 7 fleet minesweepers and many minor warships and auxiliaries. Six corvettes, four submarines and seven fleet minesweepers were being built.

Turkey possessed 1 battle cruiser more than 40 years old, 10 destroyers, 11 submarines, 13 ocean minesweepers and numerous other warships and auxiliaries.

South America.—Argentina had 2 old battleships, 5 cruisers, 1 coast defense ship, 11 destroyers, 4 torpedo boats (smaller destroyers), 7 frigates, 3 submarines, 8 minesweepers and other craft.

Brazil possessed 1 old battleship, 2 cruisers, 9 destroyers, 8 frigates, 3 submarines, 10 corvettes and numerous smaller craft.

Chile had 1 old battleship, 2 cruisers, 6 destroyers, 6 frigates, 7 submarines and a number of miscellaneous ships.

Modern Types of Warships.—The principal types of modern warships in the navies of the world were as follows:

Fleet Aircraft Carriers.—"Midway" (U.S.), 45,000 tons, fourteen 5-in. guns, 137 aircraft, 212,000 s.h.p., 33 knots; "Eagle" (British), 36,800 tons, sixteen 4.5-in. guns, 110 aircraft, 152,000 s.h.p., 31½ knots; "Oriskany" (U.S.), 30,800 tons, eight 5-in. guns, 100 aircraft, 150,000 s.h.p., 33 knots; "Implacable" (British), 26,000 tons, sixteen 4.5-in. guns, 72 aircraft, 148,000 s.h.p., 32½ knots.

Light Fleet Aircraft Carriers.—"Saipan" (U.S.), 14,500 tons, 50 aircraft, 120,000 s.h.p., 33 knots; "Theseus" (British), 13,350 tons, 35 aircraft, 40,000 s.h.p., 25 knots; "Belleau Wood" (U.S.), 11,000 tons, 45 aircraft, 100,000 s.h.p., 32 knots.

Battleships.—"Iowa" (U.S.), 45,000 tons, nine 16-in. and twenty 5-in. guns, 212,000 s.h.p., 33 knots; "Vanguard" (British), 44,500 tons, eight 15-in. and sixteen 5.25-in. guns, 130,000 s.h.p., 30 knots; "South Dakota" (U.S.), 35,000 tons, nine 16-in. and twenty 5-in. guns, 130,000 s.h.p., 28 knots; "Jean Bart" (French), 38,750 tons, eight 15-in. and nine 6-in. guns, 150,000 s.h.p., 30 knots; "King George V" (British), 35,000 tons, ten 14-in. and sixteen 5.25-in. guns, 110,000 s.h.p., 28½ knots.

Large (Battle) Cruisers.—"Alaska" (U.S.), 27,500 tons, nine 12-in. and twelve 5-in. guns, 150,000 s.h.p., 33 knots.

Heavy Cruisers.—"Des Moines" (U.S.), 17,000 tons, nine 8-in. and twelve 5-in. guns, 120,000 s.h.p., 33 knots; "Oregon City" (U.S.), 13,700 tons, nine 8-in. and twelve 5-in. guns, 120,000 s.h.p., 33 knots.

Light Cruisers.—"Worcester" (U.S.), 14,700 tons, twelve 6-in. and twenty 3-in. guns, 120,000 s.h.p., 32 knots; "Fargo" (U.S.), 10,000 tons, twelve 6-in. and twelve 5-in. guns, 100,000 s.h.p., 32½ knots; "Superb" (British), 8,000 tons, nine 6-in. and ten 4-in. guns, 72,500

s.h.p., 31½ knots; "Tre Kronor" (Swedish), 7,500 tons, seven 6-in. guns, 100,000 s.h.p., 33 knots; "Diadem" (British), 5,900 tons, eight 5.25-in. guns, 62,000 s.h.p., 32 knots.

Destroyers.—"Mitscher" (U.S.), 3,675 tons, 5-in. and 3-in. guns; "Daring" (British), 2,610 tons, six 4.5-in. guns, 54,000 s.h.p., 34 knots; "Gearing" (U.S.), 2,425 tons, six 5-in. guns, 60,000 s.h.p., 35 knots; "Jutland" (British), 2,400 tons, five 4.5-in. guns, 50,000 s.h.p., 31 knots; "Öland" (Swedish), 1,800 tons, four 4.7-in. guns, 44,000 s.h.p., 35 knots.

Frigates.—"Relentless" (British), 1,705 tons, two 4-in. guns, two 21-in. torpedo tubes, 40,000 s.h.p., 34 knots; "Mounts Bay" (British), 1,580 tons, four 4-in. guns, 5,500 i.h.p., 19½ knots; "Amethyst" (British), 1,490 tons, six 4-in. guns, 4,300 s.h.p., 18½ knots; "Brecon" (British), 1,175 tons, six 4-in. guns, three 21-in. torpedo tubes, 19,000 s.h.p., 25 knots.

Submarines.—"Tang" (U.S.), 1,570 tons, six 21-in. torpedo tubes, 20 knots; "Amphion" (British), 1,120 tons, one 4-in. gun, two 5-in. guns, ten 21-in. torpedo tubes, 4,300 b.h.p., 18 knots; "Créole" (French), 820 tons, one 3.5-in. gun, ten 21.7-in. torpedo tubes, 3,000 b.h.p., 17 knots; "K-1" (Russian), 1,457 tons, two 4-in. guns, ten 21-in. torpedo tubes, 22½ knots. (R. V. B. B.)

N.E.A.: see SOCIETIES AND ASSOCIATIONS, U.S.

Nebraska. Known as the "Cornhusker state," Nebraska is situated in the west north central portion of the U.S. Land area: 77,227 sq.mi., including an estimated 564 sq.mi. of water. Population (1950 census), 1,325,510, an increase of 9,676 or 0.7% since 1940. Urban population constituted 46.9% of the total. Capital city: Lincoln, pop. 98,884; largest city: Omaha, pop. 251,117.

History.—The regular session of the state legislature was to meet Jan. 6, 1953. Nebraska is represented in congress by two senators and four representatives. The elected state officials for 1951-53 were: governor, Val Peterson (Rep.); lieutenant governor, Charles Warner (Rep.); attorney general, Clarence S. Beck (Rep.); auditor, Ray C. Johnson (Rep.); treasurer, Frank B. Heintze (Rep.); superintendent of public instruction, Freeman Decker (nonpartisan); secretary of state, James Pittenger (Rep.) (appointed upon the death of incumbent Frank Marsh); chief justice, Robert Simmons (nonpartisan).

Education.—The 6,127 elementary schools in 1950-51 had 8,835 teachers and 171,543 enrolled pupils; the 551 high schools, 3,108 teachers and 60,084 pupils; the 4 state normal schools (which since 1949 also grant liberal arts degrees), 238 teachers and 4,516 students. Total expenditures for common schools for the year ending June 30, 1951, were \$52,786,583. The state university is located in Lincoln; there are 3 other universities, a municipal university in Omaha, Creighton (Catholic) University in Omaha, and Nebraska Wesleyan (Methodist) in Lincoln. There are 14 four-year colleges and 5 junior colleges. There are 253 private, parochial and denominational schools in the state. The state holds 1,632,439 ac. of land, valued, in 1952, at \$18,962,800, as a permanent endowment for its public schools. The permanent public school endowment fund was \$15,077,485.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the biennium, 1951-53, the legislature appropriated \$42,007,620 for public assistance, \$21,831,720 of which came from federal funds. This represented the largest public assistance budget in the state's history. During 1951-53 (first eight months of 1952) there was an average case load of 756 persons per month receiving blind aid with average payments of \$63.93; 22,306 persons per month receiving old-age assistance with average payments of \$52.80; and 7,361 dependent children receiving aid with average payments of \$37.27. A 1952 special session of the legislature raised the maximum old-age assistance payments from \$55 to \$60 per month.

The state maintains 18 charitable, mental, reformatory and penal institutions under the supervision of the state board of control. On July 1, 1952, the total population of these institutions numbered 8,660. The state had 112 hospitals (13,844 beds) registered with the American Medical association.

Communications.—The total road mileage of the state in 1952 was 105,729, of which the state maintained 9,659 mi. There were 6,326 mi. of steam railway. The 1951 legislature appropriated \$34,990,000 for highway purposes for the 1951-53 biennium.

There were 372 airports in the state, 5 of which were state-owned and 65 municipally owned. There were 25 daily newspapers and 440 other newspapers and periodicals of all kinds published in the state. The state had 24 radio stations and 2 television transmitters.

Banking and Finance.—The state budget for the 1951-53 biennium was \$173,269,571.08, the largest in its history. For the fiscal year ending June 30, 1952, the state's revenues were \$80,909,182.89, expenditures were \$84,835,542.70. Federal grants furnished were \$15,482,160.90. The net long-term debt of the state was nil.

On June 30, 1952, there were 287 state banks in the state with total resources of \$425,581,807.66. On the same date there were 123 national

SUBMARINE U.S.S. "Pickerel" coming up out of the Pacific ocean at an angle of 48° during 1952 sea trials near Hawaii. The "Pickerel" was a guppy (Greater Underwater Propulsive Power) submarine with a snorkel (breathing apparatus for lengthy submersion)

Table I.—Principal Crops of Nebraska

Crop	Indicated		Average 1941-50
	1952	1951	
Corn, bu.	254,880,000	187,620,000	223,532,000
Wheat, bu.	97,371,000	58,073,000	70,067,000
Oats, bu.	47,272,000	60,816,000	61,349,000
Barley, bu.	2,924,000	4,620,000	17,892,000
Rye, bu.	1,720,000	1,717,000	3,570,000
Potatoes, bu.	8,250,000	6,000,000	10,518,000
Sugar beets, tons	812,000	683,000	704,000
Hay, tons	6,009,000	6,234,000	4,481,000
Sorghum grain, bu.	1,840,000	1,664,000	2,374,000
Beans, dry (100-lb. bags).	952,000	838,000	921,000
Soybeans, bu.	2,112,000	1,276,000	546,000

banks with total resources of \$1,046,327,000.

Agriculture.—There were in 1952 approximately 107,183 farms in the state with a total area of 47,466,828 ac. Tenant farmers (1950) operated 38.9% of all farms.

Manufacturing.—In 1952 there were 1,133 manufacturing establishments (not including dairy establishments employing less than 5 persons), with 58,400 production workers, earning \$135,377,549. The chief industry is meat-packing, mainly at South Omaha. (J. W. Rs.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Nebraska in 1949 and 1950, listing

Table II.—Mineral Production of Nebraska

Mineral	(In short tons, except as noted)		1949	
	1950	Value	Quantity	Value
Clays	100,000	\$ 109,000	87,000	\$ 85,000
Petroleum (bbl.).	1,547,000	3,300,000	330,000	730,000
Sand and gravel	5,078,000	3,168,000	5,115,000	2,912,000
Stone	737,000	1,042,000	505,000	841,000
Other minerals		6,403,000		5,534,000
Total.		\$14,022,000		\$10,102,000

all items whose value exceeded \$100,000. Data for 1951 were not yet available. Nebraska ranks 41st among the states in value of mineral output, with 0.12% of the U.S. total.

Negroes, American. The issue of civil rights for Negroes was intensified during the presidential election year of 1952, beginning with sharp controversy in both the Republican and the Democratic national conventions. In each the split between advocates of strong federal reform and states rights gradualism was compromised in the final party planks on civil rights, but militant pressure by Negro political leaders, especially that led by Congressman Adam C. Powell, Jr. (Dem., N.Y.), forced more forthright campaign stands from the candidates of both major parties. During the year, Pres. Harry S. Truman appointed two Negro members to his committee on government contract compliance, to enforce the anti-discrimination clauses in government purchases and orders.

Legal Developments.—The U.S. supreme court restrained the Brotherhood of Railway Trainmen from contract discrimination against Negroes, and also agreed to hear on appeal anti-segregation school suits from Kansas and South Carolina, which decisions would also cover pending cases from Delaware, Florida and Virginia. In the Cicero, Ill., riot case, a federal court found the police chief and three town officials guilty of conspiracy to violate the civil rights of Harvey Clark, whose moving into a restricted apartment house precipitated the riots. The Delaware chancery court ruled that Negro children must be admitted to mixed high and elementary schools because of unequal facilities. Still unsettled on appeal were several of the most important general suits involving the legality of the entire system of educational segregation, including those in Delaware, Virginia, South Carolina, Florida, Louisiana and the District of Columbia. The murder by bombing Christmas night, 1951, at Mims, Fla., of Harry T. Moore, a Negro educator and state coordinator of the Florida branches of the National Association for the Advancement of Colored People, had national repercussions. Moore, who was heading a campaign for the indictment of the sheriff of Lake county for the fatal shooting of a Negro prisoner in his charge, was posthumously awarded the 1952 Spingarn medal. Representatives of 75 trade unions formed a

NEGRO DOLLS specially designed to fill a need among Negro children and replace white dolls painted brown or dolls based on stereotypes of the "mammy" or "pickaninny." The new dolls were anthropologically correct, based on careful measurements of scores of Negro children

National Negro Labor committee to combat discrimination in industry.

Educational and Cultural.—By 1952, state universities in 12 southern states had admitted Negro students, primarily to certain graduate and professional divisions (Arkansas, Delaware, Kentucky, Louisiana, Maryland, Missouri, North Carolina, Oklahoma, Tennessee, Texas, Virginia, West Virginia), and four of them to the undergraduate college. It was estimated that more than 1,100 Negroes attended those institutions during the year. At the triennial convention of the united chapters of Phi Beta Kappa, Howard university, Washington, D.C., and Fisk university, Nashville, Tenn., were among the new colleges admitted. Negro college enrolments became difficult to trace with increasing integration; the U.S. office of education estimated this total as 74,526 in 1950; the 1951 annual *Crisis* survey reported 42,226 or more Negroes enrolled, with 6,130 bachelor degrees granted, 271 masters and 14 Ph.D.s. The University of Tennessee, Knoxville, admitted its first Negro student, and Groton school, Groton, Mass., announced its first Negro accepted. The public-school system of Cairo, Ill., abandoned segregation without untoward incident.

After a successful tour of the United States, a third version of George and Ira Gershwin's opera, *Porgy and Bess*, with a star Negro cast including William Warfield and Leontyne Price, was sent to Europe under state department auspices, and received ovations in Vienna and Berlin. Similar reception was given Dean Dixon, Negro orchestral conductor, in many European centres, culminating with invitations to conduct at the Venice International and the Sibelius festival of 1952, the latter leading to his appointment as coconductor of the Gothenburg, Swed., and the Helsinki, Fin., orchestras. Dixon in his concert programs featured several compositions of Negro composers, notably the works of Howard Swanson, whose *Short Symphony* received

the New York Music Critics' Circle award in 1951, and of Ulysses Kay, Guggenheim fellow at the American academy at Rome. Discrimination at Constitution hall, Washington, D.C., was broken with a spring concert at which Dorothy Maynor was soloist, while *Porgy and Bess* played at the National theatre as the second attraction under its new nondiscriminatory policy.

The film version of Alan Paton's *Cry, the Beloved Country* was selected as the British nominee for the International Selznick award contest. Its star, Canada Lee, a well-known Negro actor, died May 9 in New York city.

Ralph Bunche was elected president of the American Political Science association. Peter M. Murray, already a member of the house of delegates of the American Medical association, was elected vice-president of the Medical Society of the County of New York.

In sports Negro athletes set six Olympic records at the Helsinki games, while five Negro boxers won gold medals in the boxing world championships. Heavyweight Joe Walcott was the recipient of the Edward J. Neil trophy award, and the Professional Golfers association, after a long campaign sponsored by Joe Louis, approved participation by Negroes in P.G.A. co-sponsored tournaments. Nehru, Jawaharlal (1889–), Indian statesman, born at Allahabad, United Provinces, on Nov. 14. For his earlier career see *Encyclopædia Britannica*. Arrested in Aug. 1942, following congress' call for civil disobedience, Nehru was released in June 1945, and in March 1946 took a leading part in the negotiations with the British cabinet mission on Indian independence. In September of that year he became vice-president of the first all-Indian executive council (i.e., prime minister of the interim government). On Aug. 15, 1947, when the Indian subcontinent was partitioned, he was appointed prime minister and minister for external affairs, posts in which he continued when India became a republic on Jan. 26, 1950. Nehru entered upon his fifth term as congress president on Sept. 8, 1951.

The Indian prime minister's year began with a brief election tour of West Bengal (Dec. 31, 1951–Jan. 2, 1952) followed by a visit to Bihar. On Feb. 13 it was made known that he had been returned with a substantial majority for the Allahabad-East-cum-Jaunpur constituency. He addressed a conference of state governors and *rajpramukhs* held in New Delhi on March 14–15. Many of the prime minister's engagements during 1952 emphasized India's quest for material betterment and technical development: he inaugurated the Indian Science congress and opened the Jute Research institute's laboratories in Calcutta (Jan. 2); signed the India-U.S. technical co-operation fund agreement (Delhi, Jan. 5); laid the foundation stone of Kandla Port, on the Gulf of Kutch (Jan. 10); opened an important chemical and dyestuffs plant at Parnera, Bombay (March 17); opened a community projects conference (Delhi, May 7); and inaugurated the Central Road Research institute near New Delhi (July 16). On June 14 he had made a nation-wide broadcast on the country's food situation. (See also INDIA; PAKISTAN.)

Nepal. An independent kingdom in the Himalayas, Nepal lies between India and Tibet. Area: c. 54,000 sq.mi. Pop. (1951 est.): 7,000,000. Aboriginal stock is Mongolian, with Hindu admixture. Language: Gorkhalis, or Gurkhas, speak Parbatia, of Sanskrit origin; Bothias use Tibetan; Newars, from

southern India, speak Gubhajius, resembling Tibetan but with many Sanskrit words. Religion: Buddhism mixed with Hinduism. Capital, Kathmandu (pop. c. 110,000). Ruler, Tribhubana Bir Bikram Shah Deva.

History.—Inaugurating on July 4, 1952, the newly constituted 61-member advisory assembly at Kathmandu, King Tribhubana said that the establishment of the assembly was another big step toward democracy. He also said that the cordiality between Nepal and Tibet had not been affected by the presence of Chinese in the latter country.

On July 21, however, the new constitutional regime suffered a setback when Bishewar Prasad Koirala, chairman of the Nepali Congress party, ordered his elder brother Matrika Prasad Koirala to resign from the premiership because he had refused to reconstruct the cabinet according to the party's wishes. On Aug. 10, M. P. Koirala resigned from office and the king reluctantly took over the administration himself. On Aug. 14 he proclaimed that he would rule through five advisers till a representative council of ministers could be set up.

On Sept. 3 the Nepali Congress party asked the king to put an end to the advisers' regime and to entrust the party with the forming of a new government. The next day King Tribhubana flew to New Delhi and was greeted at the airport by Jawaharlal Nehru, the Indian prime minister. Shortly after his return to Kathmandu he appointed on Sept. 26 a 15-member commission to investigate land holdings and to suggest reforms.

On July 30, in a northwestern district, 14 Nepali Communists were arrested when they were returning through one of the passes from Tibet. Documents said to be important were seized.

It was announced from Delhi on Aug. 25 that the Indian government had expressed to the British and Nepali governments its desire that the 1947 arrangement under which Gurkha recruits for the British army were attested in special recruiting depots on Indian territory near the Nepali border should be terminated and alternative arrangements made. Under the 1947 arrangement India maintained 12 Gurkha battalions (the old Indian army had 20) and the British army 8. As some of the latter were serving in Malaya, the Indian Communist party criticized the government for allowing the "recruitment of Gurkhas on Indian soil for the British war against the people of Malaya."

Finance and Banking.—Estimated gross revenue 12,500,000 rupees. Monetary unit: Nepal rupee, with an exchange rate (Nov. 1952) of 13.33 rupees to the pound sterling, or 4.76 rupees to the U.S. dollar.

Foreign Trade.—(1944–45) Imports 32,520,000 rupees; exports 37,376,000 rupees. Estimated exports to India (1951) 130,000,000 rupees; estimated imports from India 66,000,000 rupees. Principal imports: textiles, cigarettes, salt, paraffin, sugar, spices, machinery, medicines and boots and shoes. Principal exports: food grains, jute, timber, oilseeds, potatoes, hides and skins.

Transport and Communications.—Roads (1950): 237 mi. suitable for motor vehicles. Licensed motor vehicles (Dec. 1950): cars 220; commercial 80.

Nervous System: see PSYCHOSOMATIC MEDICINE.

Netherlands. A kingdom of northwest Europe, the Netherlands is bounded north and west by the North sea, east by Germany and south by Belgium. Area: 12,868 sq.mi. (not including the waterways and sheets of water larger than 185 ac.). Pop.: (1947 census) 9,625,499; (Oct. 1951 est.) 10,286,250. Language: Dutch. Religion (1947): Roman Catholic 38.50%, Dutch Reformed 31.03%, Reformed Churches 7.93%, nonchurch members 17.04%. Chief towns (pop., 1951 est.): Amsterdam (cap., 845,266); Rotterdam (684,658); The Hague (571,853); Utrecht (195,121); Haarlem (164,007); Eindhoven (143,965); Groningen (137,719); Tilburg (122,551); Nijmegen (112,799). Ruler, Queen Juliana; prime minister in 1952, Willem Drees.

History.—The most important event in domestic politics in 1952 was the general election for the second chamber, which

took place on June 25. During the campaign preceding the election, both Liberal and Anti-Revolutionary (Calvinist) parties levelled strong criticism at the post-World War II government policy which was said simply to exemplify the influence wielded by the Labour party in the government coalition. Tendencies of state socialism, exaggerated bureaucratism and stifling taxation, were counts in the indictment. The Labour minister of finance, Pieter Liefstinck, was a favourite butt of criticism, although he turned for the better which the country's financial situation had taken made some of it less effective. Meanwhile the other chief member of the governing coalition, the Catholic People's party, was obviously subject to severe internal tension. Conservative elements hinted that other partners might be found in place of Labour; this tendency toward the right caused a good deal of alarm among the party's left wing and Catholic workmen.

The result of the election afforded clear proof that thousands of the latter were so much disgruntled as to desert the party and to vote on the Labour party list. The proportional representation system does not allow very sharp changes and those that occurred, although seemingly small, came as a great surprise. For the Labour party the result was gratifying: in a house of 100 it increased its seats from 27 to 30. The wide popularity of the premier, Willem Drees, was no doubt a factor in the success, but its most important aspect seemed to be that it could be regarded as the first substantial realization of the "break-through," advocated and predicted by Labour since World War II, or, in other words, of a realignment of parties on issues of practical politics instead of religious principles.

According to custom the cabinet had resigned before the result was known. The formation of a new cabinet proved a lengthy and wearisome business. The Catholic leaders insisted on having more parties included and a tussle about the redistribution of portfolios ensued. On Sept. 1 a new Drees cabinet was announced with himself as prime minister, L. J. M. Beel (Catholic) as minister of the interior, Cornelis Staf (Christian Historical) as minister of defense and J. A. van de Kieft (Labour) as minister of finance. An innovation was the appointment of two foreign ministers in the persons of J. W. Beyen (nonparty) and J. M. A. H. Luns (Catholic).

The favourable trend in the country's financial and economic affairs that had first manifested itself about the middle of 1951 continued during 1952. Both the movement of prices in the international market and government measures taken in 1951 were responsible for a considerable improvement of the country's balance of payment. While in the first seven months of 1951 only 66% of imports were covered by exports, the proportion in the same period of 1952 was 92%. The stock of gold and foreign currency, which amounted to 895,000,000 guilders in July 1951, reached 2,926,000,000 guilders in July 1952. The deficit in the European Payments union was not only wiped out, but the Netherlands became a considerable creditor. The dollar shortage, however, remained. The improved financial position was one factor in making the Netherlands bank decide (Jan. 22) to lower the bank rate from 4% to 3½%. The deflationary policy was partly responsible for an increase of unemployment (165,824 unemployed in Jan. 1952).

In January negotiations were started at The Hague between the Netherlands government and delegates of the Indonesian republic about the Netherlands-Indonesian union (dating from the Round Table conference of 1949) and the status of western New Guinea. In regard to the first question, the Dutch government declared its readiness to replace the union relationship by a complex of agreements in international law. In regard to New Guinea it proved impossible to reach a compromise so that the negotiations were broken off in February. (See also INDONESIA.)

SPRING FLOWER FESTIVAL in 1952 in Bloemendaal, Neth. The annual parade of colourful and scented tableaux follows the cutting of flowers which is done soon after blooming time to safeguard life in the young bulbs, a major Dutch export

The improvement of the Dutch balance of payments removed one of the obstacles that stood in the way of a complete economic union of Belgium, the Netherlands and Luxembourg (the Benelux economic union). New difficulties were created when certain interests in Belgium began to complain with increasing violence of the competition they were suffering from Dutch imports. Because the level of wages and prices was lower in the Netherlands, various Dutch products were cheaper than the Belgian equivalents. A clamour arose for measures to protect Belgian products if the Dutch price level were maintained. A raising of that level might, however, jeopardize the Dutch trading position in the international market.

In the negotiations held in Paris for the creation of a European Defense Community it was the policy of D. U. Stikker, Liberal minister of foreign affairs, to advocate a close integration of the projected European army into the wider NATO (North Atlantic Treaty organization) framework. He wished to see the Federal Republic of Germany included somehow in NATO. On May 27 he put his signature to the agreement for the creation of the European Defense Community. According to his statement in the second chamber on Feb. 7, the government had come to realize that it was hardly possible to proceed further on the road of functional organization without accepting political federation. In his view the European Defense Community was already to be considered as a partial federation. Since a European federation seemed the logical and inevitable development, the government was determined to accept the situation and energetically to promote the project.

In April Queen Juliana and her consort paid an official visit to the United States, and on April 3 the queen addressed the U.S. congress. (See also KOREAN WAR; NETHERLANDS ANTILLES; NETHERLANDS NEW GUINEA; NORTH ATLANTIC TREATY ORGANIZATION; SURINAM.) (P. GL.)

Education.—Schools (1949-50): government infant 294, pupils 48,208, teachers 1,260; private infant 2,720, pupils 267,478, teachers 6,245; government elementary 2,401, pupils 319,680, teachers 9,685; private elementary 4,697, pupils 860,478, teachers 24,939; day secondary 1,281, pupils 209,818, teachers 11,614; evening secondary 126, pupils 15,905, teachers 1,095; agricultural 236, pupils 50,380; technical and housewifery 892, pupils 236,278, teachers 11,405. Teachers' training colleges 89, students 10,545, lecturers 1,152. Universities: state 4, students 17,928, professors and lecturers 684; technical 4, students 8,367, professors and lecturers 274; free 2, students 2,271, professors and lecturers 99.

Finance and Banking.—Budget: (1952 est.) revenue 4,701,000,000 guilders, expenditure 3,801,000,000 guilders; (1953 est.) revenue 5,124,000,000 guilders, expenditure 5,616,000,000 guilders. National debt (June 1950): 26,704,000,000 guilders. Currency circulation (June 1952):

2,975,000,000 guilders. Bank deposits (Aug. 1952): 3,993,000,000 guilders. Gold reserve and foreign exchange of Central bank (July 1952): U.S. \$764,000,000. Monetary unit: guilder or florin, with an exchange rate of 10.64 guilders to the pound sterling and 3.805 guilders to the U.S. dollar.

Foreign Trade.—(1951) Imports 9,673,000,000 guilders; exports 7,431,000,000 guilders. Main sources of imports (1951): Belgium-Luxembourg 18%; Germany 12%; U.S. 11%; U.K. 8%. Main destinations of exports: U.K. 16%; Belgium-Luxembourg 15%; Germany 14%; Indonesia 5%. Main imports: textiles, fibres and manufactures 13%; coal, petroleum and products 11%; iron and steel manufactures 9%; grain 6%. Main domestic exports: milk, dairy products and eggs 12%; textile fabrics including garments 8%; machinery and apparatus 8%; chemicals and related products 7%.

Transport and Communications.—Roads (Jan. 1950): main 1,724 mi.; secondary 2,694 mi.; third class and unclassified 10,713 mi. Licensed motor vehicles (Dec. 1950): cars 138,625, commercial vehicles 88,126. Railways (1950): 1,925 mi., of which 555 mi. were electrified; passenger-miles 3,802,000,000; freight, tonnage carried 21,200,000; ton-miles 1,870,000,000. Inland waterways: 4,335 mi., of which c. 1,000 mi. were for ships of more than 1,000 gross tons. Shipping: merchant vessels of 100 gross tons and more (July 1951) 1,602; total tonnage 3,237,333. Air transport (1950): passenger-miles 469,000,000; freight ton-miles 19,500,000. Telephones (1951): 781,678. Radio receiving sets (1951): 1,600,000.

Agriculture and Fisheries.—Main crops (metric tons, 1951): wheat 270,000; rye 458,000; barley 210,000; oats 491,000; potatoes 3,796,000; sugar (raw value) 366,000; rapeseed 21,000; linseed 20,000; dry peas 76,000; broad beans 9,000; flax fibre 25,400. Livestock (May 1951): cattle 2,882,000; pigs 1,947,000; horses used in agriculture (May 1950) 252,000; sheep 371,000; poultry 25,460,000. Meat production (metric tons, 1951): 382,000, including beef and veal 166,000, pork 212,000. Dairy production (metric tons, 1951): milk delivered 45,213,000 hl.; butter 84,600; cheese 140,400. Fisheries: total catch (1951) 280,000 metric tons; herring exports (1950) 33,860 metric tons, valued at 17,500,000 guilders.

Industry.—Industrial establishments (1948): 115,580; persons employed 1,227,297. Total working population (1950): 3,953,000. Fuel and power (1951): coal 12,420,000 metric tons; lignite 252,000 metric tons; crude oil 714,000 metric tons; manufactured gas 1,680,000,000 cu.m.; electricity 5,796,000,000 kw.hr. Raw materials (metric tons, 1951): pig iron 524,400; crude steel 552,000; zinc (smelter) 22,600; aluminum (primary metal, 1950) 10,800; tin, metal 21,400; salt (1950) 419,000. Manufactured goods (metric tons 1951): cement 702,200; cotton yarn 62,300; wool yarn 21,100; rayon filament yarn 24,400; rayon staple fibre 11,900; paper (1950) 325,000; leather footwear (1949) 18,500,000 pairs. New dwellings completed (1951): 58,668.

Netherlands Antilles.

Six islands in the West Indies constitute the Netherlands Antilles. Three small islands, on the northern edge of the Caribbean sea near Puerto Rico, are Saba (5 sq.mi.), St. Eustatius (7 sq.mi.) and the southern half of St. Martin (17 sq.mi.). The three principal islands lie 500 mi. to the southwest, off the coast of Venezuela. They are Curaçao (210 sq.mi.), Aruba (69 sq.mi.) and Bonaire (95 sq.mi.). The population of all six islands was estimated in 1951 at about 166,000, and that of the capital city, Willemstad, on Curaçao, at about 48,000. The official language is Dutch, but a mixture of Dutch, Spanish, English and other tongues, known as Papiamentu, is equally widespread.

During 1952 the governor, appointed by the crown, was A. A. M. Struycken. The prime minister was M. F. da Costa Gomez.

History.—All citizens of the Netherlands Antilles are subjects of the crown of the Netherlands, with the same rights and duties as those resident in the mother country. Constitutional relationships between the parliament, set up in 1950, and the imperial government had not been settled in 1952. Repeated conferences took place during 1952, as they had in 1951, in the ministry of overseas territories in The Hague.

The effort to bring about the organization of labour employed in the oil refineries on Curaçao and Aruba, so as to exert more influence on the policy of the companies, continued during 1952, and late in the year the Oil Workers International union of the United States consented to send one of its officials to look into the situation.

The future economic relations of the Netherlands Antilles with Venezuela continued to preoccupy the authorities both at The Hague and at Willemstad. Early in 1952 a counsellor for Caribbean affairs was appointed to the Dutch embassy in Caracas, Venez., and a person selected by the cabinet at

Willemstad was designated to the post, becoming virtually the first diplomatic representative of the Antilles in Venezuela.

(C. E. Mc.)

Education.—In 1951 there were 48 elementary schools with 15,912 pupils, 31 higher elementary schools with 11,765 pupils and 3 secondary schools with 417 students.

Finance.—The monetary unit is the Netherlands Antilles guilder or florin, valued at \$0.530264 U.S. currency during 1952. The budget for the fiscal year 1951 estimated expenditure at 55,273,236 f. and revenue at 55,362,515 f. Actual revenue in 1950 amounted to 60,588,122 f. The public debt on Jan. 1, 1952, was 8,450,000 f.; notes in circulation 35,217,000 f.; gold reserves 35,217,000 f.

Trade and Communications.—Exports in 1951 totalled 1,324,800,000 f., imports were 1,447,200,000 f. More than 98% of the exports consisted of petroleum products and about 80% of the imports consisted of crude petroleum, principally from Venezuela. The U.S. supplied about two-thirds of the nonpetroleum imports.

The highway mileages of the islands of the Netherlands Antilles in 1950 were as follows: Curaçao, 210; Aruba, 150; Bonaire, 32.5; St. Martin, 17; Saba, 4.5 and St. Eustatius, 2.5. On Jan. 1, 1951, 5,008 automobiles and 1,712 trucks were in use on Curaçao and 3,379 automobiles and 1,063 trucks on Aruba. On Jan. 1, 1952, there were 6,456 telephones, of which 4,117 were on Curaçao and 2,145 on Aruba.

Manufactures.—The three refineries—Curaçaoische Petroleum Industrie Maatschappij, N.V. (Shell) on Curaçao and Lago Oil and Transport Co. (Standard Oil Company of New Jersey) and the Eagle Oil Co. (Shell) on Aruba—produced 39,300,000 metric tons of refined petroleum products in 1950, including 29,300,000 tons of heavy oils, 5,500,000 tons of gasoline and 2,100,000 tons of diesel oil.

(J. W. Mw.)

Netherlands New Guinea.

The western part of this second and largest island of the world, with smaller adjacent islands, forms part of the territory of the kingdom of the Netherlands. Area: c. 152,100 sq.mi. Pop.: c. 700,000 of whom (1951 est.) 339,787 were in districts under regular Dutch administration. Europeans numbered 9,869; Indonesians, 11,013; other Asiatics (mainly Chinese) 3,027. The Papuans form the principal native stock. Principal towns: Hollandia (cap., pop. 1951 est., 32,059), Manokwari, Sorong and Merauke. Governor in 1952, S. L. J. van Waardenburg.

History.—The budgets for 1950 through 1952 were finally submitted to parliament in the Netherlands for approval, together with a bill covering a 40,000,000 florin New Guinea development loan. The 1952 budget called for ordinary expenditure of 59,000,000 florins; the capital budget amounted to 8,533,000 florins. The annual report on the administration in 1951 was presented to the United Nations in August.

Under the auspices of the South Pacific commission (representing the joint interests in the area of Australia, Great Britain, France, the Netherlands and the United States) an experimental community project was started in the Nimboran plain, south of Hollandia; it aimed at raising the economic level of the Papuan population through adapting them to agriculture on the basis of co-operation by several clans. The same commission sponsored an investigation into the depopulation process, threatening New Guinea as it did other primitive societies exposed to contact with modern civilization. In June a geological and mining reconnaissance expedition under the auspices of the Delft Institute of Technology (the Netherlands) started operations in the Cyclops range of mountains on the north coast. The New Guinea Petroleum company continued to exploit the Klamono field on the western tip of the island (approx. 5,000 bbl. a day) and prepared the discovered fields near Mogoy and Wasian, farther east near the MacCluer gulf, for regular development. Apart from crude oil, exports of products such as copra and resins marketed by the indigenous population also began to rise.

The general picture thus showed increasing activity, but the administration and the impetus toward development of this primitive territory continued to be hampered to some extent by uncertainties regarding the future status of New Guinea, in view of Indonesian annexation ambitions (*see* INDONESIA). In the Netherlands, on the other hand, determination to carry on the task, based on article 73 of the U.N. charter, and to make adequate finances from Dutch treasury funds available for a long-

term development plan was becoming more positive. After a new cabinet had taken office in the Netherlands these intentions were confirmed in the speech with which the queen opened the sessions of parliament on Sept. 16. (W. G. P.)

Nevada. A state of the mountain group of western states, Nevada was the 36th state to be admitted to the Union, on Oct. 31, 1864; it is popularly called the "Sagebrush state" or the "Silver state." Land area 109,789 sq.mi.; water area 751 sq.mi. Pop. (1950 census) 160,083, a gain of 45.2% since 1940. Rural population 68,458; urban 91,625; white 149,707; nonwhite 10,176. The principal cities are: Carson City, the capital, 3,082; Reno, 32,497; Las Vegas, 24,624; Sparks, 8,203; Elko 5,393; Ely, 3,558.

History.—A number of important events occurred in Nevada during 1952. The huge Basic Magnesium project at Henderson, Nev., passed from state control to private ownership. The atomic bomb tests in southern Nevada attracted nation-wide attention. Through the efforts of the state's Colorado river commission, contracts were signed for the purchase of power generated at the great Shasta dam. The primary election held in September resulted in a number of unexpected nominations, including the nomination of Thomas B. Mechling (Dem.) for U.S. senator, and Clifton Young (Rep.) for member of the house of representatives.

On Jan. 1, 1952, elected officers were: governor, Charles H. Russell; lieutenant governor, Clifford A. Jones; secretary of state, John Koontz; state controller, Peter Merialdo; state treasurer, Dan W. Franks; surveyor general, Louis D. Ferrari; inspector of mines, Mervin J. Gallagher; superintendent of state printing, J. A. McCarthy; clerk of the supreme court, Ned A. Turner; superintendent of public instruction, Glenn A. Duncan; attorney general, W. T. Mathews.

Education.—In June 1952 Nevada had 178 elementary schools with a total enrolment of 24,766; teachers numbered 911. High schools totalled 37, with an enrolment of 7,144 and a staff of 341 teachers. Kindergarten enrolment was 2,546 in 16 kindergartens with 40 teachers. Total school population was 34,456. Average annual salaries paid to high school teachers was \$3,650, to elementary teachers \$3,231 and to kindergarten teachers \$3,310. State-wide expenditures for elementary and secondary education, all schools, was \$11,818,032 for the year, of which \$2,563,077 was provided as state aid.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the fiscal year ended June 30, 1952, \$668,488 was expended by the state health and welfare departments. In addition, \$1,912,316 was expended for old-age assistance benefits to 2,755 persons, who received an average monthly amount of \$54.91. On June 30, 1952, the state prison had 287 men and 5 women inmates; total expenditures for the fiscal year were \$285,643. The Nevada school of industry had 31 boys and 3 girls under school control; total expenditures for the fiscal year were \$71,725. The state hospital for mentally ill persons had 392 patients in average daily residence during the fiscal year; expenditures were \$331,474. The state children's home had 48 boy and 43 girl residents during the fiscal year, and the cost to the state was \$185,627.

Communications.—During the fiscal year ended June 30, 1952, the total disbursement for highways was \$8,078,124. There were approximately 6,174 mi. of road in the designated state highway system, including secondary roads. Railroad mileage totalled 1,646 in 1952. Motor vehicle registrations in 1951 totalled 89,845, of which 87,617 were privately owned and 2,228 publicly owned. There were 385 registered aircraft and 67 established airports in 1951.

Banking and Finance.—On July 1, 1952, there were 31 individual banking institutions in the state, of which 23 were branches, 5 were national banks and 3 were state banks. The resources of Nevada banks totalled \$219,020,757, and deposits were listed at \$204,902,828.

The credits of the state for the fiscal year ended June 30, 1952, amounted to \$33,630,015; the debits to \$32,782,419. There was a

Table I.—Principal Crops of Nevada

Crop	Indicated 1952	1951	Average 1941-50
Barley, bu.	925,000	816,000	762,000
Potatoes, bu.	416,000	364,000	504,000
Wheat, bu.	581,000	502,000	482,000
Hay, ton	651,000	585,000	600,000

NEWS REPORTERS, cameramen and guests scattered over the hill called News Nob, 10 mi. from an atomic bomb target at Yucca Flat, Nev., before witnessing the first nonsecret atomic explosion, in April 1952

treasury balance of \$10,894,910. The state had bonds outstanding in the amount of \$1,000,000 for the construction of office and institutional buildings. The par value of bonds and securities held by the state totalled \$8,603,377, and they produced an income of \$185,971. Nevada has no sales taxes, income taxes or inheritance taxes. A 2% tax on gambling netted the state \$1,859,129, and a state property tax of 69 cents on each \$100 of valuation netted \$2,316,789. The total assessed valuation of the state for 1952 was \$366,508,300.

Agriculture.—The total farm value of the principal crops in 1950 was \$17,256,000; the total acreage harvested was 511,000. In 1950 the cash income from crops sold was \$5,513,000; from livestock sold, \$42,650,000.

Manufacturing.—Manufacturing in Nevada is limited in scope and production. In 1947 there were 126 industrial establishments in the state, employing approximately 2,667 persons and paying approximately \$8,409,000 in wages for the year. The value added by manufacturing was approximately \$27,777,000. Expenditures for new plants and equipment totalled \$2,959,000 in 1947. By 1952 chemicals and allied products were being manufactured in ever-increasing quantities at the Basic Magnesium project at Henderson, Nev. (J. E. SPR.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Nevada in 1949 and 1950, listing all

Table II.—Mineral Production of Nevada

(In short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Barite	48,000	\$ 269,000	71,000	\$ 417,000
Copper	53,000	21,869,000	38,000	14,995,000
Gold (oz.)	178,000	6,246,000	130,000	4,564,000
Gypsum	605,000	1,614,000	495,000	1,348,000
Lead	9,000	2,540,000	11,000	3,358,000
Mercury (flasks, 76 lb.)	1,000	55,000	4,000	331,000
Sand and gravel	2,617,000	2,253,000	1,347,000	1,212,000
Silver (oz.)	1,537,000	1,391,000	1,800,000	1,629,000
Stone	274,000	270,000	519,000	669,000
Talc	8,000	171,000	9,000	147,000
Tungsten concentrate (60% WO ₃)	1,000	*	1,000	*
Zinc	22,000	6,136,000	20,000	5,070,000
Other minerals		5,685,000		3,632,000
Total		\$48,499,000		\$37,372,000

*Value included with other minerals.

items whose value exceeded \$100,000. Data for 1951 were not yet available. Nevada ranks 2nd among the states in the production of diatomite and magnesite, and stands 30th in value of mineral output, with 0.41% of the U.S. total.

New Brunswick. Second largest of the four Atlantic provinces of Canada, New Brunswick entered the confederation in 1867. Area: 27,985 sq.mi. Pop. (1951)

515,697.

History.—Liberal premier John B. McNair called the final session of the 41st provincial legislature on Feb. 19, 1952. The agenda included more than 150 separate bills completing a three-year revision of the provincial statutes. The 1947 federal-provincial five-year tax agreement was renewed. In September McNair called an election with nearly a year of his term still to run. The returns were surprising: from 47 seats in the 1948 election, the Liberals dropped to 16; from 5 seats the Conservatives rose to 36. Defeated largely because of their 4% sales tax to finance education and social services, imposed in 1950, the 17-year rule of the Liberals had ended; Conservative Hugh John Flemming was named premier.

Education.—Latest available statistics for provincially controlled schools were for 1948: total enrolment, 98,331; average daily attendance, 81,057; teachers, 3,019; total revenue, \$7,562,848.

Finance.—Following the 1951 change-over in the province's fiscal year, receipts and expenditures were available only for the April 1-Dec. 31, 1951, period. Receipts were \$38,176,652; expenditures were \$33,586,602. Main sources of revenue: federal grants, \$9,900,000; gasoline tax and motor vehicle fees, \$7,900,000; social service and education tax, \$5,600,000; liquor commission, \$4,600,000. Main expenditures: public works, \$7,300,000; old-age pensions, \$5,900,000; education, \$4,400,000; municipal subsidies, \$1,500,000.

Agriculture.—The biggest news on the agricultural front in 1952 was the potato boom, with March prices rising to as high as \$8.50 per barrel, which was reminiscent of the all-time high of \$10 per barrel during World War I. However, the total returns to farmers were limited by the fact that the 1951 crop acreage had been decreased by 10% because of poor prospects at that time.

Forestry.—Producers shipped 2,000,000 cords of pulpwood during the 1948-51 period, which was exceeded among the provinces only by Ontario. After a slump, the pitprop industry revived during the winter of 1951-52. A rapid spread of spruce budworm threatened to destroy more than 4,000 sq.mi. of heavy forest. Intense aerial spraying was undertaken to halt the infestation.

Fisheries.—Statistics of 1951 revealed that the provincial fishing industry had reached a \$22,000,000-per-year status (compared with \$5,000,000 in 1938).

Minerals.—Mineral production in 1951 passed the \$10,500,000 mark for the first time in provincial development. The major factor was coal production of 651,100 tons worth \$4,874,000. The search for base metals was accelerated by the presence of 20 companies actively prospecting. (C. Cy.)

New Caledonia: see PACIFIC ISLANDS, FRENCH.

Newfoundland and Labrador. A province of Canada, Newfoundland joined the confederation in 1949. Area: Newfoundland Island, 42,734 sq.mi.; Labrador, c. 112,000 sq.mi. Pop.: Newfoundland (1951) 361,416; Labrador (1951) 7,890.

History.—Economic development continued to hold the centre of the provincial stage during 1952, with the Liberal government of J. R. Smallwood running into increasing criticism of its projects. Some of the criticism took political shape when the Liberals lost the ridings of Ferryland and St. John's West in by-elections to the Conservatives, who increased their legislative representation from four to six in the 28-seat house. Despite this evidence of opposition, Smallwood continued to press his economic development program by the use of provincial surpluses: he revealed that in 1951 Newfoundland salaries and wages totalled \$150,000,000 against an estimated \$200,000,000 for 1952. To spur mineral development the premier created a department of mines separate from the department of natural resources.

The provincial economy was improved by the \$200,000,000 spent by the United States government on its military bases at Fort Pepperrell, Hamon and Argentia.

Education.—School attendance increased from 75,006 in 1949 to 84,000 for the 1951-52 school year. The provincial Memorial university began operating full scale.

Transportation.—Gander airport was improved by the creation of longer runways and more living and administrative accommodation. The Canadian National railways spent \$2,000,000 to improve the Newfoundland section of its system, but the reduced travel rates so stimulated business that passenger service was hard put to cope with it. Although the federal government had placed \$1,000,000 on account with the provincial government for construction of the island section of the trans-Canada highway, little work was done.

Finance.—The provincial treasurer announced a \$1,300,000 surplus on current account at the end of March 31, 1952, fiscal year, and budgeted for a \$6,300,000 surplus on current account for 1952-53. He also announced a \$15,500,000 surplus in the capital account on March 31, 1952, in spite of having spent \$11,000,000 on capital expansions during the period.

Fisheries.—Because of low fish prices, better paying employment ashore, and stiff competition from mechanized fishing trawlers, the old-time Newfoundland dorymen were decreasing in numbers. In 1948 there were 28,000 such fishermen; in 1952 there were only an estimated 17,000. The island fishing industry was forced to modernize, and was turning from traditionally hand-salted cod to fresh-frozen cod.

Industry.—By 1952 there were 11 government-sponsored industries in operation, producing such things as cement, gypsum board, birch flooring, plywood, machinery, leather, furniture, textiles, optical instruments and fish oil.

Minerals.—Spurred by \$33,000,000 of general mineral production in 1951, and by knowledge of rich deposits already unearthed, ten Canadian and U.S. mineral-exploration companies spent \$2,600,000 on prospecting; they discovered new potential mines of asbestos, gold, nickel, titanium and zinc. The world's biggest ore conveyor went into operation at the Wabana iron mine on Bell Island.

New Guinea: see NETHERLANDS NEW GUINEA; PAPUA-NEW GUINEA; TRUST TERRITORIES.

New Hampshire. One of the New England states of the United States and one of the original group of 13, New Hampshire is popularly known as the "Granite state." Area: 9,304 sq.mi., including 287 sq.mi. of inland water. Population (1950 census) was 533,242, representing a gain of 41,718 or 8.5% over the population for 1940. In 1950, 306,806 persons, or 57.5% resided in urban territory and 226,436, or 42.5% in rural territory. There were 532,275 whites and 967 nonwhites, and 58,134 foreign-born whites. Capital: Concord, with pop. (1950) of 27,988. Other cities: Manchester, 82,732; Nashua, 34,669; Portsmouth, 18,830; Berlin, 16,615; Dover, 15,874; and Keene, 15,638.

History.—There was no session of the legislature in 1952. A major development was the decision of the U.S. government to proceed with the construction of the Portsmouth-Newington jet bomber base, the site for which had been the subject of a bitter dispute involving strong local opposition. It was estimated that the construction of this base would bring in 1,000 officers and 6,000 airmen and that the over-all personnel would mean an increase of the population of New Hampshire by 2½%.

By May, the New Hampshire Business Development corporation, established by the legislature in 1951, had been organized. Its purpose was to facilitate the granting of industrial loans, and 72 corporations subscribed \$65,000 in working capital and 50 lending agencies agreed to underwrite loans up to a total of \$715,000.

State officers in 1952 were: governor, Sherman Adams; secretary of state, Enoch D. Fuller; state treasurer, Winfield J. Phillips; adjutant general, Charles F. Bowen; attorney general, Gordon M. Tiffany; commissioner of education, Hilton C. Buley; commissioner of agriculture, Perley I. Fitts. Senate president Blaylock Atherton was named acting governor for a period of three months beginning Aug. 1, to enable Governor Adams to participate actively in Gen. Dwight D. Eisenhower's campaign for the presidency.

Education.—In 1951-52 there were 75,862 pupils enrolled in 511 schools in the state, the distribution being as follows: 1,046 pupils enrolled in rural schools; 2,975 pupils in public kindergarten classes; 48,034 pupils enrolled in elementary schools and in the elementary grades in combined elementary-secondary schools; 5,125 pupils in grades seven and eight in approved junior high schools; and 18,682 pupils in the ninth grade of approved junior high schools and in senior high schools. There were 3,142 full-time teachers, including 1,859 elementary, 1,237 secondary and 46 not classified as to teaching level. Total payments covering expenditures of school districts for the year ending June 30, 1951, were \$19,191,773.34, including \$855,862.62 for general expenses; \$5,827,161.69 for high schools, and \$12,508,749.03 for elementary schools. In 1949-50 Catholic parochial elementary schools had a total registration of 19,306, while other private elementary schools had a registration of 683. The total number of students enrolled in approved public academies, accredited secondary schools and other private secondary schools in the same year was 6,440.

Other state educational institutions were the University of New Hampshire at Durham; Keene Teachers college at Keene; and Plymouth Teachers college at Plymouth.

Social Insurance and Assistance, Public Welfare and Related Programs.—As of July 1952 the numbers and categories of cases receiving public assistance under the Social Security act were as follows: old-age assistance, 6,769 for the month, with expenditures of \$295,335; old-age aliens, 43, with expenditures of \$8,111; aid to dependent children, 1,290 families, representing 3,208 children, with expenditures of \$129,919; aid to needy blind, 299 cases, with expenditures of \$14,758; aid to permanently and totally disabled, 24 cases, with expenditures of \$1,278. Total obligations for direct relief and expenditures for public assistance were \$558,412 for July 1952, compared with \$667,441 for July 1951 and \$703,313 for Jan. 1952. In the fiscal year 1950 New Hampshire received \$3,085,000 in federal grants for public assistance, while in the same year payments by the state to recipients of public assistance amounted to \$6,645,000. The sum of \$5,139,000 was collected in contributions for unemployment insurance in 1950 and \$7,765,000 paid in benefits under state laws. Funds available for benefits at the close of 1950 amounted to \$19,863,000. In the week ending May 24, 1952, the state had 10,500 unemployed compared with 9,800 a year previously. The net appropriation for the operation of the state prison at Concord for the fiscal year ending June 30, 1953, was \$280,821.86; and for the Industrial School for Committed Minors at Manchester, \$232,520.75.

Communications.—At the end of 1949 there were 12,511 mi. of rural roads in New Hampshire, including highways under state, local and federal control. Disbursements from state highway funds for 1949 amounted to \$17,659,000. In 1949 there were 937 mi. of steam railways owned within the state compared with 1,002 mi. in 1940. At the close of 1949 there were approximately 36,000 business and 105,000 residential telephones in operation.

Banking and Finance.—As of March 31, 1952, there were in New Hampshire 51 national banks with deposits of \$192,208,000 and resources of \$215,885,000, compared with 51 banks with deposits and resources, respectively, on June 30, 1951, of \$185,182,000 and \$208,577,000. Fifty-seven state-chartered banks had on June 30, 1952, deposits of \$382,515,501 and resources of \$438,081,894, compared with 57 institutions reporting deposits and resources, respectively, of \$346,486,889 and \$413,532,250 on June 30, 1951. There were 24 state-chartered building and loan associations with assets of \$31,505,044, compared with 24 institutions with assets of \$28,248,416 for the year 1951. There were two federal savings and loan associations with combined assets of \$33,567,045. As of June 30, 1951, state-chartered savings banks and savings departments of trust companies reported deposits of \$344,728,489.47 which was \$204,079.93 less than the amount for the preceding year, 1950, which had marked an all-time high.

Cash receipts of the state treasury department for the fiscal year ended June 30, 1952, were \$88,863,703.98; cash disbursements, \$88,302,719.86. Cash balance, June 30, 1952, was \$4,996,265.24; cash balance, June 30, 1951, was \$4,435,281.12. The total net bond and note indebtedness on June 30, 1952, was \$22,065,803.13.

Agriculture.—The estimated acreage from which crops were harvested or hay cut, or which was planted in orchards, amounted to 383,000 in 1949. Cash receipts from farm marketings in 1950 amounted to \$64,148,000 with an additional \$554,000 in government payments. Value of farm products consumed at home amounted to \$5,785,000, thus bringing the total farm income to \$70,487,000.

Table I.—Principal Crops of New Hampshire

Crop	Indicated 1952	1951	Average 1941-50
Corn, bu.	598,000	602,000	551,000
Oats, bu.	148,000	180,000	233,000
Hay, tons	409,000	403,000	416,000
Potatoes, bu.	943,000	975,000	1,186,000
Apples, bu. (commercial)	600,000	1,216,000	857,000

Manufacturing.—There were estimated to be about 1,075 manufacturing establishments in New Hampshire as of Sept. 1950, and approximately 83,000 persons employed as of Feb. 1951. A 1951 estimate reported that manufacturing pay rolls would probably exceed \$400,000,000 in that year. The estimated value added by manufacture in 1950 was \$306,932,000. The principal categories of manufactures were textiles, lumber products, paper, leather and leather products, and machinery. (W. E. Ss.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in New Hampshire in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available.

Table II.—Mineral Production of New Hampshire

Mineral	Quantity	Value	Quantity	Value
	1950		1949	
Sand and gravel (short tons)	1,713,000	\$ 226,000	2,001,000	\$ 237,000
Stone (short tons)	16,000	384,000	7,000	381,000
Other minerals		1,101,000		766,000
Total		\$1,711,000		\$1,384,000

able. New Hampshire ranks 46th among the states in the value of mineral output, with 0.01% of the U.S. total.

New Hebrides. This Anglo-French condominium consists of a group of about 30 islands and many islets in the western Pacific. Area: 4,633 sq.mi. Pop. (1946 census, partly est. native pop. only): 45,000; (Dec. 1949 est.,

nonnative pop.) British 436, French 1,230, Asiatics 1,828; (1951 est., total pop.) 49,000. Native population is Melanesian with Polynesian admixture. Religion: mainly pagan. Capital, Vila (pop. 1,200). Resident commissioners in 1952: British, H. J. M. Flaxman; French, P. Anthonioz.

History.—The New Hebrides suffered severely from a hurricane early in Dec. 1951: the death toll was 110, about 4,000 people were made homeless and many small craft were wrecked. The condominium estimates for 1952 made provision for a program of port, road and bridge improvement, but the heavy demands of reconstruction after the hurricane absorbed most of the available labour, and it seemed improbable that the program could be started before the end of the year. (K. G. B.)

Education.—Government primary schools (1951): two British, three aided Melanesian mission; various other mission schools.

Finance and Trade.—Currency: sterling and French. Budget (1952 est.): revenue £363,000; expenditure £324,000. Foreign trade (1950): imports £528,000; exports £1,419,000. Principal exports: copra, kauri pine.

New Jersey. New Jersey, the "Garden state," is one of the northeastern states of the United States bordering the Atlantic ocean. It was the third state to enter the union, approving the constitution on Dec. 18, 1787. It has an area of 7,836 sq.mi. of which 314 sq.mi. are inland water. The population in 1950 numbered 4,835,329, of which 4,186,207, or 86.6% was urban and 94.3% was white. The population of the capital, Trenton, was 128,009 in 1950; other large cities were Newark, 438,776; Jersey City, 299,017; Paterson, 139,336; Camden, 124,555; and Elizabeth, 112,817.

History.—Some of the more important measures approved by the legislature in 1952 were: a package of five related laws designed to meet the problem of the uninsured and financially irresponsible motorist, including a Motor Vehicle Security Responsibility law and an Unsatisfied Claim and Judgment Fund law; an increase in maximum unemployment and disability benefits from \$26 to \$30 per week; a series of laws which strengthened the existing narcotic legislation; and an "equal pay for equal work" law designed to eliminate discrimination against women in salaries. During the year the legislature created a number of new governmental agencies, including: an air safety commission with authority to investigate the safety of airports and aircraft at any time; a commission to promulgate a state building construction code and supervise its enforcement by municipalities and state agencies; a three-member state highway authority in the state highway department to finance, construct, operate and regulate "modern express highway" projects; a state law enforcement council to provide for continuing examination of law enforcement; and a commission to study transit facilities used by New Jersey commuters.

The chief officers during 1952 were Alfred E. Driscoll, governor; Lloyd B. Marsh, secretary of state; Theodore Parsons, attorney general; Walter T. Margetts, Jr., state treasurer; and Arthur T. Vanderbilt, chief justice.

Education.—Public school day enrolment totalled 562,280 for grades 1 through 8 in June 1952, enrolment for grades 9 to 12 was 157,742 and for special classes 6,704. The number of day school teachers was estimated at 29,266. The 4 universities, 9 liberal arts colleges, 8 professional and technical colleges and 10 junior colleges had a combined enrolment of 23,417 full-time and 16,636 part-time students in March 1952. The 6 state teachers' colleges had a total enrolment of 6,514, while the 40 professional and technical schools had 1,318 full-time and 3,116 part-time students. The state commissioner of education was Frederick M. Raubinger.

Social Insurance and Assistance, Public Welfare and Related Programs.—In July 1952 the state's welfare system cared for 13,476 patients in institutions for the mentally ill, while the county hospitals cared for an additional 6,410. The state institutions for the mentally deficient and epileptic contained 6,354 patients, tuberculosis sanatoria had 2,634 patients, 643 pupils were in training schools for juvenile delinquents and 218 veterans were in soldiers' homes. Old-age assistance recipients numbered 22,003 in July 1952. The number of children assisted by the board of child welfare totalled 20,177; 821 received blind assistance and the number of general assistance recipients was 13,748. The state prison and three reformatories for adult offenders contained 3,875

Table I.—Principal Crops of New Jersey

	Indicated 1952	1951	Average 1941-50
Corn, bu.	10,476,000	9,712,000	7,994,000

Table II.—Principal Industries of New Jersey

Industry	1950	1949
Chemicals and allied products	\$915,509,000	\$755,787,000
Food and kindred products	479,816,000	433,500,000
Electrical machinery	447,512,000	377,686,000
Machinery (except electrical)	350,916,000	319,351,000
Textile mill products	336,136,000	333,832,000
Fabricated metal products	311,355,000	262,085,000
Transportation equipment	296,498,000	226,326,000
Primary metal products	242,369,000	187,808,000
Apparel and related products	235,365,000	270,754,000
Stone, clay and glass products	189,679,000	136,993,000
Petroleum and coal products	186,828,000	128,990,000

inmates. Benefit payments to the jobless totalled \$5,164,357 during July 1952.

Communications.—The total highway mileage of New Jersey on Jan. 1, 1952, was 28,467, of which 6,100 mi. were unimproved. State and federal funds disbursed for roads totalled \$49,093,064 during the fiscal year 1950-51. Motor vehicle registrations totalled 1,698,138 in 1951. The 23 railroads operating within the state had a track mileage of 2,950 and a line mileage of 1,999 on Dec. 31, 1951. Civil, commercial and municipal airports numbered 77 in 1951.

Banking and Finance.—Deposits of the 139 institutions under the supervision of the state department of banking and insurance amounted to \$3,073,837,000 on June 30, 1952, an increase of \$132,644,000 over the previous June 30. The deposits of the 116 commercial institutions were \$2,362,293,000, an increase of 2.5%, while the deposits in the 23 savings banks showed \$711,544,000, an increase of 12%. The number of national banks in New Jersey numbered 201 on June 30, 1952, with total assets of \$2,859,235,000. The 466 state-chartered savings and loan associations had assets of \$721,352,209 on Dec. 31, 1951.

Agriculture.—In 1951 the total value of agricultural production was \$360,024,000. Cash income from crops amounted to \$119,069,000, from livestock \$240,029,000 and from government payments \$926,000. The value of the 19 crops for fresh market (excluding potatoes and strawberries) totalled \$30,316,000; the value of the crops for processing amounted to \$21,409,000.

Manufacturing.—Wages paid to manufacturing workers in 1951 totalled \$3,050,091,047; for the first quarter of 1952 they amounted to \$789,447,646. In March 1952, 813,085 workers were employed in manufacturing. (R. H. M.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in New Jersey in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available.

Table III.—Mineral Production of New Jersey

Mineral	1950		1949	
	Quantity (In short tons)	Value	Quantity	Value
Clay	602,000	\$1,278,000	537,000	\$1,314,000
Coke*	1,481,000	?	1,345,000	?
Iron ore	658,000	5,652,000	502,000	4,469,000
Manganiferous residuum	184,000	†	159,000	†
Marl (greensand)	4,000	304,000	6,000	277,000
Peat	26,000	186,000	26,000	181,000

Zinc	55,000	17,259,000	51,000	14,443,000
Other minerals	3,020,000	...	2,267,000
Total		\$46,391,000		\$38,584,000

*Values for processed materials are not included in the totals.

†Value included with other minerals.

New Jersey ranks 31st among the states in value of mineral output, with 0.39% of the U.S. total.

New Mexico. A state in southwestern United States, popularly known as the "Sunshine state," New Mexico was admitted to the union in 1912. Area: 121,666 sq. mi. (121,511 sq. mi. land, 155 sq. mi. water); pop. (1950): 681,187, a 28.1% increase over 1940; rural 339,298; urban 341,889; white 630,211; nonwhite 50,976. Capital, Santa Fe (27,998). Other cities: Albuquerque (96,815); Roswell (25,738); Carlsbad (17,975); Clovis (17,318); Hobbs (13,875); Las Cruces (12,325).

History.—The first Republican governor in New Mexico in 20 years took office in 1951. Otherwise the administration, legislative and congressional representation were Democratic. The

chief officers of the state during 1952 were: governor, Edwin L. Mechem; lieutenant governor, Tibo J. Chavez; secretary of state, Beatrice Bassett Roach; auditor, Robert Donald "Boh" Castner; treasurer, R. R. Grissom; attorney general, Joe L. Martinez; superintendent of public instruction, Tom Wiley.

The 1951 legislature rescinded the Indian liquor prohibition law, created a nine-member bipartisan legislative council and a board of educational finance for institutions of higher education and modified the primary law to provide for a preprimary nominating convention.

The gasoline tax was reduced from seven cents to six cents, and the Kit Carson Memorial state park was established at Taos.

Education.—For the school year 1950-51, 3,886 teachers served in municipal schools at an average salary of \$3,401.44, and 1,387 teachers in rural schools at \$3,006.18. The total pupil enrolment was 155,661 and total expenditures were \$35,310,483.50.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the fiscal year ended June 30, 1952, a total of \$1,449,998.07 was paid for unemployment benefits; unemployed veterans received a total of \$2,389; and self-employed received \$600.

For the same fiscal year, 12,012 beneficiaries received \$3,825,000 from old-age and survivors insurance.

The penitentiary appropriation was \$400,000 for 635 inmates (Sept. 1); insane asylum \$1,200,000, 1,153 inmates (Sept. 1); Los Lunas mental hospital \$177,000, 120 inmates (Oct. 1); industrial school \$85,000, 130 inmates (Oct. 1); Girls' Welfare home \$190,000, 126 inmates (Oct. 1).

Communications.—New Mexico had an estimated 52,902 mi. of unsurfaced roads and 10,610 mi. of surfaced highways, both county and state, in 1952. The state highway department expended \$22,728,547.39. Steam railway companies operated 2,495 mi. of main track. There were 97 airports, 1,872 mi. of controlled civil airways and 4 scheduled air carriers. There were about 142,700 telephones.

Banking and Finance.—On March 31, 1952, there were 26 national banks with total deposits of \$284,208,000; loans \$86,365,000; investments \$129,026,000; and on Dec. 31, 1951, there were 25 state banks with deposits of \$112,518,884.84; loans \$35,873,885.22; investments \$44,497,061.16.

Total resources of 12 building and loan associations in 1951 were \$15,383,884.60 and of 7 federal savings and loan associations \$24,901,814.26.

The total of all state receipts for the fiscal year ended June 30, 1952, was \$112,342,911.40; total disbursements \$106,450,064.50; and total bonded debt \$19,463,000.

Agriculture.—The total estimated value of agricultural production in 1951 was \$109,229,000; acreage harvested 1,398,000. Livestock was estimated at \$246,124,000 (Jan. 1, 1952).

Table I.—Principal Crops of New Mexico

Crop	Indicated 1952	1951	Average 1941-50
All hay, tons	454,000	418,000	435,000

available. New Mexico ranks 1st among the states in the production of potash, 2nd in manganese ore and 3rd in copper, and stands 14th in the value of mineral output, with 1.77% of the U.S. total.

Newspapers and Magazines. U.S. Newspapers.— Coverage of an exciting presidential campaign, with the Korean war in the background, monopolized the news in United States newspapers during 1952. But in the business offices, rising publishing costs and the boom of the new teletypesetter also received much attention. Hundreds of newsmen reporting the two presidential conventions in Chicago in July faced the new competition of television, which joined with radio in carrying the convention story to the public. Campaign surveys showed newspaper editorial pages preponderantly supporting the Republican candidate. One poll of about half the dailies reported 75%, representing 81% of the circulation, favouring Republican Dwight D. Eisenhower, 15% supporting Democrat Adlai E. Stevenson, with about 10% neutral. In comparison, the largest Republican support in any previous election was 66% in 1940 opposing Pres. Franklin D. Roosevelt's third term. The 1952 record was credited to the switch of neutral or Democratic southern dailies. Another poll of about 3,000 weekly newspapers in 47 states reported 66% Republican.

Teletypesetter and wire delivery of news on tape to operate typesetting machines, which started in 1951, continued to be the leading innovation. The year end was expected to see teletypesetter circuits in all states and half the daily newspapers using the service. Already the International Typographical union had become concerned over the labour-saving aspects and had signed its first compromise contracts in Rockford, Ill., on May 8—after a seven-week strike—and in Harrisburg, Pa., on July 1. These agreements limited use of tape to spot news and banned feature copy. The C.I.O. American Newspaper guild in July voted to study the effect of the teletypesetter on reporters. On Aug. 5 Associated Press started radio-teletype news service linking all of South America. The effect of television on newspaper circulation led to concern, but surveys showed no serious result so far.

A \$10 increase in June took the price of newsprint to an average of \$126 a ton—the second rise in a year, which meant a 26% increase in 19 months and a rise of \$50,000,000 a year in newspaper costs. On the west coast 43 newspaper publishers joined forces to build a \$5,000,000 paper mill at Tacoma, Wash., but a 12-year effort to make newsprint of Louisiana "bagasse" was declared unsuccessful.

For the sixth year, newspaper costs increased faster than income. The profit margin of the average daily was down 17% from that of 1951, and narrower than in any year since 1945. Circulation totals, which reached the record-breaking figure of 14,000,000 in 1951, seemed to be levelling off; large city morning and Sunday newspapers declined almost 1% although the evening papers of smaller cities held or increased. Street sale and subscription prices were increased everywhere; New York tabloids went to 4 cents and the Sunday *Times* to 20 cents. Advertising volume tended to be slightly above 1951 except as it dipped during the summer steel strike; although local advertising held up better than general advertising, it was expected that the high total of \$513,000,000 in national advertising in 1951 would be approached. Advertising rates were increased; members of the Inland Daily Press reported their rates 32% above those of 1945. The number of weekly newspapers was reported to be down to 8,892 with an average circulation of 1,943 per newspaper and a total circulation of 17,269,183. Because the number of weeklies using "ready prints" or "patent insides" was down to 1,412, Western Newspaper union on March 29 discontinued its printed service which dated from 1865 and once supplied 7,000 weeklies with 1,250,000 weekly copies printed in 27 plants. Among other rising costs of the year was an increase of from 6% to 20% on Western Union press rates.

NEWSPAPER SUPPORT of Democratic and Republican candidates in U.S. presidential elections (Source: Editor & Publisher)

The longest strike of the year was on the *Tacoma News Tribune* (Wash.) when A.F. of L. pressmen and C.I.O. guildmen tied up the newspaper for 17 weeks, ending Aug. 12. The International Typographical union convening in October voted a 2½% assessment on its 85,000 members to raise a \$10,000,000 special defense fund, part of which was to continue the 11 Unitypno newspapers that the union was publishing in various cities at a combined loss of \$3,500,000. Giving a 284-to-53 vote of confidence to its president, Woodruff Randolph, the union voted to continue fighting the closed-shop ban of the Taft-Hartley law, following the Dec. 27, 1951, order of the U.S. seventh circuit court enjoining the union to obey the law. The American Newspaper guild convening in July voted a new by-law giving the national office more authority over local guilds. In February John L. Lewis' United Mine workers "catch-all" district 50, attempting to organize newspaper printers, closed the *Hazard Herald* (Ky.).

The most notable newspaper lawsuit in 1952 was the prosecution of the *New Orleans Times-Picayune* and *States* by the federal department of justice for violation of the Sherman Anti-trust act with their "unit advertising rate"; on May 17, a Louisiana federal court found the newspapers guilty of unfair competition with the *New Orleans Item*, but the decision was to be appealed. This decision followed anti-trust prosecution of the *Mansfield News-Journal* (O.) on Jan. 15 and of the *Lorain Journal* (O.) on Dec. 11, 1951. The department of justice also began investigating the advertising practices of the *Kansas City Star* and *Times* (Mo.), and newspaper publishers were concerned because these decisions would become a pattern for 170 morning-evening newspaper combinations elsewhere. Another notable case was the trial in Lake Charles, La., of five newspapermen on the charge of defaming 16 public officials and 3 gamblers in an antigambling crusade; the newsmen were acquitted in April after a long trial. In two decisions newspapers were upheld in discharging employees for being members of the Communist party. Discussion of the right of newspapers to examine public records resulted in flare-ups in various states; one brought a contempt action against the *Atlanta Constitution* (Ga.) in April. The *China Daily News*, foreign language newspaper of Chicago, Ill., was indicted in May for violating "the trading with the enemy act."

The 111-year-old *Cincinnati Inquirer* (O.) was sold on June 7 by the estate of John R. McLean for \$8,000,000 to the employees of the newspaper. The 121-year-old *Boston Post* (Mass.), owned by the Edwin A. Grozier family for 61 years, was sold in

June to John Fox, Boston and New York financier. The Ridder brothers, owners of 12 newspapers and radio stations in New York city, St. Paul, Minn., Duluth, Minn., and other cities, bought the *San Jose Mercury and News* (Calif.) on July 24 and the *Long Beach Press-Telegram and Independent* (Calif.) on Aug. 10. The eight Speidel newspapers, capitalized at \$6,000,000 and published in six states, were set up as employee owned on June 20 by John Ben Snow. The *Johnstown Tribune and Democrat* (Pa.) were merged into an all-day newspaper on Sept. 8. Joint publishing operation was started in September by three newspapers of Salt Lake City—the *Tribune*, *Deseret News* and *Telegram*. Robert L. Smith on Sept. 1 bought the tabloid *Los Angeles Daily News* (Calif.) from Manchester Boddy; it had been founded in 1923 by Cornelius Vanderbilt.

Magazines.—A boom of men's magazines, stressing adventure and exposé, was the 1952 innovation; led by *Esquire*, numerous titles such as *Stag*, *Male*, *Cavalier*, *Adam*, *Man's Day*, *Man's Life*, *Mr. America*, *Saga*, *Fury*, grossed 9,000,000 newsstand sales. Comic books with more than 300 titles continued to be the biggest business on the newsstands; rising costs reduced their size and threatened to raise the 10-cent price. Paper became more plentiful and dropped somewhat in price, to an average of \$180 a ton. Advertising increased sharply early in the year but suffered a midyear slump; earlier, a total for the year of \$550,000,000, 11% over 1951, was forecast, as magazine advertising was rising faster than either newspaper or radio advertising. Circulation went up as much as 6% early in the year but later declined; *Life* led with 5,358,000, followed closely by *Ladies Home Journal*, *Woman's Home Companion*, *Saturday Evening Post* and *McCall's*, all far above 4,000,000 each. Many magazines raised copy prices from 25 to 35 cents. The first 10% rise in postal rates went into effect, and slow postal delivery led one magazine group to try house-to-house delivery.

(G. M. Hy.)

The National Press Photographers association embarked on the first stage of a co-ordinated nation-wide educational program for the promotion of photo-journalism in 1952. In collaboration with Encyclopædia Britannica, Inc., and selected colleges and schools of journalism throughout the country, the association conducted three short courses in the field of camera reportage. These courses, which were held at the University of Kansas, Boston university and the University of Wisconsin in 1952, were designed to supplement educational ventures for photo-journalism already established at certain institutions of higher learning throughout the United States.

The pattern for this national program, conducted by and for press photographers, had been set by independent short courses already established at Kent State university, Kent, O.; the Southern Short course, University of North Carolina, Chapel Hill; the N.P.P.A. Region 1 seminar at Boston university (Mass.); the University of Missouri Photo workshop, Jefferson City; the Michigan Press Photography conference, Michigan State college, East Lansing; and the Press Photographers' Short Course, the University of Illinois, Urbana. (X.)

Canada.—During 1952 the Canadian Press completed its teletypesetter service to 25 Ontario dailies. Plans were under way for conversion next in Manitoba and Saskatchewan, then Alberta and British Columbia, and finally the Atlantic provinces.

The Roy Thomson chain of dailies expanded to 15 with the purchase of the *Vancouver News-Herald* (B.C.) from the *Vancouver Sun*. In October J. K. Cooke, owner and publisher of *New Liberty* magazine, purchased *Saturday Night* and *Canadian Home Journal*, to make him a leading national magazine publisher in Canada. An advertisement in October announced that all the shares of the daily newspaper *Toronto Telegram* (Ont.) were for sale and that tenders would be received up to Nov. 18.

Le Devoir of Montreal, Que., was the first Canadian daily to increase its price to 10 cents per copy.

During the year, the *Windsor Star* (Ont.) was fined \$1,000 for contempt of court upon the publication of an article which "made laughing stock of court procedure." The *Vancouver Sun* (B.C.) won an appeal against a judgment for \$1,025 which had been awarded when a reader suffered a nervous breakdown after reading a news item (which turned out to be false) that members of her family had been killed in a car-train crash; the British Columbia court of appeal ruled that an inaccurate news report was not actionable unless it was published with malice.

On March 23, 1952, the *Royal Gazette*, Halifax (N.S.), the oldest continuous newspaper publication in North America, celebrated its 200th anniversary. (C. Cy.)

Great Britain.—The year 1952 saw the virtual end in Britain of the newsprint famine, but some newspapers were prevented by the high price of paper from taking full advantage of the permitted increase in their size. Figures indicated, however, that the downward trend of circulations resulting from the 1951 rise in prices had been arrested.

The equalized price of newsprint was increased on Jan. 1, 1952, by £1 to £66 a ton, which proved to be the highest peak reached. In February the ministry of materials decided to fix a ceiling price for pulp imported from Scandinavia. The equalized price was reduced in March to £63 2s. 6d. and again in June to £55 15s.

The general easing in the newsprint supply position turned the sellers' market into a buyers' market almost overnight. From Aug. 24 freedom of consumption was restored. Because of the continued high price of newsprint, the newspapers were slow to take advantage of these improvements in supply. Several national dailies made larger spaces available to advertisers.

At the beginning of 1952 restrictions on deliveries of mechanical printing paper deprived publishers of periodicals of from 15% to 20% of their paper supplies. The restrictions were withdrawn in June and the only limiting factor to supplies of paper was the amount of wood pulp imported, this being governed by the amount of currency made available by the treasury and the price of the wood pulp in Scandinavia. The periodical press was hampered also by advances in the price of paper, rises in wages and salaries and printing charges. In spite of this the trend of sales of periodicals and magazines showed that a number were getting back sales lost in 1951 because of selling price increases.

Commonwealth and Europe.—From South Africa was reported the disappearance of the "last two liberal and progressive journals in South Africa," the weekly *Forum* and the monthly *Common Sense*, both more than ten years old. The Capetown weekly newspaper, the *Guardian*, was banned under the new Suppression of Communism act. *Die Volksblad*, a Bloemfontein newspaper, was fined for contempt of the appellate division of the South African supreme court.

A report of the United Nations Educational, Scientific and Cultural organization showed that France published 164 daily newspapers, Britain 121, Switzerland 117 and Belgium 76; the highest proportion of readers was in Britain where 600 newspapers were sold daily to every 1,000 people.

The International Press institute, an organization of editors of the free world, held its first general assembly in Paris. The institute noted a "growing tendency towards government restriction of legitimate news sources, even in democratic countries with a strong tradition of a free press." An International Federation of Journalists was launched at a conference in Brussels. Its constitution restricted membership to those national organizations of trade unions "dedicated to the freedom of the press."

The Allied council in Austria protested against the action

of the Soviet element who had unilaterally banned more than 100 newspapers in the towns and villages and confiscated thousands of copies of newspapers and magazines. Under a press decree passed in 1945 the Allied council was the only agency competent to confiscate, or prohibit the publication, circulation or distribution of newspapers and periodicals in Austria.

Because of declining circulation of French Communist daily newspapers, an appeal was made for 200,000,000 fr. "for the defense of the Communist and democratic Press." The pro-Communist weekly *Action*, founded as an underground periodical in 1943, ceased publication because of financial difficulties. André Stil, editor of the Communist newspaper *L'Humanité*, was arrested and imprisoned for nearly two months under a law of 1848 on demonstrations. His newspaper had published an article calling on people to protest against the arrival of Gen. Matthew Ridgway, the new supreme commander, Allied forces, Europe.

Draft proposals for new press laws to safeguard the freedom of the press and ensure the accuracy of news reported were published in the German Federal Republic. The *Overseas Weekly* of Frankfurt, published for Americans in Europe, cut its selling price by half. Publication of the *Berliner Morgenpost*, suppressed by Hitler, was resumed after an interval of nearly 20 years; it absorbed the *Berliner Anzeiger*.

A bill introduced into the Italian parliament set forth the government proposals for the control of the press, which empowered the police to sequester offending periodicals in certain cases; established that copies of all publications should be deposited with the authorities before sale; and provided for penalties for those who prevented by threats or violence the

publication and sale of approved periodicals. The Rome correspondent of the Moscow *Pravda* was expelled from Italy and the head of the Polish news agency in Rome was also requested to leave.

A faculty of journalism was set up at Moscow university. The publication of the Russian-language magazine *Amerika*, produced by U.S. authorities for distribution in the U.S.S.R., was suspended because of progressive restrictions on distribution and on the free sale of the periodical. At the same time the U.S.S.R. was asked to suspend Soviet embassy publications issued in the United States. (See also ADVERTISING.)

(D. Hn.)

New York. New York, one of the original 13 states, has been known since 1784 as the "Empire state." Northernmost of the middle Atlantic states, it covers an area of 49,576 sq.mi., of which 1,632 sq.mi. are water. It is the

most populous of the states of the United States, the 1950 census giving it a total of 14,830,192 persons, or 9.8% more than in 1940. The principal cities and their 1950 populations are: New York 7,891,957; Buffalo 580,132; Rochester 332,488; Syracuse 220,583; Yonkers 152,798; Albany (state capital) 134,995; Utica 101,531; Schenectady 91,785; Niagara Falls 90,872; Binghamton 80,674.

History.—The 1952 session of the legislature passed a total of 1,209 bills, of which 374 were vetoed by Gov. Thomas E. Dewey and 835 became law. Most controversial was the Metcalf-Hatch bill permitting use of homeless cats and dogs for research in behalf of medical science. Under the new law, those animals may be requisitioned by health officers, after confinement in a public pound, and turned over to authorized laboratories for medical experimentation.

Despite vigorous opposition by a farm bloc, a bill legalizing sale of yellow oleomargarine was passed in both houses. Effective July 1, 1952, the law permits manufacture and sale of yellow oleomargarine when packaged or stamped as such.

In an effort to increase New York city's water supply, a law was enacted authorizing the state to join with New Jersey, Pennsylvania and Delaware in developing the Delaware river basin. The bill provided for a joint commission to study and proceed with the \$550,000,000 project, if all states concur and the project receives congressional approval.

The legislature continued the state civil defense commission and reappropriated \$25,000,000 in state aid for public bomb shelters. Another bill authorized any city or county, with the approval of the commission, to issue up to \$30,000 in bonds a year to meet civil defense expenses.

Automobile liability insurance requirements were expanded to include all drivers under 21 years of age. Operation of an uninsured car by a minor was banned. Narcotics laws were tightened by several measures. The new State Thruway authority was granted the right to license and control billboard and other advertising within 500 ft. of the new highway. Ground was broken in Sept. 1952 for the third tube of the Lincoln tunnel, to be built by the Port of New York authority as another vehicular link between New York and New Jersey. Cost of the additional tube was estimated at \$90,000,000.

An increase from \$26 to \$30 a week maximum benefits was granted under the Sickness Disability Insurance law.

The state's \$69,800,000 veterans' emergency housing program, which provided temporary accommodations for more than 70,000 persons during a period of seven years, as well as quarters for about 100,000 veteran students, was being gradually terminated. The time for liquidation of the veterans' emergency housing projects was extended one year.

As of March 31, 1952, \$577,355,400 of the over-all \$735,000,000 capital loan fund authorized by the state for public housing for low-income families had been earmarked for 67 low-rent state-aided public housing projects. A total of \$145,755,640 was paid to 251,279 living veterans in New York state in compensation and pensions in the year ending June 30, 1951, while dependents of 60,728 deceased veterans of New York state received \$43,167,598 in such benefits during this period.

The New York State Veterans' camp at Mt. McGregor, 9 mi. N. of Saratoga Springs, provided care in 1951 for 2,947 veterans recuperating from acute illnesses. Since its opening in 1945, through 1951, the camp had aided 14,613 patients.

Thomas E. Dewey (Rep.) was re-elected for a third four-year term Nov. 7, 1950. Other state officials elected then were: lieutenant governor, Frank C. Moore; comptroller, J. Raymond McGovern; and attorney general, Nathaniel L. Goldstein.

Education.—At the close of the school year ending June 1951 there were 5,124 elementary public schools with 1,371,182 school children; there were 142,266 pupils in 163 junior high schools and 477,341 students in 821 public high schools. There were also 1,173 private and parochial schools with 417,211 pupils in the elementary grades and 81,941 pupils in 296 secondary schools. The enrolment at universities, colleges and other institutions of higher learning in the state in 1951 was 271,976, excluding 170,433 summer and extension students.

Special state schools included 6 Indian schools, 6 agricultural and technical institutes, 5 institutes of applied arts and sciences, 133 schools for nursing, 3 institutes for the blind and 6 for the deaf.

Social Insurance and Assistance, Public Welfare and Related Programs.—A total of 1,280,000 persons were given assistance, care or service at public expense during 1951, a decrease of 23,000 from the preceding year. During 1951, expenditures for public welfare totalled \$419,744,000. Of this sum, the federal government's share was \$90,164,000; the state's share, \$146,498,000; and the local governments' share, \$183,082,000. An additional 2,480,000 persons were given assistance or care in New York state as private charges. During 1951, the state certified 7,988,580 unemployment insurance claims (8,530,490 weekly units) totalling \$189,473,492. On Dec. 31, 1951, the New York State Unemployment Insurance Trust fund had a balance on hand of \$1,060,515,637.

The state department of correction administers 17 institutions. In 1951 the average yearly population of the state's correctional institutions was 17,347. The average cost for the care and maintenance of institutional inmates during the fiscal year was \$1,552.95 per person.

For the care and treatment of the mentally ill, mental defectives and epileptics, the state in 1951 maintained 20 hospitals including a psychiatric institute and hospital for research and teaching, a psychopathic hospital for observation and temporary treatment of mental patients, six schools for mental defectives and a colony for epileptics.

Communications.—New York state had 88,068 mi. of road on Jan. 1, 1952, of which 14,287 were state highways (exclusive of the thruway, parkways, city and village streets) and 72,661 were county and town roads. Hard-surfaced roads totalled 67,025 mi. Forty-six railroads operated 7,529 mi. of roadbed in the state.

The state maintains a system of more than 500 mi. of canals. Including the rivers and lakes which are part of the New York State Barge Canal system, the total length is more than 800 mi. During 1951 the three major commercial airports of the New York metropolitan area (Idlewild, La Guardia and Newark) handled a combined volume of 5,587,495 passengers. There were 44 seaplane bases and 254 airports operating in the state in 1951. There were 4,308 civil aircraft and 28,382 licensed pilots registered during the year.

Banking and Finance.—At the end of 1951 there were 752 banks with total resources of \$52,238,535,000 and deposits of \$46,465,923,000 operating in the state. In addition, there were 235 savings and loan associa-

tions with \$1,650,000,000 of total assets and \$1,406,000,000 due private shareholders.

For the fiscal year ending March 31, 1952, the financial status of the state was as follows: general revenue, \$996,217,779; expenditures, \$993,345,469; total operating surplus, \$2,872,310; total state debt, \$706,388,950. Capital Construction fund (formerly Postwar Reconstruction fund) appropriations in force April 1, 1952, \$441,435,046. Of the general fund expenditures, 45% went for the operation of 19 state departments, 60 state institutions and 33 educational institutions, as well as the legislature, courts, highway maintenance and construction. The remaining 55% were for state aid to local governmental units. These expenditures totalled \$550,213,988, an increase of \$20,005,527 over the previous fiscal year. The principal change accounting for this increase was a \$28,864,761 gain in state aid to education.

Agriculture.—Cash receipts from agricultural products in 1951 totalled \$957,378,000, compared with \$810,864,000 in 1950. In addition, government payments to farmers were \$7,135,000 compared with \$5,737,000 in the previous year.

The sale of milk and other dairy products in 1951 amounted to \$389,876,000. The total harvested acreage of principal crops, excluding orchards and vineyards, was 5,724,000. The value of livestock and poultry on farms as of Jan. 1, 1952, was \$588,576,000. This included 2,222,000 head of cattle, 16,008,000 chickens, 110,000 horses, 2,000 mules, 217,000 hogs, 155,000 sheep and 925,000 turkeys.

Manufacturing and Industry.—New York state's manufacturing industries outrank those of every other state in number of establishments, volume of employment, size of manufacturing pay rolls and value added by manufacture. In 1950 the state's manufacturing firms added \$10,506,454,000 in value to the raw and semifinished material they purchased for processing, compared with \$3,313,649,000 in 1939, according to the U.S. bureau of the census.

In terms of value, New York state produces approximately 67% of the country's total output of women's dresses, coats and blouses; 94% of women's furs; and 41% of men's and boys' tailored clothes. The state leads all others in printing and publishing and the rug and carpet industry, and produces 66% of the value of photographic equipment manufactured in the nation.

In 1951 there were 544,800 business firms in New York state. There were 5,823,000 persons employed, exclusive of agricultural workers, proprietors, domestics and personnel of the armed forces. Average weekly factory earnings in 1951 were \$64.90.

(F. P. KL.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in New York in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet available. New York ranks first among the states in the production of talc and ilmenite, second in gypsum and salt and third in sand and gravel, and stands 19th in value of mineral output, with 1.32% of the U.S. total.

Table III.—Mineral Production of New York

Mineral	(In short tons, except as noted)		1949	
	Quantity	Value	Quantity	Value
Cement (bbl.)	13,271,000	\$30,895,000	12,680,000	\$28,484,000
Clays	1,154,000	939,000	977,000	769,000
Coke*	5,412,000	73,460,000	5,165,000	69,074,000
Gypsum	1,280,000	3,876,000	916,000	2,805,000
Iron ore	3,267,000	27,915,000	2,625,000	22,185,000
Iron, pig*	4,222,000	180,158,000	3,244,000	142,108,000
Lead	1,484	401,000	1,317	416,000
Natural gas (thousand cu. ft.)	3,336,000	837,000	3,693,000	907,000
Petroleum (bbl.)	4,143,000	15,660,000	4,425,000	15,750,000
Salt	2,807,000	14,405,000	2,952,000	12,710,000
Sand and gravel	21,778,000	18,075,000	18,543,000	15,117,000
Slate	151,000	2,055,000	122,000	1,617,000
Stone	13,122,000	19,729,000	13,022,000	18,160,000
Talc	164,000	4,040,000	116,000	2,659,000
Zinc	38,000	10,883,000	38,000	9,417,000
Other minerals	6,819,000	...	7,497,000
Total		\$156,529,000		\$138,493,000

*Values for processed materials are not included in the totals.

New York City. The permanent inhabitation of New York's five boroughs passed the 8,000,000 mark during 1952, according to the city planning commission.

Statistics furnished by such sources as the city department of commerce, the city bureau of labour relations, the Commerce & Industry Assoc. of New York, Inc., and the chamber of commerce of the state of New York, reported continued business expansion in the city during 1952, with an increase in manufacturing plants to approximately 42,250, having an annual production volume in excess of \$15,500,000,000. The assignment of \$1,500,000,000 in federal defense contracts to New York city firms during the first ten months of the year aided the industrial advancement. Additional statistics disclosed that 237,500 business establishments of all types were in operation, employing 3,850,000 persons and carrying an annual pay-roll load of \$14,000,000,000. The wearing apparel industry continued as the city's largest.

It was reported during 1952 that 41 of the country's largest corporations maintained headquarters in the metropolis; that nearly 50% of the nation's bank clearings were made in New York city; that nearly 20% of the country's income tax collections were paid by New York city corporations and individuals; and that retail sales were estimated to exceed \$15,000,000,000 over the 12-month period, representing nearly one-fifth of the country's total retail spending.

New York city suffered a slight recession in overseas shipping during 1952, losing a percentage of its export tonnage to competing Atlantic coast ports. However, nearly \$10,000,000,000 in export-import transactions was handled by local trade firms.

On July 1, 1952, the beginning of the municipal fiscal year, the city's taxable real estate was given an assessed valuation of \$19,425,499,087, the highest markup for tax purposes since 1932. Actual or market value of the community's 833,646 real estate parcels, including structures and exempt properties, was estimated to be in the neighbourhood of \$30,000,000,000.

Outstanding civic developments during the year included the integration of the 15½-mi. Rockaway division in the city's rapid transit system; beginning of work for the construction of a new convention hall and auditorium at Columbus Circle, Manhattan; and the rejuvenation of the 67-year-old Brooklyn bridge to permit greater traffic loads. (See also MUNICIPAL GOVERNMENT.) (F. L. Do.)

New Zealand. A self-governing member of the Commonwealth of Nations, New Zealand consists of two large and several small islands in the South Pacific. Area: dominion proper, 103,416 sq.mi.; other islands, 523 sq.mi. Pop., dominion proper (April 17, 1951, census): 1,939,472, including 115,676 Maoris. Cook and other Pacific islands (pop., 1951 census): 21,320. Western Samoa, a trusteeship, has an area of 1,133 sq.mi.; pop. (1951 census) 82,493. Language: English. Religion: mainly Christian (Anglican 37.5%, Presbyterian 23.4%, Roman Catholic 13.5%). Chief cities (1951 census, urban area only): Wellington (cap., 133,414); Auckland (329,123); Christchurch (174,221); Dunedin (95,457); Hutt (74,900); Palmerston North (32,908). Governors-general in 1952, Lieut. Gen. Lord Freyberg and (from Dec. 2) Lieut. Gen. Sir Willoughby Norrie; prime minister, Sidney George Holland.

History.—The centenary of constitutional government in New Zealand was celebrated on June 30, 1952, the anniversary of the New Zealand Constitution act. The governor-general, Lord Freyberg, relinquished his office in August after a distinguished term of service. Lieut. Gen. Sir Willoughby Norrie, governor of South Australia, was appointed to succeed him.

An economic survey issued by the government in Aug. 1952 maintained that the New Zealand economy was in first-class

DR. GRAYSON KIRK (right), acting president of Columbia university, New York city, conferring an honorary doctor of laws degree on Queen Juliana of the Netherlands during her visit to the U.S. in April 1952

order, with record production, no unemployment, greater variety and quantity of goods available, more industrial harmony and a balanced budget. On a population basis the country had the largest overseas trade in the world—£178 a head.

Early in the year Sidney Holland, the prime minister, attended a conference of commonwealth finance ministers in London. In March decisions taken in New Zealand following that conference resulted in the suspension of all trading licences for dollar countries, licences being introduced for the importing of motor vehicles and general measures being taken to increase production. New exchange regulations to safeguard overseas reserves followed the fall in price of wool, hides and skins. Production remained at a high level. For the season ended July 31, 1952, more than 240,000 tons of butter and cheese were exported to Great Britain (40% of all the butter consumed there) and 340,000 tons of meat (more than 40% of the meat imported by Great Britain). Although wool prices had fallen considerably compared with the previous year, the annual clip was worth more than £70,000,000. Aerial top dressing of hill pastures continued to be expanded and 93,000 tons of fertilizer were dropped from the air on more than 1,000,000 ac. A trial shipment of quick-freeze beef to Great Britain was highly successful and gave encouragement to beef producers.

External trade in the previous trading year (1951) showed a healthy increase: The value of exports was £248,131,000 compared with £183,753,000 in 1950. Imports in 1951 were £206,463,000 (£157,896,000 in 1950). The reserves in the dairy and meat stabilization accounts slightly increased to £25,500,000 for dairy produce and to £38,750,000 for meat while the gross national produce figure rose in 1950-51 to £681,000,000. A provisional figure for 1951-52 showed an increase to £709,000,000. Average wage per head in those industries coming under the jurisdiction of the Arbitration court rose from £9 15s. in April 1951 to £10 7s. 10d. in April 1952.

The Murupara project for the development of the paper pulp industry was further advanced as a joint state and commercial

project. A board of directors was set up, consisting of three government nominees and three from private industry. Further steps were taken in another important project, the Auckland harbour bridge, involving an expenditure of slightly more than £4,000,000. A railway commission set up earlier recommended that the nationally owned railways should be run by a corporation in the same way as the air lines.

An important land measure was a notable feature of parliamentary legislation. The Land Settlement bill reimposed the principle of compulsory acquisition of land for closer settlement, required a purchaser of developed land to reside on the farm for at least three years, and prevented undue aggregation. New Zealand reached 2,000,000 in population during 1952. Assisted migration continued from Great Britain and the Netherlands. A reduction in the quota of assisted immigrants was announced although the basis of selection remained the same; *i.e.*, with the emphasis upon skilled tradesmen and other operatives. In 1953 only 5,000 British and 1,500 Dutch migrants were to arrive. New Zealand showed its interest in the Colombo plan by direct grants for Asian projects and by providing experts.

In international affairs, New Zealand continued to support the principles of the United Nations in Korea. Replacements by drafts were made to the New Zealand contingent of the Commonwealth division. An air force squadron was sent to the middle east. The defense of the country was gradually strengthened, particularly by the implementation of the ANZUS (Australia, New Zealand and United States) pact. A meeting of the representatives of the three powers concerned was held at Honolulu, T.H., in August.

In the field of sports a New Zealand All Black Rugby team drew with Australia, each country winning one test; and in the Olympic games, by the success of Yvette Williams in the women's long jump, New Zealand won its first gold medal since J. E. Lovelock's win in the 1,500-m. run at the Berlin games in 1936; two bronze medals were also won.

(A. T. CL.)

Education.—Schools (Dec. 1950): primary 1,908, pupils 254,081, teachers 6,948; Maori village schools 159, pupils 13,426, teachers 540; Maori missions schools 10, pupils 826; secondary 47, pupils 22,824, teachers 1,102; private secondary 83, pupils 10,154, teachers 545; Maori secondary 11, pupils 817, teachers 28; district high schools 110, pupils 6,992; technical 29, pupils 13,859, teachers 786; teachers' training colleges 5, students 2,302; agricultural colleges 2, students 579. University of New Zealand (four colleges) students 10,936.

Finance and Banking.—Budget (consolidated fund and social security fund, excluding war expenses account): (1951–52 actual) revenue £N.Z.180,700,000, expenditures £N.Z.168,100,000; (1952–53 est.) revenue £N.Z.170,000,000, expenditure £N.Z.167,300,000. Gross national debt (March 1952): £N.Z.679,900,000. Currency circulation (Sept. 1952): £N.Z.59,331,000. Bank deposits (May 1952): £N.Z.194,000,000. Gold and foreign exchange (July 1952): U.S. \$255,000,000. Monetary unit: New Zealand pound, with an exchange rate of £N.Z.1.00375 to the pound sterling and £N.Z.0.362 to the U.S. dollar.

Foreign Trade.—(1951) Imports £N.Z.206,500,000, exports £N.Z.248,100,000. Main sources of imports (1951): U.K. 54%; Australia 10%; U.S. 9%; Canada 3%. Main destinations of exports (1951): U.K. 58%; U.S. 12%; France 7%. Main imports (1951): machinery, metals and manufactures 54%; textiles and clothing 48%; vehicles 20%. Main exports (1951): wool 52%; dairy produce 26%; meat 13%.

Transport and Communications.—Roads (1949): 76,859 mi., of which arterial roads were 12,470 mi. Licensed motor vehicles (Dec. 1951): cars 272,733, commercial 95,154. Railways (March 1951): 3,531 mi.; traffic (March 1952): passenger journeys, including railways motor services 45,957,000; freight carried 9,829,000 tons; freight, ton-miles 1,069,200,000. Shipping: merchant vessels, 100 gross tons and more (July 1951) 164; total tonnage 232,427. Air transport, domestic (March 1950): passenger-miles 59,745,000; cargo, net ton-miles 1,833,300. Telephones (1951): subscribers 271,935. Radio receiving licences (March 1951): 465,609.

Agriculture.—Main crops (metric tons, 1951): wheat 110,000; barley 43,000; oats 38,000; maize (1950) 6,000; potatoes 86,000; linseed (1950) 8,000; tobacco (1950) 2,500. Livestock (1951): cattle 5,060,000, of which dairy cows 1,898,000; sheep 34,786,000; pigs 564,000; horses 183,000. Livestock products (metric tons, 1951): meat 530,000, of which beef and veal 177,200, pork 11,400, mutton and lamb 292,400; wool, clean basis (1951) 119,000; factory butter (1951) 184,800, factory cheese 116,300. Fisheries: total catch (1950) 32,385 metric tons.

Industry.—Industrial establishments (April 1951): 37,420; persons employed 491,204. Fuel and power (1951): coal 688,000 metric tons; lignite 1,778,000 metric tons; manufactured gas 138,000,000 cu.m.; electricity, c. 87% of total generation 2,892,000,000 kw.hr. Industrial products (metric tons, 1951): cement 202,800; superphosphates 131,960.

Nicaragua. A Central American republic, Nicaragua is situated between Honduras on the north and Costa Rica on the south. Area: 57,145 sq.mi., of which 3,475 sq.mi. are water. Pop. (1950 census of the Americas) 1,053,189, of whom 688,373 were rural residents; (1951 est.) 1,088,000. Capital: Managua (1948 pop. est.: 146,819). Other urban centres are Chinandega (26,112), Granada (39,643), Jinotega (41,065), León (53,277), Masaya (38,761) and Matagalpa (53,118). Language: Spanish; religion: predominantly Roman Catholic. President in 1952: Gen. Anastasio Somoza.

History.—Politically, 1952 appeared to be a relatively uneventful year for Nicaraguans. Administrative reforms following the adoption of the constitution of 1950 continued to occupy the attention of government officials. As President Somoza's position moved toward further consolidation, his political opposition became less articulate. Diplomatic relations with the other Central American states—including Guatemala, with which Nicaraguan relations had been strained since 1948—appeared to improve during the year. (G. I. B.)

Education.—During the school year 1951–52 there were 1,035 national primary schools with 65,305 pupils matriculated and 2,129 teachers, 91 private schools with 10,663 pupils and 431 teachers, 63 municipal schools with 2,738 pupils and 77 teachers, 13 national institutes with 1,575 students, 3 normal schools with 462 students, 32 commercial schools with 3,944 students and 24 private secondary schools with 2,077 students. The National university (León) had 620 students in 7 faculties, including one at Managua. In the fiscal year 1950–51 education received 10.7% of net government expenditures. In 1951 there were 50 motion-picture theatres with seating capacity of 48,000.

Finance.—The monetary unit is the córdoba, valued on Sept. 30, 1952, at \$0.2000 U.S. currency, official rate; \$0.1429, basic rate; and \$0.1370, curb rate. The national budget for the fiscal year 1952–53 provided for expenditure of 132,935,546 córdobas. In 1950–51 expenditure totalled 116,103,000 córdobas and revenue, 121,719,000 córdobas. The public debt in June 1952 was 45,681,000 córdobas, of which 13,241,000 córdobas was external. Currency in circulation (Sept. 30, 1952) was 78,400,000 córdobas; demand deposits 81,400,000 córdobas; gold reserves \$2,760,000; foreign exchange reserves \$14,290,000. The retail food price index (Managua) stood at 140 in May 1952 (1948=100).

Trade and Communications.—Exports in 1951 amounted to \$36,750,000 (excluding gold exports valued at \$8,770,000); imports were \$29,960,000. Leading exports besides gold were coffee (51%), cotton (15%), sesame (7%) and cattle (3%). Leading customers were the U.S. (60%), the United Kingdom (19%) and Japan (6%); leading suppliers, the U.S. (72%), Germany (5%) and the Netherlands Antilles (5%). Important imports were textiles, iron and steel and manufactures, cotton manufactures and machinery.

In 1951 there were 268 mi. of railway and (1949) 417 mi. of surfaced highways. As of Jan. 1, 1949, registered motor vehicles included 1,443 automobiles, 672 trucks and 151 buses.

Agriculture.—Production of coffee, the chief crop, in the 1951–52 season totalled 357,000 bags of 132 lb. each, of which 295,020 bags were exported, 273,370 bags to the U.S. In 1950, 7,466 metric tons of sesame, 3,307 tons of cotton and 661,645 banana stems were exported. In 1951 there were 1,103,000 cattle.

Mineral Production.—Mineral exports in 1951 included 250,534 troy ounces of gold and 209,898 oz. of silver. (J. W. Mw.)

Nickel. Table I shows the output of nickel in the major producing countries, as reported by the U.S. bureau of mines.

Table I.—World Production of Nickel

	(In short tons)				
	1947	1948	1949	1950	1951
Canada	118,627	131,740	128,690	123,659	137,268
Cuba	2,220	—	—	—	—
Finland	?	—	—	—	—
Japan	—	—	—	—	—
New Caledonia	3,687	5,381	3,716	6,945	10,000 ^a

Table II.—Nickel Supply in the United States

	(In short tons)				
	1947	1948	1949	1950	1951
Production	646	883	790	913	756
Secondary recovery	9,541	8,850	5,680	8,795	—
Imports*	88,408	106,939	97,144	97,959	102,325
Nickel content	80,718	91,400	91,471	91,553	93,116
Exports*	12,037	8,184	4,470	3,645	4,622
Consumption	80,757	93,558	68,326	98,904	86,416

*Includes gross weight (not nickel content) of ore, matte, oxide and alloys.

United States.—The salient statistics of nickel in domestic industry are shown in Table II.

Cuba.—The Nicaro nickel plant, built during World War II, had been reconditioned after several years of idleness and was in operation at full capacity in 1952, with an output of nickel oxide reported to be greater than during the war years.

Canada.—Nickel production was 70,826 tons in the first half of 1952, compared with 67,391 tons in the same period of 1951. (G. A. Ro.)

Nigeria: see BRITISH WEST AFRICA.

Nixon, Richard Milhous (1913–), U.S. vice-president, was born on Jan. 9 at Yorba Linda, Calif., near Los Angeles. He was awarded his bachelor's degree from Whittier (Calif.) college in 1934 and his law degree from Duke university, Durham, N.C., in 1937; he then practised law for five years at Whittier. After a few months in Washington, D.C., as attorney for the Office for Emergency Management (Jan.–Aug. 1942), Nixon accepted a commission in the U.S. navy as lieutenant, junior grade. He saw service in the South Pacific and by the time of his discharge in 1946 had been promoted to lieutenant commander. In Nov. 1946 he was elected to the U.S. house of representatives as a Republican from the 12th California district and was re-elected in 1948 for a second term. In the house he was appointed to the un-American activities committee and figured prominently in the investigations that led to the Alger Hiss trial. In Nov. 1950 he was elected U.S. senator from California, taking office Dec. 4, 1950, when the incumbent, Sheridan Downey, resigned a month before expiration of his term.

At the 1952 Republican convention in Chicago, Nixon was nominated vice-president on July 11 and immediately began a vigorous campaign as the running mate of Dwight D. Eisenhower. His candidacy seemed jeopardized in September when the U.S. press published reports that a fund of \$18,235 had been raised by friends in California to help defray Nixon's political expenses as a senator. In a national telecast on Sept. 23, however, Nixon disclosed his personal finances in detail and declared that he had not profited at all as an individual from the fund. Eisenhower promptly declared his faith in Nixon, as did the Republican national committee, and Nixon remained on the ticket. Their decisive victory on Nov. 4 showed that the incident had done them no harm with the electorate.

NLRB: see NATIONAL LABOR RELATIONS BOARD.

Nobel Prizes. The Nobel prizes for literature, physics, chemistry, medicine and peace, first awarded in 1901, were established by the Swedish industrialist, Alfred Bernhard Nobel (1833–1896). Each award consists of a gold medal and a sum of money which varies with the income from the \$9,000,000 fund set up by Nobel's will. In 1952 the sum was reported to be about \$33,037. On Oct. 23, 1952, it was announced from Stockholm that Selman A. Waksman, director of the Institute of Microbiology at Rutgers university, New Brunswick, N.J., had been awarded the medicine prize for his work in the discovery of streptomycin (he was a co-discoverer of the drug made known in 1943) and its effects against tuberculosis. On Nov. 6 the winners in three other categories were announced. François Mauriac, of France, a novelist, poet, playwright, essayist, biographer and newspaper contributor, received the literature prize. Felix Bloch, of Stanford university, Stanford, Calif., and Edward Mills Purcell, of Harvard university, Cambridge, Mass., shared the physics prize for their development of

a new method to measure magnetic fields in atomic nuclei. They developed the prize-winning method independently. The chemistry prize was divided between Archer Martin, a biochemist at the National Institute for Medical Research in London, and Richard Synge, a biochemist at Rowett Research institute, Aberdeen, Scot., for the development of paper partition chromatography—an ingenious method of separating compounds, which is a modernization of a chemical technique said to have been known to the ancient Egyptians. No peace prize was awarded in 1952.

The formal presentation of the 1952 prizes was made by King Gustav VI Adolf of Sweden at the traditional Nobel ceremonies in Stockholm on Dec. 10. (A. J. RR.)

North Atlantic Treaty Organization. The North Atlantic Treaty organization (NATO), established by the United States, Canada and ten west European nations in Washington, D.C., in April 1949, continued to experience difficulties in 1952. One of the fundamental issues raised in 1951 that remained unsolved was how far the member states could go in devoting their financial and economic resources to the strengthening of their defenses without endangering their national economies and standards of living. It was widely felt that it was necessary to go beyond the purely military concepts, dominant at the beginning of NATO, to the broader field of a confederation of free western nations, in order to create a functioning, coherent organization. At the end of the visit of the British prime minister, Winston Churchill, to Pres. Harry S. Truman on Jan. 9, 1952, a communiqué was given out in Washington which stressed the point that "we are resolved to build an Atlantic community, not only for immediate defense, but for enduring progress." The two statesmen pledged themselves also on behalf of their nations to support the nascent "European defense community as an element in a constantly developing Atlantic community," and thus to integrate western European unity with the British Commonwealth and the United States in a united front of the democracies.

A similar point of view was strongly expressed by Premier Willem Drees of the Netherlands in New York city on Jan. 16, 1952: "The interdependence of the nations on both sides of the ocean has assumed such concrete form during the cold war that it could not be undone any more, even if this cold war were suddenly to turn into a real peace." The Dutch would participate in the European Defense Community, but Drees stressed that these efforts were "only acceptable to us provided they constitute a component and inseparable part of the North Atlantic solidarity." Six days later, Gen. Dwight D. Eisenhower in NATO's supreme headquarters in France declared that "America, in common with the other countries in this coalition, must recognize that her own self interest is served by making NATO succeed. This identical consideration applies to every other nation." To create a closer tie between NATO and the United States, President Truman in Jan. 1952 appointed William H. Draper, Jr., as ambassador and special representative in Europe. After his first six months in this office, Draper presented on Aug. 22 a report emphasizing the need for closer economic ties. At the end of January a further step in the common security arrangement was taken when Adm. Lynde D. McCormick, commander of the United States Atlantic fleet, was named supreme NATO commander of the Atlantic, with British Vice-Adm. Sir William Andrewes as deputy commander and an international command staff with headquarters in Norfolk, Va.

These moves preceded the general reorganization of NATO, decided upon at the Lisbon conference in Feb. 1952. This conference approved the admission of Turkey and Greece as full members and the creation of the European Defense Community

(E.D.C.), designed to make possible Germany's participation in the western defense effort. The various nations agreed also to provide by the end of 1952 approximately 50 combat-ready ground divisions and about 4,000 combat aeroplanes, but later developments indicated that these goals would not be met in full by the end of the year. At Lisbon it was also proposed to create a flag for NATO, featuring a shield, symbolizing defense, against the background of blue waves, symbolizing the Atlantic ocean, and a sword and an olive branch to proclaim the goal of peace through strength. This proposal was later taken up by Lord Ismay, the new secretary-general of NATO.

Two more important steps toward advanced degrees of co-operation were taken. In one, all the nations, including the United States, agreed to submit their military budgets to an annual review by the NATO in order to agree on priorities for defense expenditure; the second concerned the structure of NATO. The office of secretary-general of NATO was created, and a new permanent council was formed, with headquarters in Paris. Gen. Hastings Lionel Ismay, Lord Ismay, was appointed the first NATO secretary-general. Under him and his deputy secretary-general, H. van Vredenburg, were three major divisions headed by René Sargent of France, assistant secretary-general for economic affairs; David Luke Hopkins of the United States, assistant secretary-general for defense production; and Sergio Fenoaltea of Italy, assistant secretary-general for political affairs.

On April 28, 1952, the North Atlantic council appointed Gen. Matthew B. Ridgway to succeed Gen. Dwight D. Eisenhower as supreme Allied commander in Europe on June 1, 1952. General Ridgway was nominated by President Truman, after the North Atlantic council had unanimously agreed to request the president to name a United States officer for consideration by the council. Gen. Alfred M. Gruenther continued as chief of staff to the supreme Allied commander in Europe. On April 2 General Eisenhower celebrated the first anniversary of the day on which he had assumed operational control of the NATO forces, with a statement in which he said: "If the free nations are to remain secure, our peoples must march together, agreed on common goals, and win that cooperative unity possible only in a free society. . . . It seems almost as if the nations of the West have been, for decades, blindly enacting parts in a drama that could have been written by Lenin. . . . This pattern of events, which points so surely to ultimate disaster, can be changed if only the peoples of the West have the wisdom to make a complete break with many things of the past and show a willingness to do something new and challenging. NATO itself is a significant step to meet both the present danger of aggression and the tragic struggles and dissensions that have divided our peoples in the past."

Undoubtedly, the NATO nations had made much progress in military and economic fields in the three years since NATO started. In 1949 the European countries which later became members of NATO lacked practically everything needed for a modern army. In many of them the will to fight seemed not to exist. By 1952 all that had changed. The budgets allocated to defense had doubled. The member nations of NATO in Europe spent the following amounts in 1949-50 and in 1951-52 (in terms of U.S. dollars):

	1949-50	1951-52
Belgium-Luxembourg	\$ 167,000,000	\$ 435,000,000
Denmark	45,000,000	97,000,000
France	1,594,000,000	3,460,000,000
Greece	115,000,000	188,000,000
Italy	475,000,000	811,000,000
Netherlands	210,000,000	395,000,000
Norway	49,000,000	115,000,000
Portugal	47,000,000	58,000,000
Turkey	175,000,000	253,000,000
United Kingdom	2,105,000,000	3,660,000,000
Total	\$4,982,000,000	\$9,472,000,000

NORTH ATLANTIC COUNCIL meeting in Lisbon, Port., early in 1952. It was the council's ninth session, with Greece and Turkey represented as full members for the first time

In spite of this progress, the course of 1952 revealed continued fundamental weaknesses in the NATO structure, principally because of the growing practice of the individual nations to make unco-ordinated unilateral decisions and to deal with problems through direct negotiations between governments, bypassing the permanent NATO machinery, which was supposed to co-ordinate the individual efforts into a joint effort.

Many resolutions on economic collaboration, the liberalization of trade and the easing of manpower movements among member nations produced little or no effective action by the governments. U.S. Sen. Guy M. Gillette, speaking on April 30 in Ottawa, Ont., suggested as a remedy the creation of a North Atlantic consultative assembly in which representatives elected by the Atlantic peoples could meet to discuss and to make recommendations on problems of the North Atlantic region. "Whatever else an assembly like this might accomplish," Senator Gillette said, "it would fill a glaring gap and introduce a basic new element now lacking in the Atlantic community, a body representing its peoples and a channel for direct communication and cooperation between them." Gen. J. Lawton Collins, U.S. army chief of staff, said on Oct. 8 on his return from Europe that he favoured giving more information about atomic weapons to other NATO nations. Unless NATO planners could have at least a general sense of the role of atomic weapons, their plans for defense of western Europe would be delayed, and in a full emergency Allied ignorance on atomic weapons might endanger the over-all defense plan and the security of U.S. troops in Europe. These views were supported by Gen. Omar N. Bradley and Gen. Alfred M. Gruenther. One minor step in the field of practical political co-operation was taken on Sept. 4, when the U.S., Britain and France invited all members of NATO to comment on the U.S.S.R. note of Aug. 23 to the above-named three powers regarding the future of Germany. This unprecedented step was taken at the request of the smaller states, for NATO

as a whole was involved in all relations with the Soviet Union and would have to bear the consequences of any important decision. Therefore widest possible consultation on all vital subjects was sought and promised.

While political and economic co-operation made only very little progress, if any, in 1952, the purely military aspects of NATO fared better. Allied land forces, southeastern Europe, established its headquarters in Izmir, Turk., under U.S. Maj. Gen. Willard Wyman with a joint staff of Greek and Turkish officers. A forward echelon, situated in Salonika, Gr., was also established under the Allied air forces, southern Europe, headquarters in Florence, It. In September the biggest Allied naval exercise was held in the North sea and in the Danish and Norwegian coastal waters, under the direction of British Adm. Sir Patrick Brind, who was the NATO commander in chief in northern Europe with headquarters in Oslo. Ten nations, the U.S., Great Britain, Canada, New Zealand, Norway, Denmark, the Netherlands, Belgium, France and Portugal, participated. The fleet comprised one U.S. and one British battleship, six U.S. carriers, four British carriers and one Canadian carrier.

Another step to strengthen NATO, taken in 1952, was the conclusion of the pact establishing the European Defense Community (E.D.C.), consisting of France, Germany, Italy, Belgium, the Netherlands and Luxembourg. This defense agreement, however, had not been ratified by the end of 1952, and there seemed serious opposition to it in both Germany and France. Two outside factors contributed to the weakening of the ties and to the lessening of co-operative enthusiasm, at least for the time being, at the end of Oct. 1952. One was the election campaign in the United States, which concentrated American attention on domestic problems. The other was the declaration by U.S.S.R. Premier Joseph Stalin at the beginning of October, before the opening of the 19th Communist Party congress, that he did not expect in the near future a war between the "capitalistic" world and the U.S.S.R. He put his hope for Communist victory in the disintegration of the Atlantic union. He proclaimed that, according to Communist doctrine, a war among the "capitalistic" nations was inevitable and he expressed his conviction that Great Britain and France would soon be forced to fight in self-defense against the United States. Thus, while the Soviet government seemed to abandon, for the time being, plans of direct military aggression, it put its hope into weakening and dividing the Atlantic alliance by political and economic means. To counter this threat, Field Marshal Viscount Montgomery, deputy chief of the NATO military forces, suggested that there should be a supreme NATO commander for the "cold war." He declared that an over-all NATO plan and effective machinery were lacking. In this connection the Mutual Security Agency in Washington prepared at the end of Oct. 1952 a plan to end continued dollar grants for economic aid by creating an Atlantic reserve system for currency stabilization and an Atlantic economic board to co-ordinate trade and other policies affecting currency relationships. Under this economic board, an Atlantic commodity board would seek to stabilize production and prices of essential raw materials through long-term agreements with producer countries and thereby remove the need for restrictive cartel arrangements. Though these proposals were in only the first stage of discussion at the close of the year, they pointed toward a much closer economic integration of the NATO nations by creating an organizational arrangement for continuous review and appraisal of national policies bearing on the security of the pooled reserve. The Consultative assembly of the Council of Europe, meeting in Strasbourg, Fr., demanded on Sept. 27 that equality in sharing the economic burden of defense by the European NATO partners must be matched by equal consideration in the strategic plans for defense. Thus, in

various ways, the need for a closer integration of the NATO members was felt and expressed at the end of 1952. (See also ARMIES OF THE WORLD; EUROPEAN UNION; MIDDLE EAST; MUTUAL SECURITY PROGRAM.)

North Borneo: see BRITISH BORNEO.

North Carolina. A south Atlantic coast state, popularly known as the "Old North state" or the "Tar Heel state," North Carolina is one of the original 13 states of the union. Area: 52,712 sq.mi. (49,097 sq.mi. land, 3,615 sq.mi. water). Pop. (1950): 4,061,929 (tenth in United States) of which 1,368,101 (33.7%) were urban, 2,693,828 (66.3%) rural and 1,096,720 (27%) nonwhite. Capital: Raleigh, with pop. (1950) 65,679; other cities: Charlotte (134,042); Winston-Salem (87,811); Greensboro (74,389); Durham (71,311); Asheville (53,000).

History.—In the Democratic primary held in May 1952, William B. Umstead, former member of the United States senate and house of representatives, in a close election race defeated Hubert E. Olive, superior court judge, for the Democratic nomination for governor. In other contests, Luther Hodges, industrialist, won the Democratic nomination for lieutenant governor and Hunt Parker, superior court judge, was nominated for the supreme court. The only major political upset occurred in the second congressional district when L. H. Fountain defeated the veteran representative John H. Kerr. (Democratic nomination in North Carolina is virtually tantamount to election.)

As Gov. W. Kerr Scott's four-year term neared its end, his "Go Forward" program of rural road construction, rural electrification and telephone service, public education, and public health and welfare approached its goals. By June 30, with funds from the \$200,000,000 state bond issue approved in 1949, 11,448 mi. of secondary roads had been paved (95% of the 12,000-mi. goal) and 15,571 mi. had been stabilized for all-weather travel (44.5% of the 35,000-mi. goal). An extensive school building expansion program, aided by \$50,000,000 of state funds, neared completion in 1952.

North Carolina's five-year medical, hospital and health program, begun in 1947, moved toward completion in 1952. The school of dentistry opened in 1951 and the four-year medical school and teaching hospital at the University of North Carolina, Chapel Hill, were opened in September. Of 127 hospital projects, 70 had been completed prior to June 30, 1952, 31 were under construction and 28 were in the planning stage.

The completion of extensive dock and storage facilities at Morehead and Wilmington, financed by a state bond issue of \$7,500,000, realized an age-old dream of the state for deep-water seaports.

The principal state officers in 1952 were W. Kerr Scott, governor; H. P. Taylor, lieutenant governor; Thad Eure, secretary of state; Henry L. Bridges, auditor; Brandon P. Hodges, treasurer; Charles Carroll, superintendent of public instruction; Harry McMullan, attorney general; William A. Devin, chief justice.

Education.—In 1950-51 there were 2,697 public elementary schools with 21,986 teachers, principals and supervisors and 719,855 enrolled pupils; and 957 high schools with 8,122 teachers, principals and supervisors and 189,922 enrolled pupils. These schools were operated at a cost of approximately \$123,000,000, including \$11,000,000 of federal funds. The average daily attendance in the public schools was 816,036; the number of inhabitants of school age (6-20, inclusive) was 1,118,283. The average salary for elementary school teachers was about \$2,890 and for high school teachers \$2,870.

Table I.—Principal Crops of North Carolina

Crop	Indicated 1952	1951	Average 1941-50
Tobacco, lb.	942,950,000	998,990,000	736,834,000
Cotton, 500-lb. bales	500,000	542,000	523,000
Corn, bu.	55,075,000	67,611,000	59,560,000
All hay, tons	1,182,000	1,225,000	1,266,000
Peanuts, for nuts, lb.	248,750,000	315,210,000	299,494,000
Wheat, bu.	7,917,000	8,763,000	6,693,000
Sweet potatoes, bu.	4,410,000	3,760,000	6,850,000
Irish potatoes, bu.	5,880,000	6,909,000	9,572,000
Oats, bu.	14,070,000	14,271,000	9,495,000
Soybeans, for beans, bu.	4,848,000	4,950,000	3,142,000
Peaches, total crop, bu.	1,648,000	1,806,000	1,867,000
Apples, commercial crop, bu.	2,053,000	1,269,000	1,090,000
Pecans, total crop, lb.	2,470,000	2,435,000	2,414,000

Table II.—Value of Products Manufactured by Leading Industries in North Carolina

	1951	1950
Textiles	\$2,688,000,000	\$2,282,000,000
Tobacco	1,284,000,000	1,023,000,000
Foods	478,000,000	365,000,000
Chemicals	343,000,000	248,000,000
Lumber	305,000,000	254,000,000
Paper	244,000,000	182,000,000
Furniture	239,000,000	210,000,000

Social Insurance and Assistance, Public Welfare and Related Programs.—In June 1952, public grants amounting to \$1,265,480 were made to 51,412 persons for old-age assistance; \$827,030 to 17,156 families for aid to dependent children; \$144,924 to 5,200 persons for aid to the permanently and totally disabled; \$153,358 to 4,436 blind persons; and \$43,870 to 2,101 cases for general relief. For hospitalization of assistance recipients and other indigent persons the total amount expended for June was \$153,951. During the year ended June 30, 1952, the total amount of public relief funds distributed was \$27,930,667, and unemployment benefits amounted to \$23,188,582.00.

In 1952, the state maintained 12 charitable institutions with 12,392 inmates on June 30; 5 correctional institutions with 769 inmates; and the state prison system with 8,925 prisoners.

Communications.—In 1952 the state highway and public works commission maintained 11,741 mi. of state highways, of which 11,397 mi. were hard-surfaced; and 54,806 mi. of county roads, of which 15,465 mi. were hard-surfaced. There were 4,521 mi. of railroads, 870 mi. of city bus routes and 11,912 mi. of passenger bus routes in 1952. There were 119 airports. There were 630,265 telephones in use in the state on June 30, 1952.

Banking and Finance.—On June 30, 1952, there were 71 national banks and branches with assets of \$551,071,000, and 400 state banks and branches with deposits of \$1,420,548,852 and assets of \$1,566,891,032. On Jan. 1, 1952, there were 146 building and loan associations operating under state charters with 202,251 members and total assets of \$239,332,494.16 and 31 federal savings and loan associations with total assets of \$138,220,622.61. In 1951-52 state receipts were \$644,622,173.94; disbursements \$724,251,638.68. On June 30, 1952, the state gross bonded debt was \$273,443,500, less bonds invested in sinking funds, \$65,496,159.05. The assessed value of property was \$4,704,295,148 on June 30, 1952. In the state general fund there was a cash surplus of approximately \$38,621,568 at the end of the 1952 fiscal year.

Agriculture.—The cash income of North Carolina farmers in 1951 was \$751,838,000 from crops; \$195,458,000 from livestock and livestock products; and \$8,032,000 from government payments. The value of the lands and buildings on the 288,508 farms in March 1952 was \$2,355,000,000.

Manufacturing.—North Carolina is the nation's largest producer of textile, tobacco and wooden furniture products, and in recent years

Table III.—Mineral Production of North Carolina

(Short tons, except as noted)			
Mineral	1950	1949	
	Quantity	Quantity	Value
Clays	1,437,000	1,181,000	\$ 1,336,000
Feldspar	204,000	180,000	974,000
Mica, scrap	48,000	25,000	640,000
Sheet (lb.)	484,000	470,000	121,000
Sand and gravel	8,352,000	5,093,000	3,553,000
Stone	7,712,000	6,225,000	10,078,000
Talc	117,000	86,000	1,345,000
Titanium concentrates	27,000	32,000	*
Tungsten concentrates (60% WO ₃)	1,240,000	1,000	*
Other minerals	1,708,000
Total			\$ 26,343,000
			\$19,755,000

*Value included with other minerals.

chemical and paper manufacturing had experienced notable growth. In 1951 manufacturing establishments numbering 8,272 employed 425,000 wage earners at wages of about \$1,000,000,000. Estimated industrial production in 1951 was \$6,181,000,000, and electric power generating capacity was 1,574,360 kw., an increase of 31% in four years.

(Jo. C. S.)

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in North Carolina in 1949 and 1950, listing all

items with value exceeding \$100,000. Data for 1951 were not yet available. North Carolina ranks 1st among the states in the production of feldspar and mica, and 2nd in talc and tungsten, and stands 36th in the value of mineral output, with 0.22% of the U.S. total.

North Dakota. A west north central state of the United States, North Dakota was admitted to the union Nov. 2, 1889; popular name, "Flickertail state." Area: 70,665 sq.mi., including 608 sq.mi. of water. Pop. (1950 census): 619,636. Urban population (places of 2,500 or more), 26.6%. Capital, with 1950 pop., Bismarck (18,640); chief cities: Fargo (38,256); Grand Forks (26,836); Minot (22,032).

History.—State officers in 1952 were: governor, C. Norman Brunsdale; lieutenant governor, Ray Schnell; secretary of state, Thomas Hall; auditor, Berta Baker; treasurer, Albert Jacobson; attorney general, E. T. Christianson; commissioner of insurance, A. J. Jensen; commissioner of agriculture and labour, Math Dahl; superintendent of public instruction, M. F. Peterson; tax commissioner, John Gray (died July 17; B. B. Conyne appointed in his place); public service commissioners, Elmer Cart, Ernest D. Nelson and E. H. Brant.

In 1952 the oil boom expanded. By October Amerada Petroleum corporation had 54 successful wells. In August 208,633 barrels of oil were sold, and 47 seismograph crews were operating.

In 1952 Garrison dam was about one-half completed. The total appropriation to date for the dam was \$179,180,700. The appropriation for the fiscal year 1951-52 was \$37,083,700, for 1952-53 \$30,848,000.

The June primary saw a Nonpartisan league victory in the bitter fight for the Republican senatorial nomination. William Langer, progressive leader of the N.P.L. seeking a third term, was opposed by Congressman Fred G. Aandahl for the conservative Republican Organizing committee. Supported by labour and Democratic voters, Langer won 107,905 to 78,359, though Aandahl charged him with supporting left-wing ideas and the Democratic administration. Brunsdale (R.O.C.) was renominated for governor, but the N.P.L. took most of the state offices and control of the house (Republican nomination is generally equivalent to election). Three constitutional amendments passed: removal of the two-term restriction on sheriffs; investment of school funds in federally insured farm mortgages; relocation of the school for the blind. Parking meters were voted down for the third time.

Education.—Public school teaching positions for the year ended June 30, 1951, were 6,688; public school enrolment 115,877 (elementary 88,617; high school 27,260); schools in session 3,268; average annual salary of teachers including city superintendents \$2,274; average cost per pupil enrolled \$202; total expenditure for public elementary and high schools \$25,282,550. Enrolment in 12 institutions of higher learning with 541 in the faculties in the fall of 1952: 6,611 college students; 487 special students.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ending June 30, 1952, public assistance totalled \$8,701,396 (federal 45.4%, state 38.3%, county 16.3%). Old-age assistance cost \$5,706,862 (the number of cases in June 1952 was 8,805). Aid to dependent children cost \$1,826,775 (4,550 children in June 1952); aid to the blind \$75,479 (112 persons in June 1952); aid to the permanently and totally disabled \$423,908 (653 persons in June 1952); general assistance \$491,330 (735 cases in June 1952); welfare services \$161,782; administrative expense \$787,882. Total expenditures for four charitable and four correctional institutions for the year ending June 30, 1952, \$4,151,177.95. Number of inmates in Sept. 1952: feeble-minded 1,169; insane 2,094; blind 32; deaf 72; tubercular 278; penitentiary 202; training school 242; state farm 33.

Communications.—For the calendar year 1951 the highway mileage was: state 6,862; rural 107,010. Spent in 1951 for construction of state highways: \$4,843,557 by the state; \$4,818,759 by the federal government. For maintenance of state highways \$3,118,088; for operation \$648,087. Additional amounts appropriated to the counties were: from motor fuel taxes \$1,409,078; from motor vehicle fees \$2,772,532. Motor vehicle registration in 1952 up to Aug. 31: 185,205 passenger cars, 86,355 trucks. Six railroads operated 5,259 mi. of track.

Banking and Finance.—On June 30, 1952, the Bank of North Dakota and 110 other state banks had resources of \$353,530,850.46 and deposits of \$329,663,068.89. Resources of 40 national banks were \$273,010,100, and deposits were \$256,155,000. State treasury collections for the year ended June 30, 1952, were \$77,797,996; disbursements \$71,797,379.

Table I.—Leading Agricultural Products of North Dakota

Crop	1952 (estimate of Sept. 1)	1951	Average 1941–50
Wheat, bu.	102,309,000	150,975,000	140,940,000
Barley, bu.	23,982,000	23,332,000	26,010,000
Oats, bu.	36,915,000	56,811,000	66,413,000
Rye, bu.	32,208,000	51,336,000	50,917,000
Flax, bu.	1,518,000	2,562,000	4,724,000
Seed, bu.	12,984,000	15,272,000	11,184,000
Potatoes, bu.	16,280,000	15,580,000	19,872,000
Hay, tons	2,973,000	3,163,000	3,114,000

Source: U.S. Department of Agriculture.

Total bonded indebtedness \$33,305,250.

Agriculture.—For the fiscal year ended in 1951 co-operatives in North Dakota (grain elevators, oil companies, creameries, stores, mutual insurance companies and credit unions) had 198,258 stockholders, total assets of \$88,298,005, and transacted \$257,888,780 worth of business. Drought struck North Dakota in 1952. April was the driest on record; May was the driest May since 1934. When the drought broke with a state-wide soaking rain on June 28, the small grain outlook was the poorest since 1936. But July saw a record improvement. Black stem rust damaged late durum; the durum crop was the smallest since 1936.

Manufacturing.—Nonagricultural employment in 1952 (January to August) averaged 113,010 (0.6% above 1951). The increase was largely the result of oil activity in the state. Manufacturing employment, 6,360. Construction employment declined from the 1951 level. For the first eight months of 1952 manufacturing workers averaged \$62.33 a week compared with \$59.11 in 1951. Average work week increased from 44.1 hours in 1951 to 44.6 hours in 1952. Average hourly earnings increased from \$1.34 in 1951 to \$1.40 in 1952. (E. R.N.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in North Dakota in 1949 and 1950, listing all items with value exceeding \$100,000. Data for 1951 were not yet available.

Table II.—Mineral Production of North Dakota

Mineral	(Short tons)			
	1950	Value	1949	Value
Coal	3,261,000	\$7,758,000	2,967,000	\$7,004,000
Oil and gravel	4,271,000	1,660,000	4,371,000	1,638,000
Stone	193,000	136,000	?	?
Other minerals	60,000	...	176,000
Total		\$9,614,000		\$8,818,000

*Value included with other minerals.

North Dakota ranks 43rd among the states in the value of mineral output, with 0.08% of the U.S. total.

Northern Ireland: see IRELAND, NORTHERN.

Northern Rhodesia: see RHODESIA, NORTHERN.

Northwest Territories. The Northwest Territories comprise all that part of Canada north of the 60th parallel of north latitude, except the portions thereof within the Yukon territory and the provinces of Quebec and Newfoundland; it also includes the islands in Hudson bay, James bay and Ungava bay, except those within the provinces of Manitoba, Ontario and Quebec. Area: 1,304,903 sq.mi., of which 51,465 sq.mi. are water; pop. (1951 census) 16,004, including 5,344 whites, 3,803 Indians and 6,857 Eskimos.

For purposes of organization and administration, the territories were divided by order in council dated March 16, 1918, into the districts of Mackenzie (527,490 sq.mi.), Keewatin (228,160 sq.mi.) and Franklin (549,253 sq.mi.). The Northwest Territories act, 1905, as amended, provides for the government of the territories by a commissioner (who, during 1952, was deputy minister of the department of resources and development) under instruction given from time to time by the governor in council or the minister of resources and development. Legislative powers are exercised by the commissioner in council. This council consists of eight members, one of whom is deputy commissioner. Five of the members are senior federal officials appointed by the governor in council and three are elected by the people to represent three constituencies in the Mackenzie district. In 1952 the council was headed by Maj. Gen. H. A. Young. Appointed council members were F. J. G. Cunningham, deputy commissioner, L. C. Audette, W. I. Clements, D. M. MacKay and L. H. Nicholson. Council members elected in Sept. 1951 for a three-year period were James Brodie, Frank Carmichael and Mervin Hardie. The seat of government is at Ottawa, Ont.

Education.—Federal schools were operated in 1952 by the department of resources and development at Fort Smith, Hay River, Fort Simpson, Fort Resolution, Aklavik, Coppermine, Tuktoyaktuk, Chesterfield Inlet, Cape Dorset on Baffin Island, Coral Harbour on Southampton Island and also at Fort Chimo and Port Harrison in the province of Quebec. A number of these schools were for Eskimos. A school was operated by the Discovery Yellowknife Mines, 60 mi. N. of Yellowknife, and one was also operated by Eldorado Mining and Refining (1944) Ltd. at Port Radium. The Indian affairs branch of the department of citizenship and immigration operated schools at Rae, Fort McPherson, Rocher River, Fort Good Hope, Fort Norman, Fort Franklin and Arctic Red River. Schools were operated at a number of the settlements by missions of the various churches with financial assistance from the federal government. The only organized school districts are at Yellowknife where an 11-room public and high school was in operation and a separate school district was established July 11, 1951. Construction of a separate school was commenced in July 1952. Correspondence courses were available free of charge to any child whose parents might request this service, as well as to adults wishing to enrol. As of March 1952 there were 1,294 pupils enrolled in grades 1-12 at schools in the Mackenzie district. Approximately 503 pupils attended government and mission schools for Eskimos in the eastern arctic.

Public Health and Welfare Services.—In the majority of the settlements, the schools are staffed by welfare teachers who attend to the general welfare of their communities.

During 1952 there were in operation eight mission hospitals, two company hospitals and one community hospital. Eight nursing stations and health centres were also operated. A physician and dentist accompanied the eastern arctic government supply ship for the purpose of treating anyone requiring professional service at points of call; working as a team, they also visited many settlements to conduct physical examinations and X-ray surveys and administer preventive inoculations.

Transportation and Communications.—A direct inland water transportation route for a distance of about 1,700 mi. is provided by the Mackenzie river and its tributaries, the Athabaska and Slave rivers. Subsidiary routes on Lake Athabaska, Great Slave lake and Great Bear river and lake total more than 800 mi. The Mackenzie highway, connecting Grimshaw, Alta., with Hay River on Great Slave lake, continued to provide useful service during 1952. Scheduled air-mail, passenger and express services were operated throughout the year to most of the settlements in the Mackenzie district.

Radio communication between nearly all settlements and trading posts in the territories and outside points was maintained through government and private radio stations.

Eastern Arctic Patrol.—The 1952 annual eastern arctic patrol was carried out by the government ship "C. D. Howe," assisted by small privately owned vessels. Replacement personnel as well as supplies were transported by this patrol for Royal Canadian mounted police detachments, medical centres, radio and weather stations, trading posts, missions and schools. Government officers reported on such matters as Eskimo economy, food, health conditions, trading, administration of family allowances, relief and old-age pensions, education, social conditions and vital statistics.

The Canadian Handicrafts guild, assisted by a grant from the Northwest Territories administration, helped to supplement the income of the Eskimos by encouraging the handicraft industry. In 1952 Eskimos produced for commercial marketing carvings in stone, ivory and wood, as well as articles fabricated from various skins and furs.

Agriculture and Fisheries.—Limited farming and horticultural activity was carried out at several settlements in the Mackenzie district. This work was actively encouraged and assisted by the department of agriculture. Many varieties of vegetables were successfully grown, as well as several types of grain. A commercial garden was operated at Yellowknife.

During the summer season of 1951 and the winter season of 1951-52 commercial fishing on Great Slave lake produced a total catch of 7,133,800 lb. with a market value of \$2,178,627. Whitefish, lake trout and inconnu were the principal species taken.

Fur Trading.—Fur production in the territories during the year ended June 30, 1951, was valued at \$2,038,339 with a total of 643,579 pelts taken during that period. Muskrats constituted about 80% of the catch. Trapping continued to be the principal occupation of the native population, and was strictly controlled by regulations. Four semidomesticated reindeer herds were maintained by the federal government in the Mackenzie delta region for the benefit of the native population; three of these herds were under Eskimo management.

The government also maintained buffalo herds in Wood Buffalo park with a view to the preservation and protection of this valuable animal species in its natural habitat. The taking of big game and fur-bearing animals found in this park is governed by the Wood Buffalo park game regulations. A limited slaughter of reindeer and buffalo for meat production is carried out annually. Some reindeer meat was sold to residents and both reindeer and buffalo meat was donated to mission hospitals and schools and to the Indian affairs branch of the department of citizenship and immigration.

Production and Industry.—Mineral production in the Northwest Territories during 1951 was valued at \$8,288,747, of which gold accounted for \$7,819,975. Crude oil production was continued at Norman Wells on the Mackenzie river and amounted to 227,449 bbl. After being processed at the local refinery, the oil was shipped to various points on the Mackenzie river. (H. A. Y.)

Norway. A democratic monarchy of northern Europe, Norway is bounded north by the Arctic ocean, east by Finland, the U.S.S.R. and Sweden, south and west by the North sea. Area: 125,182 sq.mi. Pop. (1951 est.) 3,294,000. Capital: Oslo, 420,000. Other principal cities (1946 census): Bergen,

107,293; Trondheim, 56,522; Stavanger, 49,173. Religion: Lutheran Christian. Ruler in 1952: King Haakon VII. Prime minister: Oscar Torp.

Spitsbergen (Svalbard), Norwegian since 1925, is an archipelago lying about midway between northern Norway and the north pole. Area: 23,979 sq.mi. Pop. (1949): about 1,600 Norwegians and an estimated 2,350 Russians.

History.—Norway's defense program was of special interest in 1952 because it represented what a small country with eager will but meagre resources could accomplish. For a coast line of 2,125 mi., fjords and inlets extending 12,500 mi. and 150,000 islands, Norway could muster 30,000 conscripts in 1940, but only 25,000 in 1945 and 18,800 by 1955, as a result of the declining number of births. The defense plans of 1946-49 called for a \$60,000,000 capital outlay and the expenditure of \$36,000,000 per year. This meant 4% of national incomes and 19% of the budget. Circumstances forced steady increases in these expenditures. The new plan for 1952-55 called for outlays of \$125,000,000 per year—about 8% of the national income, or more than 28% of the budget.

These expenditures were to provide, by the end of 1952, for an army of four field divisions, 50% above 1950 strength, and for a similar increase in the air force. The home guard, organized under army command, was to have 120,000 men uniformed and equipped, plus 45,000 volunteers; 121,700 were training in the rifle clubs. The women's auxiliary numbered 25,000. For the army the basic training period had been raised from 9 months to 12 months, with 60-day refresher courses; it was to be increased further to 18 months. The navy was being augmented, but in early 1952 it numbered 95 units, including 9 destroyers, 6 minesweepers, 8 submarines and 18 motor torpedo boats. Many merchant ships were also equipped for war service—in one of the world's largest and best merchant fleets. The air force, to have 11 fighter squadrons by the end of 1952, was in process of changing from British Vampire jets to U.S. F-84 Thunderjets. New air fields in Norway were to be built with aid from the North Atlantic Treaty organization.

Since Jan. 1947, the Norwegians had supplied a field brigade of 4,400 men in Germany. Their contributions to the Korean war included appropriations of \$4,000,000 and the establishment of a 120-bed mobile hospital.

Norway was pushing vigorously to increase industrial production. In 1951 the level was 50% above that of 1938. Export industry had risen in 1951 to 9.5% above 1950; there was a good surplus in foreign payments accounts, but still a shortage in dollars. Falling prices for pulp, paper, wood and whale oil forecast continued stringency. But the merchant fleet was increased to more than 6,000,000 tons, and the 1951-52 logging season saw the cutting goal surpassed by 9%; the total fall was 270,000,000 cu.ft. In April 1952 the Sydvaranger iron ore mines resumed operation (aided by \$5,000,000 of Marshall plan equipment); production for 1952 was forecast at 500,000 tons and for 1953 at 1,000,000 tons. The ten-year plan for north Norway envisioned expenditure of \$10,000,000 for the expansion of fishing, farming, mining, manufacturing, communications and power.

The great debate of the year resounded over the price and industry control bill proposed by the government. Commerce, industry and handicraft groups protested strenuously in early July, and the bill was modified before it was publicized again in September. One of the proposals that was abandoned had provided that a private business could be forced to join with another or be taken over by government if the government authority decided it was operating uneconomically; another cancelled paragraph would have freed the price directorate from all other laws but this one, with itself as the judge of its actions.

Despite such ameliorations, the bill was still a far-reaching measure of government control, giving power to set maximum and minimum prices, and to control earnings, agreements, quality, production, replacement, etc. The government argued that in a country of 3,000,000 people competition did not function in any case, and that to guarantee full employment, increasing productivity and equal wages the state must regulate.

On Jan. 5 Jens Christian Hauge resigned as minister of defense; he was replaced by Nils Langhelle, whose post as minister of communications was taken by Jakob Pettersen.

The long-standing dispute with Great Britain over the method of measuring the territorial limits of Norwegian waters was settled by a decision of the International court at The Hague. The Norwegian contentions that the lines should be drawn from headland to headland were judged valid; the result was to give Norway undisputed control of fishing and shipping areas much farther out than previously recognized. (F. D. S.)

Education.—Schools (1948-49): rural elementary 5,497, pupils 226,284; urban elementary, pupils 73,890; secondary 306, pupils 39,921. Universities (1950): 2, students 4,046; other institutions of higher education (excluding teachers' training colleges) 6, students 1,723.

Finance and Banking.—Budget: (1951-52 est.) revenue kr. 3,668,000,000, expenditure kr. 3,230,000,000; (1952-53 est.) revenue kr. 4,053,000,000, expenditure kr. 3,715,000,000. National debt (June 30, 1951): kr. 10,281,000,000, including balance of occupation account kr. 6,202,000,000 and foreign debt kr. 1,151,000,000. Currency circulation (Aug. 1952) kr. 2,569,000,000. Deposit money (July 1952) kr. 6,082,000,000. Gold and foreign exchange (Aug. 1952) U.S. \$146,500,000. Monetary unit: krone (plural kroner), with an exchange rate (Nov. 1952) of kr. 20 to the pound and kr. 7.15 to the U.S. dollar.

Foreign Trade.—(1951) Imports kr. 6,256,000,000; exports kr. 4,423,000,000. Main sources of imports (1951): U.K. 23%; Sweden 12%; U.S. 13%; Germany 8%. Main destinations of exports: U.K. 20%; Germany 9%; Sweden 8%; U.S. 7%. Main imports: ships and boats 14%; textiles 13%; coal, petroleum and products 11%; machinery 9%. Main exports: wood pulp and paper 30%; fish and products 14%; fats and oils 11%; nonferrous metals and manufactures 9%.

Transport and Communications.—Roads (1951): 45,128 km. Licensed motor vehicles (Dec. 1951): cars 73,507, trucks 60,392. Railways (1951): 4,472 km., including state railways 4,392 km.; traffic on state railways (1951): passenger-kilometres 1,519,000,000; freight net ton-kilometres 1,457,000,000. Shipping: merchant vessels, 100 gross tons and more (July 1952) 2,217, total tonnage 5,924,805. Air transport (1951): kilometres flown 8,900,000; passenger-kilometres 199,700,000; freight net and mail ton-kilometres 8,500,000. Telephones (1951): 781,678. Radio receiving set licences (1952): 818,750.

Agriculture and Fisheries.—Main crops (metric tons, 1951-52): wheat 40,000; barley 130,000; oats 180,000; rye 1,000; potatoes 1,015,000. Livestock (June 1951): cattle 1,231,000; sheep 1,929,000; pigs 386,000; goats 118,000; horses 184,000; chickens 4,689,000. Food production (metric tons, 1951): delivered milk 9,657,000 hl.; butter, factory production 11,200; cheese (factory production) 28,900; meat 97,000, including beef and veal 47,000, mutton and lamb 15,000, pork (excluding lard) 35,000. Wool production (clean basis, 1951-52): 2,000 metric tons. Fisheries (1951): total catch 1,818,680 metric tons, valued at kr. 480,000,000. Whale oil production (1951): 190,900 metric tons, valued at kr. 358,000,000.

Industry.—Industrial establishments employing 5 workers or more, excluding electrical plants and construction and building industries (1950): 6,166; persons employed: 38,134 salaried staff and 219,265 workers; gross value of production: kr. 8,883,000,000. Fuel and power (1951): coal 470,400 metric tons; manufactured gas 47,500,000 cu.m.; electricity 17,216,000,000 kw.hr. Timber production (1950): sawn softwood 1,227,000 cu.m. Raw materials (metric tons, 1951): iron ore (65% metal content) 438,000; pig iron 241,200; copper, smelter 8,640; zinc, smelter 40,200; aluminum, smelter 51,200; nickel 11,000; ferrosilicon (calculated 45% basis) 72,100; sulphur 98,400; pyrites 692,900; nitrogen 168,400; wood pulp (dry basis) 553,900. Manufactured goods (metric tons, 1951): cellulose, dry basis 529,300; newsprint 169,000; other paper and board 340,000; cement 720,000. Merchant vessels launched, 100 gross tons and more (1951): 50; total tonnage 73,107. Index of industrial production (1951 [1948=100]): general index 119, producers' goods 119, consumers' goods 119.

Nose and Throat, Diseases of: see EAR, NOSE AND THROAT, DISEASES OF.

Nova Scotia. Second smallest of the Atlantic provinces of Canada, Nova Scotia entered the confederation in 1867. Area: 21,068 sq.mi. Pop. (1951): 642,584. Capital: Halifax, pop. (1951) 85,589.

History.—The third session of the 21st provincial legislature met on Feb. 12, 1952, and was informed by Liberal premier Angus L. MacDonald that provincial revenues continued to fall short of increased costs of public services and administration.

The province received about \$3,000,000 additional revenues from the new federal tax plan, but that amount was less than expected because the population had not increased as rapidly as anticipated. Increased taxes therefore came under consideration, and a ten-cent per ton levy was imposed on gypsum, which was heavily mined in Nova Scotia and previously untaxed. The federal government undertook restoration of the citadel hill fort, built in 1749 and said to have been once the strongest in North America; \$1,000,000 was earmarked to preserve it as a national historic site.

Education.—The provincial government refused to foot the educational bill beyond the 65% of the total cost it already paid, and the controversial teachers' salaries question provoked a rash of strikes. The problem was not aided by the abolition of the 80-year-old municipal school fund, closing of which increased the financial burdens of rural municipalities.

Health and Welfare.—The Nova Scotia health survey committee reported a number of recommendations, including: more co-operative federal, provincial and municipal planning; development of a system of government subsidies and grants, together with low-cost voluntary prepayment insurance plans, to build up medical care, dental and hospital facilities.

Transportation and Communication.—In April the first sod was turned for the Halifax-Dartmouth suspension bridge, to cost \$8,000,000.

Forestry.—Large-scale lumber operations during the winter of 1951-52 created a lumber boom that topped any similar postwar period. The 1950-51 season, considered relatively poor, saw 32,300,000 bd.ft. of lumber produced, which was 40% more than the 1939 production. The provincial forest conservation plan was extended by a ban on cutting small trees.

Industry.—Industrial and employment buoyancy was reflected in various indexes. In 1939 the employment index was 100.0 and the aggregate pay rolls index was 100.0; the average weekly earnings (salaries and wages) were \$21.42. In 1951 the employment index was 149.4; the pay rolls index was 296.4; the weekly earnings, \$42.51. In July 1952 the respective figures were 160.2, 341.5 and \$45.66. (C. Cy.)

Nursing: see HOSPITALS.

Nutrition, Experimental. Experiments by J. Mayer and M. W. Bates, concerned with the relationship between blood sugar levels and food intake in rats, were reported during 1952. An attempt was made to determine whether elevation or depression of blood sugar levels within physiologic limits could significantly influence food intake.

Comparisons were also made of the effect on food intake of nutrients which were capable of exerting a direct influence on blood sugar with that of preparations of similar caloric value which did not directly affect blood glucose levels. The results indicated that the procedures which induced an increase in blood sugar without appreciably decreasing utilization of glucose were accompanied by significant reductions in food intake.

The investigators acknowledged that there is a problem involved in applying their "glucostatic" theory of food intake regulation to conditions associated with chronically abnormal levels of blood glucose, such as diabetes mellitus. Although they implied that a quantitative relationship between carbohydrate utilization and food intake regulation may exist, the investigators made no attempt to carry their thesis to this point.

The problem of the origin of the urge to eat is one of the oldest in nutrition and physiology. Its study is associated with many of the great names in the history of these sciences. In view of the many advances in the existing knowledge about the intermediary metabolism of foodstuffs, it was natural to wonder whether the interesting correlation between variations in blood glucose and food intake could not now be quantitated.

It had been known for years that soil fertility is important to human welfare because of its influence on the production of crops. Conflicting claims had appeared regarding the influence of soil fertility on the nutritional quality of crops or animal products. A long-term study was initiated at the Michigan Agricultural Experiment station in 1945 and was planned for continuation for at least a ten-year period. The study was designed to answer the following question: Does the fertility of the soil affect the nutritive value of the crops, the nutrition of the

CHILDREN SKIPPING ROPE in a sealed respiration chamber during a series of energy expenditure tests conducted for the U.S. department of agriculture in 1952. Results of the tests were to help set standards for school lunches and famine relief shipments

cow, the nutritive value of the milk and, ultimately, the health of the consumer?

Ten pairs of heifers (from cows bred to the same sire) were selected for the experiment. One of each pair received feeds grown on well-fertilized soil and the other received feeds grown on the same type of soil, but which was severely depleted and unproductive. The crops selected to serve as feed were those that would most likely grow satisfactorily on both the fertile and the depleted soil. Brome grass and timothy were grown as the hay component of the ration and soybeans were grown as a protein supplement. Corn, wheat and oats were grown as the grain components of the ration. Yields per acre from the depleted soil were only about one-half those from the fertilized soil.

Both groups of cows were managed identically, were maintained on the same plan of nutrition for full milk production, and consumed approximately the same amounts of digestible protein and total digestible nutrients. The heifer calves were being retained in the respective herds as replacement stock, and provided a means of ascertaining the cumulative effects on later generations of the continued use of feeds grown on depleted as well as on fertile soil.

The essential amino acid content of colostrum and milk proteins from the animals in the two herds was reported. The essential amino acid content of the colostrum and milk proteins and also the protein content were not affected by the level of soil fertility. The Michigan workers concluded that the amount and kinds of amino acids in milk proteins remain rather constant

irrespective of the soil fertility conditions under which the cow's feed is grown. In the initial report the nutritive value of the milk from the herds was tested in feeding experiments with rats. No differences could be detected that were traceable to soil fertility. The conclusion was drawn that, based on data accumulated over a five-year period, there is no justification for assuming that the level of soil fertility can influence the quality of cow's milk. This was in no way meant to imply that farmers should not use fertilizers. On the contrary, the economic advantages of improved crop yields from fertilization of depleted soils are usually tremendous.

It should be remembered that the composition and nutritive value of milk is difficult to alter. Serious deficiencies, such as deficiencies of calcium or phosphorus, bring about a decline in milk production and seriously affect the health of the cow, yet have little or no effect in modifying the composition or quality of the milk.

A study was made of the effect of the "poor rice diet" of south India on the growth of rats, and the results from supplementation with egg yolk, egg yolk extracts, casein and riboflavin. The investigations were designed to show whether the fat-soluble or nonfat-soluble nutrients of egg yolk were effective to account for the known nutritive value of whole egg yolk in animals maintained on this rice diet. It was found that the animals fed the basal rice diet from the beginning with a supplement of 30% egg yolk gained weight well, and that the addition of the other above supplements and also cod-liver oil did not increase the rate of gain in weight.

Many of the antibiotics such as penicillin, streptomycin, terramycin and aureomycin had been found to improve growth when they were added in small amounts to the ration of experimental animals. Aureomycin was one of the first antibiotics for which growth-promoting activity was suggested. The chick was used as the experimental animal. The observation was extended to the pig and turkey, as well as to the calf and rat. P. K. Vijayaraghavan, E. A. Murphy and M. S. Dunn extended the series of experimental animals, the growth of which can be stimulated by aureomycin, to include the laboratory mouse. They also showed that this effect seems dependent on the biologic value of the dietary protein.

The mechanism of this growth-stimulating activity of aureomycin or other antibiotics was unknown. Possible explanations might be inhibition of toxin-producing vitamin B₁₂ or other nutrients, or reduction of competition between host and flora for certain nutrients. It was also reported that aureomycin may have marked effects on the metabolism of mammalian tissues and in particular on phosphorylation reactions. Recalling the fact that the majority of positive reports on the action of aureomycin on growth were obtained, as in their experiments with mice, with diets containing plant proteins (soybean and cottonseed), it was postulated that antibiotics may promote the development of a microflora which enhances the availability or the intestinal synthesis of critical amino acids. When proteins of high biologic value are provided, such as is the case with diets containing peanut protein, or the mixture of proteins found in calf meal or casein, these amino acids are not limiting factors for growth and the favourable effect of aureomycin cannot be observed. This conclusion appeared to be a reasonable hypothesis, which could eventually be tested experimentally by adding the pure amino acids likely to be the least available to the diets showing the aureomycin effect, and seeing whether one or a mixture of these supplements does, in fact, cancel the aureomycin effect. (See also VITAMINS AND NUTRITION.)

Chem., 196:33-43 (May 1952); P. K. Vijayaraghavan, E. A. Murphy and M. S. Dunn, "The Effect of Aureomycin on the Growth of Mice," *Arch. Biochem.*, 36:127-131 (March 1952). (F. J. Se.; M. F. T.)

Nuts. The U.S. tree nut crops of 1952 were all indicated as above average, though pecans and almonds were less plentiful than in 1951. Of the 127,256,000 lb. of 1952-crop pecans, 18% less than the 154,895,000 lb. of 1951, about half, or 64,187,000 lb., were improved varieties, down 26% compared with 86,660,000 lb. in 1951, but above the 54,026,000-lb. average for 1941-50.

The California almond crop was indicated at 35,300 tons, compared with 42,700 tons in 1951 and an average for 1941-50 of 31,140 tons. The Mediterranean basin crop was forecast at 92,000 short tons (shelled basis), exceeded only by 98,700 tons in 1950, and large compared with 66,600 tons in 1951. Exports from this area's 1951 crop were 50,700 tons, or 76% of the crop, as against 78,000 tons from that of 1950. Pres. Harry S. Truman, in September, acting under the Agricultural Adjustment act, after investigation by the tariff commission, proclaimed an additional duty of five cents per pound (additional to a 16½-cent per pound duty) on shelled almond imports, up to 7,000,000 lb., ten cents per pound on additional amounts.

The filbert crop, grown mostly in Oregon, was indicated at a record 11,550 tons of average quality, 67% above the 6,920 tons of 1951 and compared with an average for 1941-50 of 7,021 tons. The world crop of 99,840 tons was a small one, whether measured against the 1941-50 average (110,200 tons) or the 143,720 tons of 1951.

English walnuts, mostly a California crop, were estimated at 80,100 tons, compared with 77,400 tons in 1951 and an average of 69,700 tons. The crop in Mediterranean basin countries was estimated at 73,500 tons, compared with 51,200 tons in 1951 and 41% more than the 1941-50 average of 52,000 tons.

The Indian cashew nut crop of 1952 of 48,700 tons was equal to the ten-year average, but moderately smaller than 1950 or 1951. (See also PEANUTS.) (J. K. R.)

Nyasaland. Nyasaland is a British protectorate in central Africa. Area: (including lakes) 48,444 sq.mi.; (land only) 37,928 sq.mi. Pop.: (1945 census) 2,049,914, including 1,948 Europeans; (1951 est.) 2,400,000, including c. 4,000 Europeans and c. 5,000 Asiatics. Religion: pagan, with Christian minority. Chief towns: Zomba (cap.; pop. 1949, 7,434), Blantyre, Limbe. Governor in 1952, Sir Geoffrey Colby.

Education.—(1951): European schools 5, pupils 683; Asian and coloured 9, pupils 645; African 4,600, pupils 241,941.

Finance and Trade.—Currency: sterling, with Rhodesian silver coinage. Budget: (1951 revised est.) revenue £4,095,854, expenditure £4,143,300; (1952 est.) revenue £3,964,593, expenditure £4,157,187. Foreign trade (1951): imports £7,293,756; exports £6,028,296. Principal exports (1951 values): tobacco £2,733,431, tea £2,028,866.

Communications.—Roads (1951) 4,765 mi.; railways 316 mi.

Oats. The 1,265,660,000-bu. oat crop of the United States in 1952 was 4% below that of 1951 and the average of 1941-50. Seeded acreage of 43,052,000 ac. was in excess of early intentions and about 4% above the government goal. But extremely high temperatures in June hastened maturity and reduced yields and grain test weights. Iowa was the leading producer (215,320,000 bu.), followed by Minnesota (203,819,000 bu.) and Wisconsin (130,118,000 bu.). Stocks of old oats on

Table 1.—U.S. Oat Crops

	1952	1951	Average 1941-50
Total production (thousands of bushels)	1,265,660	1,316,396	1,310,736
Acreage harvested (thousands)	38,682	36,454	39,667
Yields (bushels per acre)	32.7	36.1	33.0

Table II.—Oat Production of the Principal Producing Countries

Country	(In thousands of bushels)		
	1952*	1951	Average 1935-39
United States	1,265,660	1,316,396	1,045,329
U.S.S.R.	750,000†	750,000†	1,165,000
Canada	474,169	488,191	338,071
France	223,240	254,120	329,304
United Kingdom	178,500	183,120	138,628
Western Germany	178,000	195,000	194,500
Preliminary. For 1950.			

farms as of July 1 were 245,000,000 bu., 5% less than in 1951 but 12% above average. Imports into the United States from Canada in 1951-52 of about 60,000,000 bu. were the largest since 1944. A feature of 1952 was the sharp decline in prices by about one-fifth after the early part of the year. The official support price at the farm on the 1953 oat crop was announced as 80 cents per bushel, up from 78 cents on the 1952 crop.

The world crop, estimated at 4,115,000,000 bu., was below that of 1951 (4,295,000,000 bu.) or the pre-World War II average of 4,365,000,000 bu., primarily because of smaller crops in western Europe and the U.S. Canadian exports, and surpluses available there for export from old stocks and from the new crop, continued large.

(J. K. R.)

Obituaries.

The following is a selected list of prominent men and women, of the United States and other countries, who died during the year 1952:

Addison, Sir (Albert) Percy, British naval officer (b. Nov. 8, 1875—d. Lymington, Eng., Nov. 13, 1952).

Adler, Max, U.S. philanthropist (b. Elgin, Ill., 1866—d. Beverly Hills, Calif., Nov. 4, 1952), studied violin as a young man at the Berlin, Ger., Royal Conservatory of Music. After appearing in a number of concerts he took up a business career, becoming vice-president of Sears, Roebuck and company in Chicago before his retirement in 1928. He was the donor of Adler planetarium in Chicago, the first built in the United States—opened on the Chicago lake front in May 1930.

Agostini, Carlo, Italian Roman Catholic patriarch (b. San Martino di Lupari, near Treviso, It., April 22, 1888—d. Venice, It., Dec. 28, 1952), was ordained priest in 1910 and taught at the seminary at Treviso, of which he became rector before he was consecrated bishop of Padua in 1932. He became Latin patriarch of Venice in 1949. Monsignor Agostini had been among the 24 prelates designated as cardinals by Pope Pius XII on Nov. 29, 1952; he was to have received the red hat at Rome on Jan. 12, 1953.

Alda, Frances (FRANCES DAVIES), U.S. operatic soprano (b. Christchurch, N.Z., May 31, 1885—d. Venice, It., Sept. 18, 1952), studied music as a child in New Zealand and at the age of 17 sang in Gilbert and Sullivan productions in Melbourne, Austr. She later studied in Paris, where in 1904 she made her operatic debut at the Opéra-Comique, singing the title role in Massenet's *Manon*. At La Scala in Milan, It., in 1907 she met Arturo Toscanini, who was to become her lifelong friend, and the impresario Giulio Gatti-Casazza, whom she married in 1910 (they were divorced in 1928). Mme. Alda made her first appearance at the Metropolitan Opera in New York city in Dec. 1908 as Gilda in Verdi's *Rigoletto*, starring Enrico Caruso and Louise Homer. Thereafter, until her farewell performance at the Metropolitan 21 years later, she sang in more than 40 soprano roles and never missed a performance scheduled for her. After her retirement from a brilliant career in Dec. 1929 she continued to appear in concerts and on several series of radio programs; she also taught voice in New York city. In 1941 she married Ray Vir Den, an advertising executive.

Alexandrine, queen mother of Denmark (b. Schwerin, Dec. 24, 1879—d. Copenhagen, Den., Dec. 28, 1952), was born the Duchess Alexandrine-Augustine, elder daughter of the Grand Duke Friedrich-Franz III of Mecklenburg-Schwerin. She was married at Cannes on April 26, 1898, to Crown Prince Christian, eldest son of King Frederick VIII of Denmark. He succeeded his father in 1912 as King Christian X and died on April 20, 1947. Queen Alexandrine was notable for her sense of duty and for her love of music which her son, King Frederick IX, inherited from her.

Allen, Paul Hastings, U.S. composer (b. Boston, Mass., Nov. 28, 1883—d. Brookline, Mass., Sept. 28, 1952).

1952 OBITUARIES: Sveinn Björnsson, Icelandic statesman; Howard Chandler Christy, U.S. artist; Sir Stafford Cripps, British government official; Benedetto Croce, Italian philosopher; Jo Davidson, U.S. sculptor

Alonso, Amado, Spanish-American philologist and literary critic (b. Lerin, Sp., Sept. 13, 1896—d. Arlington, Mass., May 26, 1952).

Altglass, Max Mayer, Polish-born tenor (b. Warsaw, Pol., Feb. 16, 1895—d. New York, N.Y., Feb. 13, 1952).

Ames, Louis Annin, U.S. manufacturer and civic worker (b. St. Helena Island, S.C., Sept. 5, 1866—d. Essex Fells, N.J., Nov. 28, 1952).

Anderson, Sir Alan Garrett, British shipping executive and politician (b. March 9, 1877—d. London, Eng., May 4, 1952).

Aranow, Harry, Russian-born obstetrician and gynaecologist (b. Minsk, Russia, Aug. 20, 1878—d. New York, N.Y., July 31, 1952).

Arden-Close, Sir Charles Frederick, British cartographer and geographer (b. Aug. 10, 1865—d. Winchester, Eng., Dec. 19, 1952).

Armour, Laurance Hearne, U.S. banker and meat-packing firm executive (b. Kansas City, Mo., March 8, 1888—d. Chicago, Ill., Dec. 29, 1952).

Arosemena, Carlos Julio, Ecuadorian banker and government official (b. 1894—d. Guayaquil, Ecuador, Feb. 20, 1952).

Ascalesi, Alessio Cardinal, Italian Roman Catholic prelate (b. Casalnuovo, It., Oct. 22, 1872—d. Naples, It., May 11, 1952).

Ashe, Bowman Foster, U.S. educator (b. Scottdale, Pa., April 3, 1885—d. Coral Gables, Fla., Dec. 16, 1952), received his bachelor's degree in economics at the University of Pittsburgh, Pa., in 1912. From 1903 to 1914 he was a school teacher or administrator at various places in Pennsylvania; he then entered private business. He was an associate professor of economics and later student counsellor and university examiner at the University of Pittsburgh from 1920 to 1926, when he was appointed first president of the University of Miami, Fla. He held this position until his death.

Astor, Waldorf Astor, 2ND VISCOUNT, OF HEVER CASTLE, IN THE COUNTY OF KENT, British newspaper publisher and politician (b. New York, N.Y., May 19, 1879—d. Cliveden, Buckinghamshire, Eng., Sept. 30, 1952). (For details of his life, see *Encyclopædia Britannica*.)

Atherton, John C., U.S. artist, designer and writer (b. Brainerd, Minn., June 7, 1900—d. New Brunswick, Can., Sept. 15, 1952).

Austen, Alice Elizabeth, U.S. photographer (b. Staten Island, N.Y., 1866—d. West Brighton, Staten Island, June 9, 1952), was the daughter of a wealthy real estate agent and was educated at private schools in New York city and Staten Island. She adopted photography as a hobby when a young girl and in the next half century took, developed and printed more than 5,000 pictures. Their value as historical documents and as examples of a fine photographic technique was not discovered until near the middle of the 20th century, after she had presented the prints to the Staten Island Historical society. Ill and poverty-stricken by that time (she had lost her fortune following the 1929 stock market crash), she acquired belated recognition as one of the first and most proficient woman photographers in the United States.

Ayer, Nat(haniel Davis), British-U.S. composer of popular music (b. Boston, Mass., 1887?—d. Bath, Eng., Sept. 19, 1952), first attracted attention as one of the songwriters for the *Ziegfeld Follies* of 1909. Subsequently he moved to England where he composed the score for *The Bing Boys*, which opened in London in 1916 and was one of the musical successes of the period; his "If You Were the Only Girl in the World" from that play became an international hit song, exceeded only in popularity by his "Oh You Beautiful Doll." Ayer later wrote the music for several other musical plays produced in England.

Aylesworth, Allen Bristol, Canadian lawyer (b. Newburgh, Ont., Nov. 27, 1854—d. Toronto, Ont., Feb. 13, 1952).

Aylesworth, Merlin Hall, U.S. attorney and business executive (b. Cedar Rapids, Ia., July 19, 1886—d. New York, N.Y., Sept. 30, 1952).

Ayre, Sir Amos Lowrey, British shipbuilder (b. South Shields, Durham, Eng., July 23, 1885—d. London, Eng., Jan. 13, 1952).

Ayres, William Augustus, U.S. lawyer and government official (b. Elizabethtown, Ill., April 19, 1867—d. Washington, D.C., Feb. 17, 1952).

Azuela, Mariano, Mexican author and physician (b. Lagos, state of Jalisco, Mex., Jan. 1, 1873—d. Mexico City, Mex., March 1, 1952), was educated at the Faculty of Medicine and Pharmacy at Guadalajara, Mex., from which he received his medical degree in 1898. In his lifetime he wrote more than 20 novels, an anthology of Mexican prose, two biographies and a play. His best-known work, *Los de abajo* (1916), was translated into English by Anita Brenner as *The Under Dogs*, and was published in seven other languages as well. Other novels included *Mala yerba* (1909), *Las Moscas* (1918), *La Malhora* (1923) and *El Camarada* (1937). Azuela was one of the founders

- of the Mexican National College of Science and Arts in 1942 and was active in national education programs. He was awarded the 1950 National Literary prize, most coveted in Mexico, by Pres. Miguel Alemán. At the time of his death he was working on two novels and his memoirs.
- Babcock, Harriet** (MRS. H. HOBART BABCOCK), U.S. psychologist (b. Westerville, R.I., Jan. 7, 1877—d. New York, N.Y., Dec. 17, 1952), was educated at Columbia university, New York city, where she received her doctorate in 1930. From 1926 to 1928 she was chief psychologist at Bellevue hospital in New York city. An authority on mental deficiency, she was the author of *An Experiment in the Measurement of Mental Deterioration* (1930), *Dementia Praecox: a Psychological Study* (1933), *Revised Examination for the Measurement of Efficiency of Mental Functioning* (1941) and *Time and the Mind* (1941).
- Bancroft, Jessie Hubbell**, U.S. educator and author (b. Winona, Minn., Dec. 20, 1867—d. Pittsfield, Mass., Nov. 13, 1952).
- Barber, Thomas Gerrard**, British Anglican clergyman and author (b. Nottingham, Eng., 1875—d. Derby, Eng., Oct. 15, 1952).
- Barbour, Phillips T.**, U.S. editor (b. Louisville, Ky., June 17, 1884—d. New York, N.Y., Jan. 9, 1952).
- Bartlett, John Henry**, U.S. politician, former governor of New Hampshire (b. Sunapee, N.H., March 15, 1869—d. Portsmouth, N.H., March 19, 1952).
- Bartsch, Hans**, German-born theatrical producer (b. Germany, 1884?—d. Bullville, N.Y., July 10, 1952).
- Bartsch, Rudolf Hans**, Austrian novelist (b. Graz, Aus., Feb. 11, 1873—d. Graz, Feb. 7, 1952).
- Baskin, Joseph**, Russian-born labour leader (b. Biala, Minsk, Russia, Oct. 20, 1880—d. New York, N.Y., June 26, 1952).
- Bastie, Maryse**, French aviatrix (b. 1900—d. Lyons, Fr., July 6, 1952).
- Bear, Donald**, U.S. museum director and author (b. Seymour, Ind., Feb. 5, 1905—d. Los Angeles, Calif., March 16, 1952).
- Bedford, Frederick Henry, Jr.**, U.S. businessman (b. Brooklyn, N.Y., Sept. 15, 1891—d. Barranquilla, Colombia, Dec. 3, 1952).
- Bell, (Henry) Hesketh (Joudou)**, British politician (b. West Indies, Dec. 1864—d. London, Eng., Aug. 1, 1952).
- Bell, Sir Thomas**, British shipbuilder and marine engineer (b. Sirsawa, India, 1865—d. Helensburgh, Dumbartonshire, Scot., Jan. 9, 1952).
- Bellinger, Clarence Henry**, U.S. physician (b. Lebanon, N.Y., Feb. 22, 1887—d. New York, N.Y., Aug. 12, 1952).
- Belluzzo, Giuseppe**, Italian scientist, economist and politician (b. Verona, It., Nov. 25, 1876—d. Rome, It., May 22, 1952).
- Benians, Ernest Alfred**, British educator (b. Goudhurst, Kent, Eng., Oct. 23, 1880—d. Cambridge, Eng., Feb. 13, 1952).
- Benjamin, Raymond**, U.S. attorney and political leader (b. Vallejo, Calif., Dec. 14, 1872—d. Westport, Conn., June 18, 1952), was admitted to the California bar in 1893. He was district attorney of Napa county, Calif., from 1902 to 1908, chief deputy attorney general of the state from 1908 to 1919 and state superintendent of banks from 1919 to 1922. Meanwhile he had become active in Republican politics, serving as chairman of the Republican state committee from 1918 to 1922 and as regional director of the Republican national committee from 1918 to 1921; he was also assistant chairman of the latter organization from 1918 to 1936. A close friend and adviser of Herbert C. Hoover, Benjamin became known as the "Colonel House" of President Hoover's administration (1929-33), holding no public office but being consulted frequently on political matters.
- Béranger, Henri**, French diplomat and journalist (b. Rugles, Eure, Fr., April 22, 1867—d. Nice, Fr., May 18, 1952).
- Berninghaus, Oscar Edmund**, U.S. artist (b. St. Louis, Mo., Oct. 2, 1874—d. Taos, N.M., April 27, 1952).
- Bingham, Walter Van Dyke**, U.S. psychologist (b. Swan Lake, Ia., Oct. 20, 1880—d. Washington, D.C., July 8, 1952).
- Birley, Sir Oswald Hornby Joseph**, New Zealand-born portrait painter (b. Auckland, N.Z., March 31, 1880—d. London, Eng., May 6, 1952).
- Björnsson, Sveinn**, Icelandic statesman (b. Copenhagen, Den., Feb. 27, 1881—d. Reykjavik, Ice., Jan. 25, 1952), after graduating at Copenhagen university in 1907, went to Reykjavik and practised law in the superior court and later in the supreme court. He was active in the Independence (conservative) party and was a member of the *althing* from 1914 to 1916 and in 1920. Iceland being a sovereign state united with the Danish crown after Dec. 1, 1918, he was minister to Denmark from 1920 to 1924 and again from 1926 to 1941. When the Germans invaded Denmark he returned to Iceland and on June 17, 1941, was elected regent by the *althing*. On June 17, 1944, Björnsson was elected first president of the Icelandic republic. He was re-elected in 1945 and 1949.
- Black, George Harold**, Canadian-born educator (b. Georgetown, Ont., June 6, 1873—d. Palo Alto, Calif., Feb. 24, 1952).
- Blake, Francis Gilman**, U.S. medical educator (b. Mansfield Valley, Pa., Feb. 22, 1887—d. Washington, D.C., Feb. 1, 1952), received his B.A. degree from Dartmouth college, Hanover, N.H., in 1908 and his M.D. from Harvard in 1913. From 1940 to 1947 he was dean of the Yale university school of medicine and at the time of his death was civil director of U.S. army medical research. He was the author of many books and articles on epidemiology and conducted pioneer clinical tests on the sulfa drugs and penicillin.
- Blakeslee, Howard Walter**, U.S. journalist (b. New Dungeness, Wash., March 21, 1880—d. Port Washington, L.I., N.Y., May 2, 1952).
- Blanco, Juan Carlos**, Uruguayan diplomat (b. Montevideo, Urug., Dec. 6, 1879—d. Montevideo, May 3, 1952), was granted his law degree from the University of Montevideo. He entered public life as director of the port of Montevideo and was elected several times to the national legislature as a deputy. In 1919 he was the Uruguayan delegate plenipotentiary to the Versailles peace conference, and later chief delegate of his country to the League of Nations. He also served as minister of public works and minister of the interior and was twice foreign minister. In 1941 he was appointed first Uruguayan ambassador to the United States. His other ambassadorial posts included Argentina, Brazil and France. Blanco was the author of various works on ports and on legal subjects, and was a professor of literature and law at the University of Montevideo.
- Blenner, Carle (John)**, U.S. painter (b. Richmond, Va., Feb. 1, 1862—d. New Haven, Conn., April 12, 1952).
- Block, Leopold E.**, U.S. industrialist (b. Cincinnati, O., Jan. 13, 1869—d. Chicago, Ill., Nov. 11, 1952).
- Bloom, Benjamin**, U.S.-born banker and philanthropist (b. Healdsburg, Calif., Sept. 27, 1873—d. San Salvador, El Salvador, Jan. 1, 1952).
- Bonsels, Waldemar**, German novelist (b. Ahrensburg, Schleswig-Holstein, Feb. 21, 1881—d. Lake Starnberg near Munich, Ger., Aug. 17, 1952).
- Boole, Ella Alexander**, U.S. temperance leader (b. Van Wert, O., July 26, 1858—d. Brooklyn, N.Y., March 13, 1952), graduated from the College of Wooster, O., in 1878 and took her Ph.D. degree there in 1895. She taught school at Van Wert for five years before becoming actively engaged in the prohibition movement. From 1897 to 1903 she was president of a Woman's Christian Temperance union group in New York city; from 1909 to 1926 president of the W.C.T.U. state organization of New York; from 1925 to 1933 president of the national W.C.T.U.; and from 1931 to 1947 president of the World's W.C.T.U. She was also corresponding secretary for the woman's board of home missions of the Presbyterian Church in the U.S. from 1903 to 1909. Mrs. Boole was credited with being a powerful influence in securing adoption of the 18th amendment in 1919. She was an unsuccessful candidate for U.S. senator from New York on the Prohibition ticket in 1920.
- Bornstein, Joseph**, Polish-born writer and editor (b. Cracow, Pol., 1899?—d. New York, N.Y., June 25, 1952).
- Bosanquet, Sir Ronald (Samuel) Courthope**, British lawyer and author (b. Monmouthshire, Eng., Sept. 6, 1868—d. Monmouthshire, Nov. 5, 1952).
- Bosmans, Henriette**, Dutch pianist and composer (b. Amsterdam, Neth., Dec. 6, 1895—d. Amsterdam, Neth., July 37, 1952).
- Bourassa, Henri**, Canadian publisher and political leader (b. Montreal, Que., Sept. 1, 1868—d. Outremont, Que., Aug. 31, 1952).
- Bourbon y de la Torre, Francisco de Paula-Maria-Alfonso Jose de**, Spanish monarchist and army officer (b. Madrid, Sp., 1882—d. Madrid, Dec. 6, 1952).
- Bower, Alexander**, U.S. artist and art instructor (b. New York, N.Y., March 31, 1875—d. Wilmington, Del., Aug. 6, 1952).
- Breadner, Lloyd Samuel**, Canadian air chief marshal (b. Carleton Place, Ont., July 14, 1894—d. Boston, Mass., March 14, 1952), was educated at the Collegiate institute in Ottawa. During World War I he was an air squadron commander in Flanders, Belg., and won the distinguished service cross. On the formation of the royal Canadian air force in April 1924 he was commissioned and later became acting director (1928-32). Early in World War II he was appointed chief of the air staff and air vice-marshal in charge of general R.C.A.F. operations. He gave up this post in Nov. 1943 to go overseas as commander-in-chief of the R.C.A.F. in Great Britain. Shortly before his retirement in 1945 he was advanced to air chief marshal, the first to hold that rank in the R.C.A.F.
- Breisach, Paul**, Austrian-born conductor (b. Vienna, Aus., June 3, 1896—d. New York, N.Y., Dec. 26, 1952), studied at the state academy of music at Vienna and joined the Vienna Opera in 1918 as a conductor and assistant to the composer Richard Strauss. He later held important musical posts in Germany and was conductor of the Municipal Opera at Berlin until 1933, when the nazis discharged him. He went to the United States in 1939, becoming a U.S. citizen in 1945. From 1941 to 1946 he was conductor of the Metropolitan Opera in New York city, and from 1946 until his death conductor of the San Francisco, Calif., Opera. He was also conductor of the Cincinnati, O., Summer Opera and directed summer concerts at Grant park in Chicago, Ill.
- Brewer, Bessie Marsh** (MRS. SAM S. BREWER), Canadian-born etcher and painter (b. Toronto, Ont., June 1, 1883—d. New York, N.Y., April 29, 1952).
- Brickell, Henry Herschel**, U.S. literary critic (b. Senatobia, Miss., Sept. 13, 1889—d. Ridgefield, Conn., May 29, 1952), studied at the University of Mississippi, University, Miss., from 1906 to 1910. He was a reporter, copy-reader and editor for various newspapers between 1911 and 1923, book columnist for the *New York Evening Post* from 1923 to 1928 and literary

editor of that paper from 1934 to 1938. From 1928 to 1933 he had been general publications editor for Henry Holt & company, publishers. Meanwhile he wrote book reviews for the *New York Times*, *New York Herald Tribune* and *Saturday Review of Literature*, and in 1940 became editor of the annual volume of O. Henry memorial prize short stories. An authority on Latin American literature and history, Brickell was appointed senior cultural relations officer to the U.S. embassy at Bogotá, Col., in 1941 and assistant chief of the cultural co-operation division of the U.S. state department in 1944. Brickell was the author of several works on U.S. and Latin American literature. His death at his Connecticut home was termed a suicide.

Briggs, Sir Harold Rawdon, British statesman and army officer (b. Yorkshire, Eng., July 14, 1894—d. Nicosia, Cyprus, Oct. 27, 1952).

Briggs, Walter Owen, U.S. industrialist (b. Ypsilanti, Mich., Feb. 27, 1877—d. Miami Beach, Fla., Jan. 17, 1952).

Briggs, William Harlowe, U.S. author and editor (b. Kalamazoo, Mich., July 22, 1876—d. New York, N.Y., July 31, 1952).

Brink, Francis G., U.S. army officer (b. Marathon, N.Y., Aug. 22, 1893—d. Washington, D.C., June 24, 1952).

Broadbridge, George Thomas Broadbridge, 1ST BARON, British politician and former lord mayor of London (b. Brighton, Sussex, Eng., Feb. 13, 1869—d. Cornwall, Eng., April 16, 1952).

Broadhurst, George, U.S. playwright (b. Walsall, Eng., June 3, 1866—d. Santa Barbara, Calif., Jan. 31, 1952).

Brown, Margaret Wise, U.S. author of children's books (b. New York, N.Y., May 23, 1910—d. Nice, Fr., Nov. 13, 1952), studied as a young girl at Lausanne, Switz., and received her B.A. degree from Hollins (Va.) college in 1932. Later she was a member of the studies and publications department of the Bureau of Educational Experiments (the "Bank Street school") in New York city. Under three pen names—Golden MacDonald, Timothy Hay and Juniper Sage—as well as under her own, she wrote more than 60 children's books. Miss Brown also was the author of a number of songs recorded for children.

Brush, Katharine, U.S. author (b. Middletown, Conn., Aug. 15, 1902—d. New York, N.Y., June 10, 1952), was educated at Centenary Collegiate institute in Hackettstown, N.J., and was a motion-picture columnist for the *Boston Traveler* from 1918 to 1920. In 1923 she began writing fiction, including two novels and a volume of short stories, but attracted little attention until her *Young Man of Manhattan* appeared in 1930. This novel about a young New York sports reporter was a best seller, as was *Red-Headed Woman*, published the following year. None of her later work, including *Don't Ever Leave Me* (1935), *This Is on Me* (1940), *The Boy From Maine* (1942), *Out of My Mind* (1943) and *This Man and This Woman* (1944) enjoyed comparable popularity.

Bryson, Gladys Eugenia, U.S. sociologist, educator and author (b. Carlisle, Ky., April 2, 1894—d. Northampton, Mass., Dec. 18, 1952).

Bull, Jerome Case, U.S. businessman (b. Racine, Wis.—d. New York, N.Y., Nov. 16, 1952).

Bulliet, Clarence Joseph, U.S. art critic and author (b. Corydon, Ind., March 16, 1883—d. Chicago, Ill., Oct. 20, 1952), received his bachelor's degree from Indiana university, Bloomington, in 1905 and in the same year joined the staff of the *Louisville* (Ky.) *Herald*. Subsequently he worked on several other papers until 1932, when he was appointed art critic of the *Chicago Daily News*; he was also motion-picture critic of that paper from 1939 to 1942 and music critic from 1941 to 1948. He was one of the ten U.S. founding members of the International Association of Art Critics at Paris, Fr., in 1948. Among his published works were *Apples and Madonnas* (1927), *Venus Castina* (1928), *The Significant Moderns and Their Pictures* (1936), *Masterpieces of Italian Art* (1939), *Eccentrics in Modern Art* (1947), *The Eccentrics* (1951) and *Art Treasures From Vienna* (1952).

Burnside, R. H., British author and producer (b. Glasgow, Scot., Sept. 7, 1870—d. Metuchen, N.J., Sept. 14, 1952).

Burton, Jean, Canadian-U.S. author and editor (b. Abernethy, Sask., 1905—d. Berkeley, Calif., Jan. 18, 1952).

Busbey, Leroy White, Jr., U.S. naval officer (b. Washington, D.C., March 7, 1897—d. San Francisco, Calif., Feb. 27, 1952).

Busch, Adolf Georg Wilhelm, German-born violinist and composer (b. Siegen, Ger., Aug. 8, 1891—d. Guilford, Vt., June 9, 1952), was the son of a musician and violinmaker. Beginning his study of music at the age of 4, he made his debut as a concert violinist while still in his teens, after having studied violin and composition at Cologne and Bonn. From 1912 to 1918 he played first violin for the Vienna orchestra in Austria. He also founded the famous Busch String quartet and later the Busch Chamber Music players. He left Germany after Adolf Hitler became chancellor and never returned, continuing his concert tours throughout the rest of Europe and in the near east, and making his home for a while in Basle, Switz. In 1939 he moved to the United States, where he became a naturalized citizen. He appeared often on the concert stage with his son-in-law Rudolf Serkin, pianist, and his brother Hermann Busch, cellist, and was also a frequent soloist with orchestras conducted by another brother, Fritz Busch (1890-1951).

Busch's compositions included piano and violin sonatas, songs, *études* for orchestra, and symphonies.

Butler, John Washington, U.S. educator (b. 1876?—d. Lafayette, Tenn., Sept. 24, 1952).

Butler, Sir Montagu Sherard Dawes, British statesman (b. May 19, 1873—d. Cambridge, Eng., Nov. 7, 1952).

Byrne, Eugene Hugh, U.S. educator (b. Baraboo, Wis., Nov. 16, 1882—d. Princeton, N.J., Sept. 23, 1952).

Byrne, Patrick J., U.S.-born Roman Catholic bishop and missionary (b. Washington, D.C.—missing in Korea and declared officially dead by the Vatican Oct. 29, 1952).

Cadbury, Henry Tylor, British newspaper director (b. Woodbrooke, Eng., Oct. 10, 1882—d. London, Eng., Sept. 25, 1952).

Cade, Svend, Danish theatre and movie director (b. 1876?—d. Aarhus, Den., June 25, 1952).

Cairns, Sir Hugh William Bell, British surgeon (b. Port Pirie, Austr., June 26, 1896—d. Oxford, Eng., July 18, 1952), was educated at Adelaide High school and Adelaide university. He qualified in medicine in 1917 while serving in the Australian army, and was a Rhodes scholar at Balliol college, Oxford university, 1919-20, becoming a fellow in 1937. He was Hunterian professor at the Royal College of Surgeons, 1925, and a Rockefeller travelling fellow in the United States, 1926-27, when he became a pupil of Harvey Cushing and became interested in neurosurgery. He was honorary surgeon to the London Hospital for Paralysis and Epilepsy, 1931-34, and to the National Hospital for Diseases of the Nervous System, 1934-37. When Lord Nuffield decided to endow the Oxford medical school, Cairns helped to work out the lines of development which it should follow and in 1937 he became Nuffield professor of surgery. During 1942-50 he was a member of the council of the Royal College of Surgeons. He was knighted in 1946.

Carter, Rupert Franklin, U.S. surgeon (b. Holly Springs, N.C., 1894—d. New York, N.Y., April 19, 1952).

Castelnuovo, Guido, Italian mathematician and senator (b. Venice, It., Aug. 14, 1865—d. Rome, It., April 27, 1952).

Chambrun, Count Charles de, French diplomat (b. Washington, D.C., Feb. 10, 1875—d. Paris, Fr., Nov. 6, 1952).

Champion de Crespigny, Sir (Constantine) Trent, Australian physician (b. Queenscliff, Victoria, Austr., March 5, 1882—d. Adelaide, Austr., Oct. 27, 1952).

Chase, George Henry, U.S. archaeologist and educator (b. Lynn, Mass., June 13, 1874—d. Cambridge, Mass., Feb. 2, 1952), was educated at Harvard university, where he received his doctorate in 1900, and at the American School of Classical Studies in Athens, Gr. Beginning as an instructor in Greek and Latin at Harvard in 1901, he was later assistant professor and professor of archaeology (1906-45), dean of the graduate school of arts and sciences (1925-39), dean of the university (1939-45) and acting president of the university during the World War II period while James B. Conant was absent on government work. He was the author of several books and papers on classical sculpture and philology.

Chernov, Victor: see Tchernov.

Choibalsan, Khorloghiyin, Mongolian politician and army officer (b. Feb. 8, 1895—d. Moscow, U.S.S.R., Jan. 26, 1952).

Christy, Howard Chandler, U.S. artist (b. Morgan county, O., Jan. 10, 1873—d. New York, N.Y., March 3, 1952), attended school at Duncan Falls, O., and went to New York city in 1893 to study art. He decided early to become an illustrator and accompanied the 2nd U.S. regulars to Cuba during the Spanish-American War on journalistic assignments. His illustrations of Theodore Roosevelt's "Rough Riders," published in *Leslie's*, *Harper's*, *Scribner's* and other magazines, made him a national figure. His World War I posters, "Fight or Buy Bonds!" and "Americans All," were familiar to millions. In 1920 Christy gave up illustration for portrait painting. Among his scores of famous subjects were Warren G. Harding, Calvin Coolidge, Herbert C. Hoover, Charles E. Hughes, Will Rogers, Fritz Kreisler, Mary Baker Eddy and Francis Cardinal Spellman. His large painting, "Signing of the Constitution," was hung in the national capitol at Washington, D.C., and one of the signing of the United Nations charter in the state capitol building at Columbus, O. He also illustrated three books by James Whitcomb Riley.

Most of Christy's illustrations between 1910 and 1920 were done for Hearst magazines. During this period he created the famous "Christy Girl."

Clark, Sheldon, U.S. business executive (b. Chicago, Ill., Aug. 29, 1876—d. Chicago, Aug. 15, 1952).

Clark, William Clifford, Canadian bank official (b. Martintown, Ont., April 18, 1889—d. Chicago, Ill., Dec. 27, 1952).

Clement, Mrs. Emma Clarissa, U.S. civic worker, named "American Mother of the Year" in 1946, the only Negro so honoured (d. Louisville, Ky., Dec. 26, 1952).

Clementis, Vladimir, Czechoslovak politician (b. Tisovec, Slovakia, Sept. 20, 1902—d. Prague, Czechoslovakia, Dec. 3, 1952), was a Communist organizer in Slovakia during the 1930s and in 1935-38 was a Communist deputy in the Czechoslovak parliament. In 1939-40 he was in exile in France and from 1940 to 1944 he was a member of the legal council of the Czechoslovak government in exile in London. He returned to Czechoslovakia in 1945 and was undersecretary of state for foreign affairs from then until 1948 when he became foreign minister. While serving as a delegate to the United Nations general assembly, New York city, 1949, he was told of reports that he would be arrested on his return to Czechoslovakia. In March 1950 he was relieved of his post of foreign minister and in Feb. 1951 he was formally expelled from

the party and arrested. In Nov. 1952 Clementis, with ten others, including Rudolf Slansky, was sentenced to death by a People's court in Prague for being concerned in an alleged Jewish plot to overthrow communism in Czechoslovakia. He was hanged on Dec. 3.

Cobb, John Rhodes, British racing motorist (b. Esher, Surrey, Eng., Dec. 2, 1899—d. Loch Ness, Scot., Sept. 29, 1952), was educated at Eton and at Trinity hall, Cambridge. In private life a businessman, he devoted his spare time to motor racing, becoming well-known at Brooklands where, in 1932-39, he broke all the world's records for time and distance up to 24 hr., and where he was holder of the lap record of 143.4 m.p.h. In 1938 he first broke the world's land speed record at Bonneville salt flats, Utah, in a Raiton car, with a mean speed of 350.20 m.p.h.; this was beaten by Captain George Eyston a day later, but in 1939 Cobb again broke the record with a speed of 369.7 m.p.h. After World War II, in which he served in the royal air force and in the air transport auxiliary, he returned to Utah and, on Sept. 16, 1947, broke his own record with a mean speed of 394.2 m.p.h., having travelled at more than 403 m.p.h. in the process. He was killed while making an attempt on the world's water speed record in his jet-propelled boat "Crusader".

Coburn, Richard (FRANK D. DE LONG), U.S. song writer (b. Ipswich, Mass., June 8, 1886—d. Los Angeles, Calif., Oct. 27, 1952).

Collins, Seward Bishop, U.S. publisher and editor (b. Syracuse, N.Y., April 22, 1899—d. Laconia, N.H., Dec. 8, 1952).

Conklin, Edwin Grant, U.S. biologist (b. Waldo, O., Nov. 24, 1863—d. Princeton, N.J., Nov. 20, 1952), was an international authority on genetics and heredity. For his career prior to his retirement from the faculty of Princeton university in 1933, see *Encyclopaedia Britannica*. He continued active research after his retirement, writing 3 books and almost 100 scientific articles to add to the total of approximately 175 works written before 1933. In his later years he devoted much study to the effects of scientific advance upon civilization, pointing out that social and political progress had been far out-distanced by progress of the physical sciences.

Cook, Arthur Bernard, British classical archaeologist (b. Oct. 22, 1868—d. Cambridge, Eng., April 26, 1952).

Copeland, Charles Townsend, U.S. educator and editor (b. Calais, Me., April 27, 1860—d. Waverley, Mass., July 24, 1952).

Coupland, Sir Reginald, British historian and author (b. Aug. 2, 1884—d. Southampton, Eng., Nov. 6, 1952).

Cox, Edward Eugene, U.S. legislator (b. near Camilla, Ga., April 3, 1880—d. Bethesda, Md., Dec. 24, 1952), took his law degree at Mercer university, Macon, Ga., in 1902 and set up legal practice in Camilla. From 1912 to 1916 he was a judge of the superior court of the Albany, Ga., circuit. He was elected to the U.S. house of representatives as a Democrat from the 2nd Georgia district in 1924 and served consecutively in the 69th-82nd congresses (1925-53); in Nov. 1952 he was re-elected to the 83rd congress. Among southern Democrats he was one of the most vocal and most colourful opponents of the administrations of Franklin D. Roosevelt and Harry S. Truman.

Coyle, Kathleen, Irish-U.S. novelist (b. Ireland, 1885?—d. Philadelphia, Pa., March 25, 1952), lived in Paris for a number of years before making her home in the United States at the beginning of World War I. Her best-known novel was *Lio* (1929).

Cripps, Sir (Richard) Stafford, British government official and lawyer (b. London, Eng., April 24, 1889—d. Zurich, Switz., April 21, 1952), was educated at Winchester and at University college, London. He was called to the bar in 1913, and in 1914, being medically unfit for the army, he went to France as a Red Cross driver, returning in 1915 to become assistant superintendent of a munitions factory. He later returned to the bar and in 1927 became a king's counsel. He joined the Labour party in 1929 and was knighted and made solicitor general in 1930, being elected Labour member of parliament for East Bristol in 1931. When Ramsay MacDonald formed his national government in 1931, Cripps refused to serve in it. An opponent of "gradualism" and on the extreme left of the Labour party, he helped to found the Socialist league in 1932. Nevertheless, he was elected to the national executive council of the Labour party in 1934, only to have to resign from it within a year over his opposition to its support for League of Nations sanctions against Italy. In March 1937 the Labour party executive declared membership of the Socialist league to be incompatible with membership of the Labour party and the former was dissolved. The threat from nazi Germany in 1938 changed Cripps's views on foreign policy and he began his advocacy of a popular front. He refused to withdraw his campaign and was expelled from the Labour party in 1939. On May 20, 1940, Winston Churchill appointed him ambassador to Moscow where he concluded the Anglo-Soviet pact. On his return he was appointed lord privy seal, leader of the house of commons and a member of the war cabinet in Feb. 1942. In the same year he was sent to India in an unsuccessful attempt to work out that country's independence. In Nov. 1942 he was appointed minister of aircraft

production, remaining in this post until his appointment as president of the London Board of Trade in July 1945 (he had been readmitted to the Labour party in the same year). He went to India again in 1946 to seek a peaceful solution to India's problems but the hostility between the Congress party and the Moslem league proved insurmountable. Cripps's frank statements of the facts during the economic crisis of 1947 first earned him the epithet of "austerity" and in September he became minister for economic affairs. A few weeks later Hugh Dalton resigned and Cripps succeeded him as chancellor of the exchequer. The essentials of his policy were a concentration on exports, a carefully worked-out system of priorities in the distribution of raw materials designed to bring this about and a strict fiscal policy aimed at checking inflation. Ill health compelled him to resign from office and retire from public life on Oct. 20, 1950.

Croce, Benedetto, Italian philosopher, historian and statesman (b. Pescasseroli, Aquila, It., Feb. 25, 1866—d. Naples, It., Nov. 20, 1952), was educated at a Naples school and at Rome university. For an account of his work and his philosophy, see *Encyclopaedia Britannica*.

Croce's philosophy, which developed under the influence of Hegelianism, was grounded in an idealistic metaphysics that conceived reality in terms of idea, mind and history. Much of his writing was devoted to history, the philosophy of history and aesthetics. In keeping with the spirit of his philosophy, Croce was a man of sincere commitment to social and political ideals and action. Having become the leader of the opposition to Italian fascism during the later years of the Mussolini regime, he played a leading role, following World War II, as political philosopher and elder statesman in the establishment of democracy in Italy.

Crosby, Dixie Lee (WILMA W. WYATT), U.S. actress (b. Harriman, Tenn., Nov. 4, 1911—d. Hollywood, Calif., Nov. 1, 1952), entered motion pictures in 1928 and soon rose to stardom as a singer and dancer; she was also starred in several Broadway plays. She retired from screen and stage after her marriage in 1930 to the singer Bing Crosby.

Crowell, Benedict, U.S. business executive and army officer (b. Cleveland, O., Oct. 21, 1869—d. Cleveland, Sept. 8, 1952).

Cuddihy, Robert Joseph, U.S. publisher (b. New York, N.Y., Dec. 31, 1862—d. New York, Dec. 22, 1952).

Curtis, James Freeman, U.S. attorney (b. Manchester, Mass., Aug. 16, 1878—d. Miami, Fla., Nov. 24, 1952).

Dakin, Henry Drysdale, British-born research chemist (b. London, Eng., March 12, 1880—d. Scarborough-on-Hudson, N.Y., Feb. 10, 1952).

Dampier, Sir William Cecil, British scientist and author (b. London, Eng., Dec. 27, 1867—d. London, Dec. 11, 1952).

Daniel, Lewis C., U.S. etcher and painter (b. New York, N.Y., Oct. 23, 1901—d. near Brookville, Ill., July 18, 1952).

Dasso, David, Peruvian engineer and statesman (b. Lima, Peru, Feb. 25, 1896—d. Lima, May 18, 1952).

Davidson, Jo, U.S. sculptor (b. New York, N.Y., March 30, 1883—d. Tours, Fr., Jan. 2, 1952), studied at the Art Students league of New York city and at the Ecole des Beaux Arts in Paris. In 1907 he made Paris his permanent home, remaining there except for periodic trips to the United States and other countries until the beginning of World War II. He then returned to the United States, living in a farmhouse in Bucks county, Pa., and working in a studio in New York city. He had just returned to France from a trip to Israel, where he did casts for busts of Chaim Weizmann and David Ben-Gurion, when he died at Tours.

Davidson was popularly known as the "dean of American sculptors" and as the man who did more busts of great men and women than any other sculptor of his time. At the Paris peace conference in 1919 he modelled portrait busts of leading statesmen and military figures who met there. That of Woodrow Wilson was placed in the Luxembourg museum in Paris; others of the conference figures were placed in the Musée des Invalides. Among the numerous other portrait busts or statues of famous personages modelled by Davidson are those of Franklin D. Roosevelt, Mme. Chiang Kai-shek, Anatole France, John D. Rockefeller, Robert M. La Follette, Andrew W. Mellon, Walt Whitman, George Bernard Shaw, James Joyce, Will Rogers, H. G. Wells, Sir James Barrie, Sir Rabindranath Tagore, Mohandas Gandhi, Charles de Gaulle, Helen Keller, and various presidents of South American republics.

Davis, Harvey Nathaniel, U.S. educator and scientist (b. Providence, R.I., June 6, 1881—d. New York, N.Y., Dec. 3, 1952).

Dawes, Henry May, U.S. business executive (b. Marietta, O., April 22, 1877—d. Evanston, Ill., Sept. 29, 1952), graduated from Marietta (O.) college in 1896. He rose to become president of the Pure Oil company in 1924 and chairman of the executive committee of that company in 1947.

Deakin, Ralph, British newspaperman and author (b. Lincoln, Eng., Nov. 4, 1888—d. London, Eng., Dec. 19, 1952).

1952 OBITUARIES: John Dewey, U.S. educator and philosopher; George VI, king of England; Knut Hamsun, Norwegian novelist; Harold L. Ickes, former U.S. government official; Sister Elizabeth Kenny, Australian nurse

- Denain, Albert**, French army officer and former minister for air (b. Dax, Landes, Fr., Nov. 6, 1880—d. Nice, Fr., Dec. 31, 1952).
- de Pass, Alfred Aaron**, South African philanthropist and art collector (b. Capetown, U. of S. Af., 1861—d. Capetown, Dec. 9, 1952).
- Derry, John**, British aviator (b. Cairo, Egy., Dec. 5, 1921—d. Farnborough, Hampshire, Eng., Sept. 6, 1952).
- Dessar, Louis Paul**, U.S. painter (b. Indianapolis, Ind., Jan. 22, 1867—d. Preston, Conn., Feb. 14, 1952).
- Dewey, John**, U.S. educator and philosopher (b. Burlington, Vt., Oct. 20, 1859—d. New York, N.Y., June 1, 1952), took his B.A. degree in 1879 from the University of Vermont, Burlington, Vt., and his Ph.D. from The Johns Hopkins university, Baltimore, Md., in 1884. For his career and the main points of his philosophy, see his biography in *Encyclopedia Britannica*. His pragmatic philosophy, inspired by the scientific spirit and a profoundly democratic conscience and developed within a context defined by evolutionary biology and social psychology, had been a major determinant of the naturalistic and humanistic course of recent thought. Primarily a moral philosopher devoted to the achievement of the good society through human intelligence, Dewey made significant contributions to ethical theory, empirical methodology, logic, the theory of knowledge, psychology, the theory of language and meaning, the concept of truth, political theory, the philosophy of education and the philosophy of religion. He vigorously opposed supernaturalism, absolutistic metaphysics and ethics, the separation of thought from action, fact from value and science from morals. Long before his death, Dewey had become a symbol of liberalism in philosophic thought, education and social action.
- Dickinson, John**, U.S. attorney (b. Greensboro, Md., Feb. 24, 1894—d. Baltimore, Md., April 9, 1952).
- Dietrich, Otto**, German politician and journalist (b. Essen, Ger., 1897?—d. Duesseldorf, Ger., Nov. 22, 1952).
- Dodd, Monroe Elmon**, U.S. Baptist clergyman and author (b. Brazil, Tenn., Sept. 8, 1878—d. Shreveport, La., Aug. 6, 1952).
- Dolman, John, Jr.**, U.S. author and teacher (b. Philadelphia, Pa., May 21, 1888—d. Swarthmore, Pa., July 9, 1952).
- Donnedieu de Vabres, Henri**, French criminologist, jurist and educator (b. Nîmes, Fr., July 8, 1880—d. Paris, Fr., Feb. 15, 1952).
- Douglas, Norman** (GEORGE NORMAN DOUGLASS), British novelist and essayist (b. Tilquhillie, Kincardineshire, Scot., Dec. 8, 1868—d. Capri, It., Feb. 9, 1952), was educated at Uppingham school and at Karlsruhe, Ger. His main interests were scientific and he wrote various papers on zoology. He served in the diplomatic corps at St. Petersburg, U.S.S.R., from 1894 to 1896, when he left the service and went to Italy. Eventually he settled on Capri. An unsuccessful collection of short stories, *Unprofessional Tales* (1901) was followed by *Siren Land* (1911), about the Sorrento peninsula, and *Old Calabria* (1915). Douglas established his literary reputation in 1917 with the celebrated novel *South Wind*, whose wit and irony called forth comparisons with Peacock and Wilde. His later books include *They Went* (1921); *Alone* (1921), which he later described as his favourite; *Together* (1923); *Birds and Beasts of the Greek Anthology* (1929); and two autobiographical works, *Looking Back* (1933) and *Late Harvest* (1946). Douglas was a lively, erudite writer and a hedonist and sceptic.
- Dreier, Katherine S.**, U.S. artist (b. Brooklyn, N.Y., Sept. 10, 1877—d. Milford, Conn., March 29, 1952), was a leader in the U.S. Abstractionist school of art, associated with the French painter Marcel Duchamp in the organization known as *Société Anonyme* in New York city.
- Duffy, Charles G.**, U.S. newspaperman and public information officer for the North Atlantic Treaty forces (b. Boston, Mass., 1899?—d. Naples, It., Dec. 10, 1952).
- Dugdale, Thomas Cantrell**, British artist (b. Blackburn, Eng., June 2, 1880—d. London, Eng., Nov. 13, 1952).
- Duncan, Sir Andrew Rae**, British politician and industrialist (b. Irvine, Ayrshire, Scot., June 3, 1884—d. London, Eng., March 30, 1952).
- Dunraven and Mount-Earl, Windham Henry Wyndham-Quin, 5TH EARL**, British author (b. Feb. 7, 1857—d. County Limerick, Ire., Oct. 23, 1952).
- Du Pont, Lammot**, U.S. industrialist (b. Wilmington, Del., Oct. 12, 1880—d. New London, Conn., July 24, 1952).
- Eames, Emma**, U.S. operatic soprano (b. Shanghai, China, Aug. 13, 1867—d. New York, N.Y., June 13, 1952).
- Egan, Raymond Blanning**, Canadian-U.S. songwriter (b. Windsor, Ont., Nov. 14, 1890—d. Westport, Conn., Oct. 13, 1952), attended the University of Michigan, Ann Arbor. He composed a number of hit songs, including "Till We Meet Again," "Japanese Sandman," "Sleepy Time Gal" and "Ain't We Got Fun," and wrote the lyrics for a number of musical shows produced in the United States.
- Einstein, Alfred**, German-U.S. musicologist (b. Munich, Ger., Dec. 30, 1880—d. El Cerrito, Calif., Feb. 13, 1952).
- Elena**, former queen of Italy (b. Cetinje, Montenegro, Jan. 8, 1873—d. near Montpellier, Fr., Nov. 28, 1952). was born Princess Elena Petrovich Niegosh, daughter of Nicholas I, king of Montenegro. She married the prince of Naples in Rome in Oct. 1896 and became queen of Italy in 1900 when her husband succeeded to the throne as King Victor Emmanuel III. Her beauty, modesty and charitable work won the people's affection. Soon after her husband's death in 1947 Queen Elena went to live in retirement in southern France.
- Elsaesser, Armin E.**, U.S. surgeon (b. Switzerland, 1875—d. Youngstown, O., Oct. 29, 1952).
- Eluard, Paul** (EUGÈNE GRINDEL), French poet, novelist and essayist (b. St. Denis, Fr., Dec. 14, 1895—d. St. Denis, Nov. 18, 1952).
- Eve, Frank Cecil**, British physician (b. Silsoe, Bedfordshire, Eng., Feb. 15, 1871—d. England, Dec. 7, 1952).
- Farnol, John Jeffery**, British novelist (b. Birmingham, Eng., Feb. 10, 1878—d. Eastbourne, Sussex, Eng., Aug. 9, 1952).
- Farwell, Arthur**, U.S. composer (b. St. Paul, Minn., April 23, 1872—d. New York, N.Y., Jan. 20, 1952).
- Faulhaber, Michael Cardinal von**, German Roman Catholic ecclesiastic (b. Heidenfeld, Lower Franconia, Ger., March 5, 1869—d. Munich, Ger., June 12, 1952), was ordained in 1892. He became professor of Old Testament exegesis at Strasbourg university, Alsace, Fr., in 1903. In 1910 he was consecrated bishop of Speyer. He became archbishop of Munich in 1917 and was elevated to the Sacred college in 1921. In 1933 he preached a series of sermons attacking Hitler's persecution of the Jews, and in 1934, during the oppression of the Evangelical Church, he arranged for the use of Roman Catholic funds to aid dispossessed Bavarian pastors. After the breakdown of the nazi regime Faulhaber was an important unofficial adviser to the Allies. In Jan. 1951 Theodor Heuss, the west Federal German president, conferred upon him the Grand Cross of the Order of Service.
- Feller, Abraham Howard**, U.S. official of the United Nations (b. New York, N.Y., Dec. 24, 1904—d. New York, Nov. 13, 1952), took his bachelor's degree at Columbia university in 1925 and his law degree from Harvard in 1928; he then studied for a year at the University of Berlin, Ger. From 1931 to 1934 he taught at Harvard law school, then was appointed special assistant to the U.S. attorney general, holding this post until his appointment as associate professor of law at Yale university in 1940. During World War II Feller acted as special consultant or counsel to several executive emergency agencies of the federal government. He was a delegate to the United Nations organization conference at San Francisco, Calif., in 1945, and the following year he was appointed general counsel of the U.N. by Trygve Lie, the secretary-general. Feller leaped to his death from his New York city apartment during the height of U.S. investigations into alleged subversive activities of United States citizens employed by the U.N. Lie attributed the suicide to tension and overwork resulting from Feller's defense of U.N. employees against "indiscriminate smears and exaggerated charges."
- Flanagan, John**, U.S. sculptor (b. Newark, N.J., 1865?—d. New York, N.Y., March 28, 1952).
- Fogo, James Gordon**, Canadian political leader and attorney (b. Halifax, N.S., July 9, 1896—d. Murray Bay, Que., July 6, 1952), was educated at Dalhousie university, Halifax, and served overseas with the Canadian expeditionary forces in World War I. Admitted to the Nova Scotia bar in 1924, he became king's counsel in 1938, meanwhile practising law at Halifax. After serving on many government boards he was appointed to the Canadian senate in 1949. From his early years he had been closely associated with the affairs of the Canadian Liberal party, and in 1946 he became president of the National Liberal federation.
- Ford, Francis X.**, U.S.-born Roman Catholic bishop and missionary (b. Brooklyn, N.Y., Jan. 11, 1892—d. Canton, China, Feb. 21, 1952), was a graduate of the Maryknoll Catholic Foreign Missionary Society of America (near Ossining, N.Y.) and was ordained priest in 1917. The following year he went to China as a missionary. Consecrated first bishop of Meihsein in Kwangtung province in 1935, he remained in China until the end of World War II. After a brief visit in the United States he returned to China where, following the Communist defeat of the nationalist forces, he was placed under arrest in Dec. 1950. His death in a Communist prison hospital at Canton was reported from Hong Kong on Sept. 2, 1952, by a nun, his former secretary, who had been arrested at the same time but later released.
- Ford, Horatio**, U.S. attorney and civic leader (b. Cleveland, O., June 23, 1881—d. near Litchfield, Conn., Nov. 28, 1952).
- Fortescue, Granville (Roland)**, U.S. author (b. New York, N.Y., Oct. 12, 1875—d. West Palm Beach, Fla., April 21, 1952).
- Fox, William**, U.S. motion picture producer (b. Tulchva, Hung., Jan. 1, 1879—d. New York, N.Y., May 8, 1952), was brought by his parents to the United States as a boy and received little formal education. In his early 20s he operated a nickelodeon in New York city and soon founded an exhibition company and a chain of motion picture theatres. Turning to production, he set up a pioneer studio at Fort Lee, N.J., and in 1915 founded the Fox Film corporation, which later grew into a \$300,000,000 enterprise before its collapse in 1930. Fox was involved in protracted bankruptcy litigation during the depression years of the 1930s, and in 1935 the firm he founded was merged with 20th Century Pictures to form 20th Century-Fox. Two of Fox's best-known motion pictures were *What Price Glory* and *Seventh Heaven*.
- Frankau, Gilbert**, British author and journalist (b. April 21, 1884—d. Hove, Sussex, Eng., Nov. 4, 1952).
- Furse, Dame Katharine**, British founder of WRENS (b. Bristol, Eng., Nov. 23, 1875—d. London, Eng., Nov. 25, 1952).
- Gabriel, Gilbert Wolf**, U.S. author and drama critic (b. Brooklyn, N.Y., Jan. 18, 1890—d. Mount Kisco, N.Y., Sept. 3, 1952).

Gallatin, Albert Eugene, U.S. painter, author and art collector (b. Villanova, Pa., July 23, 1881—d. New York, N.Y., June 15, 1952).

Garfield, John (JULIUS GARFINKLE), U.S. actor (b. New York, N.Y., March 4, 1913—d. New York, May 21, 1952), attended the public schools of New York city and, under the tutelage of the child guidance specialist, Angelo Patri, studied dramatics. After playing minor roles with Eva Le Gallienne's Civic Repertory company he joined the Group Theatre Acting company. Later he starred in Arthur Kober's *Having a Wonderful Time*, but feeling under obligation to the Group Theatre, returned there to appear in such plays as *Golden Boy*, *Waiting for Lefty* and *Weep for the Virgins*. In 1938 he made his first appearance in motion pictures in *Four Daughters*. The picture was a success, and Garfield was cast thereafter as a gangster or tough—roles for which the public perhaps knew him best. Among his pictures were *Juarez*, *Saturday's Children*, *The Sea Wolf*, *Tortilla Flat*, *Between Two Worlds*, *Destination Tokyo*, *Humoresque*, *Force of Evil*, *Gentleman's Agreement* and *Body and Soul*. Garfield returned frequently to Broadway and had starred in a revival of *Golden Boy* just prior to his death. In 1951 Garfield was asked to testify before the house committee on un-American activities about alleged association with Communist-front organizations; he denied that he was either a Communist or fellow traveller.

Gaylord, Clifford W., U.S. business executive (b. Lockport, Ill., Oct. 10, 1883—d. St. Louis, Mo., Jan. 7, 1952).

George VI (ALBERT FREDERICK ARTHUR GEORGE), king of Great Britain, Ireland and the British dominions (b. York cottage, Sandringham, Norfolk, Eng., Dec. 14, 1895—d. Sandringham, Feb. 6, 1952), reigned over Great Britain from 1936 until his death (for details of his career, see *Encyclopædia Britannica*). He became king upon the abdication of his elder brother, King Edward VIII, in Dec. 1936, and was crowned in Westminster abbey the following May 12. Highlights of his reign included a visit to the United States in 1939 (the first such visit of a reigning English sovereign), his visits throughout Great Britain and to the North African front during World War II, his morale-building addresses during that war and his state visit to the Union of South Africa in 1947. He had planned to make a similar tour of Australia but was prevented from doing so by illness in 1948. His recovery was slow, but by 1951 he seemed to have regained health, sufficiently so at least to have made a number of public appearances. In the summer of 1951, however, he was again overtaken by illness and underwent an operation on one of his lungs in Buckingham palace on Sept. 23. Again his recovery seemed steady, and he made his customary Christmas day broadcast to the nation. His last appearance in public was on Jan. 31, 1952, when he went to the airport to say good-bye to Princess Elizabeth and the duke of Edinburgh at the start of their projected visit to Australia and New Zealand. He died at Sandringham in his sleep early in the morning of Feb. 6, 1952. The new queen, then at Kenya in Africa on the first part of her tour, returned immediately to London with her husband and was proclaimed Elizabeth II in succession to her father. After private rites at Sandringham, the king lay in state in Westminster hall, London, where 300,000 persons went Feb. 12–14 to pay their last respects. He was buried Feb. 15 in St. George's chapel, Windsor castle.

Gerber, Frank, U.S. industrialist (b. Fremont, Mich., May 6, 1898—d. Fremont, Oct. 7, 1952).

Gerhauser, William Henry, U.S. industrialist (b. Detroit, Mich., Jan. 7, 1889—d. Cleveland, O., Nov. 23, 1952).

Giannini, Lawrence Mario, U.S. banker (b. San Francisco, Calif., Nov. 25, 1894—d. San Francisco, Aug. 19, 1952), was the son of Amadeo Peter Giannini (1870–1949), founder of the huge California banking empire which was consolidated into the Bank of America National Trust and Savings association in 1930. Lawrence M. Giannini took his law degree from the University of California in 1920 and was admitted to the bar, but later decided to follow in his father's footsteps as a banker. In 1932 he was appointed senior vice-president of Bank of America and in 1936 president and chairman of the executive committee. At the time of his death, Bank of America with its numerous branches in California was the world's largest private commercial bank.

Gibbon, John Murray, Canadian author (b. Udewelle, Ceylon, April 12, 1875—d. Montreal, Que., July 2, 1952).

Globus, Joseph H., Russian-born U.S. neurologist (b. Vitebsk, Russia, Nov. 25, 1885—d. New York, N.Y., Nov. 20, 1952).

González, Martínez Enrique, Mexican government official and poet (b. Guadalupe, Mex., April 13, 1871—d. Mexico City, Mex., Feb. 19, 1952).

Gooch, Tom Carbry, U.S. editor and publisher (b. Bonham, Tex., Jan. 25, 1880—d. Dallas, Tex., June 13, 1952).

Goschen, Sir George Joachim, British diplomat (b. London, Eng., Oct. 15, 1866—d. Hawkhurst, Kent, Eng., July 24, 1952).

Gottlieb, Moritz Melvin, U.S. manufacturer and philanthropist (b. Washington, D.C., July 19, 1893—d. Boston, Mass., Nov. 23, 1952).

Gould, Edwin Miner Lawrence, U.S. Swedenborgian clergyman, lecturer and writer (b. Montreal, Que., May 4, 1886—d. New York, N.Y., Dec. 26, 1952).

Gow, James, U.S. playwright and motion-picture scenarist (b. Creston, Ia., Aug. 23, 1907—d. New York, N.Y., Feb. 11, 1952), graduated from the University of Colorado at Boulder and from 1928 to 1931 was a drama and film critic for the *New York World*. With Arnaud d'Usseau he wrote *Tomorrow the World* (1943) and *Deep Are the Roots* (1945), both outstanding successes on Broadway. Gow also collaborated on several motion pictures, including *One Night of Love* with Edmund North and *Repent at Leisure* with D'Usseau.

Green, William, U.S. labour leader (b. Coshocton, O., March 3, 1873—d. Coshocton, Nov. 21, 1952), led the American Federation of Labor as its president for almost 28 years (for his early career, see *Encyclopædia Britannica*). During the New Deal era Green generally opposed the principle of federal intervention in labour-management affairs; he was against the Wage-Hour act of 1938 and legislation proposed during World War II to enforce compulsory arbitration of industrial disputes. In Jan. 1942, however, shortly after Pearl Harbor, Green and Philip Murray of the Congress of Industrial Organizations both agreed to a labour truce for the duration of World War II. An effective adversary of Communism in the U.S. labour movement, Green resisted all Communist attempts to infiltrate A.F. of L. unions and refused to join the World Federation of Trade Unions in 1945 even before soviet domination of the W.F.T.U. had become evident.

Green denounced the Taft-Hartley act in 1947 as a "tragic mistake." He worked actively for the election of Pres. Harry S. Truman in 1948 and for Adlai E. Stevenson in 1952.

Gregory, Sir Richard (Arman), British physicist and meteorologist (b. Bristol, Eng., Jan. 29, 1864—d. Middleton-on-sea, Eng., Sept. 15, 1952).

Groll, Albert Lorey, U.S. artist (b. New York, N.Y., Dec. 8, 1866—d. New York, Oct. 2, 1952), graduated from the Royal academy at Munich, Ger., in 1899, then returned to the United States to take up residence in Arizona. There he specialized in desert landscapes that were often compared with the work of Frederic Remington and Winslow Homer. Groll was named a National academician in 1910 and was elected to the National Institute of Arts and Letters in 1932. His work is represented in a number of museums throughout the United States, and he was the recipient of a number of U.S. art awards and medals.

Grousset, René, French author and historian (b. Grenoble, Fr., Sept. 5, 1885—d. Paris, Fr., Sept. 12, 1952).

Grumbach, Salomon, French politician (b. Hattstatt, Alsace, Jan. 6, 1884—d. Neuilly, Fr., July 13, 1952).

Hached, Farhat, Tunisian labour leader (b. Kerkennah Islands, Tunisia, 1914—d. near Tunis, Tunisia, Dec. 5, 1952).

Haden, Russell Landram, U.S. physician and Red Cross official (b. Palmyra, Va., May 22, 1888—d. Cleveland, O., April 26, 1952).

Hahne, Ernest Herman, U.S. educator (b. Walker, Kan., Oct. 20, 1890—d. Oxford, O., Nov. 25, 1952), received his A.B. and LL.B. degrees at the University of Nebraska, Lincoln, his M.A. from Harvard university in 1914 and his Ph.D. from The University of Chicago in 1930. After teaching sociology and economics at Nebraska, Chicago and Dakota Wesleyan university, Mitchell, S.D., he joined the faculty of Northwestern university, Evanston, Ill., in 1919, becoming full professor of economics in 1935; he was also director of the summer session there from 1930 to 1939. In 1946 he was named president of Miami university at Oxford, O., serving in this position until his death.

Hamilton, Cicely Mary, British author, playwright, journalist and actress (b. London, Eng., 1872—d. London, Dec. 6, 1952).

Hamsun, Knut, Norwegian novelist (b. Lom, Nor., Aug. 4, 1859—d. Noerholm, Nor., Feb. 19, 1952), started life as a shoemaker's apprentice. He later emigrated to the United States and there attempted unsuccessfully to become a Unitarian minister. He returned to Norway in 1884, but was back in the U.S. two years later, working as a farm labourer in North and South Dakota and as a streetcar conductor in Chicago, Ill. In 1888 he returned to Europe and settled in Copenhagen, Den., publishing in 1890 his first literary success, the novel *Sult* (translated as *Hunger*). His greatest novel, *Markens Grøde* (*Growth of the Soil*), was published in 1917, and he was awarded the Nobel prize in 1920. His translated novels also include *Sejlgjess Town* (1915), *Vagabonds* (1927) and *August* (1930). In World War I Hamsun was pro-German and in his later years he became pro-Nazi. Arrested in 1945, he faced trial in 1946. Psychiatrists declared him to be prematurely weakened in mind and he was sentenced only to pay kr. 325,000 as indemnity for wartime earnings. His work portrays the individual's struggle against hunger and poverty and society.

Harding, Lyn (DAVID LLEWELLYN HARDING), British actor (b. St. Bride's near Newport, Monmouthshire, Eng., Oct. 12, 1867—d. Southend, Essex, Eng., Dec. 26, 1952).

Harmsworth, Sir Harold Cecil Aubrey, British newspaper publisher (b. June 13, 1897—d. London, Eng., Sept. 7, 1952).

Haskell, Henry Joseph, U.S. editor (b. Huntington, O., March 8, 1874—d. Kansas City, Mo., Aug. 20, 1952), was educated at Oberlin (O.) college, where he received his bachelor's degree in 1896. In 1898 he joined the staff of the *Kansas City Star*, becoming director of the editorial page in 1910 and editor in 1928. He was twice awarded the Pulitzer prize—for excellence of his editorial page in 1933 and for distinguished editorial writing in 1944. An acute observer of foreign affairs, he wrote numerous articles for the North American Newspaper Alliance. He was also author of *The New Deal in Old Rome* (1939) and *This Was Cicero* (1942).

Haskell, William Nafew, U.S. army officer (b. Albany, N.Y., Aug. 13, 1878—d. Greenwich, Conn., Aug. 13, 1952).

Hastings, Sir Patrick, British lawyer, government official and playwright (b. London, Eng., March 18, 1880—d. London, Feb. 26, 1952).

Hay, Ian (JOHN HAY BEITH), British writer (b. Manchester, Eng., April 17, 1876—d. near Petersfield, Hampshire, Eng., Sept. 22, 1952).

Heath, Bobby (ROBIN FREAR), U.S. song writer, author, pianist and composer (b. Philadelphia, Pa., Dec. 1, 1889—d. Philadelphia, March 3, 1952).

Hedin, Sven Anders, Swedish explorer (b. Stockholm, Swed., Feb. 19, 1865—d. Stockholm, Nov. 26, 1952), was educated at the Stockholm *högskola* (university) and at Uppsala, Berlin and Halle universities (for his early journeys, see *Encyclopedia Britannica*). He travelled round the world in 1923, through the United States, Mongolia and the U.S.S.R. In 1927 he organized the elaborate Sino-Swedish expedition which continued until 1935, and in 1947 he planned a journey to the Argentine. He was one of the 18 members of the Swedish Academy. His published works include *Through Asia* (1898), *Scientific Results of a Journey in Central Asia* (8 vol., 1899-1902), *Southern Tibet* (12 vol., 1917-22), *My Life as an Explorer* (1925), and *Scientific Results of the Sino-Swedish Expedition 1927-37* (35 vol., 1937-49).

Hem, Halvor Olsen, U.S. inventor and construction engineer (b. Saude, Nor., Aug. 14, 1863—d. Toledo, O., Nov. 11, 1952).

Henderson, Fletcher Hamilton, U.S. jazz musician and composer (b. Cuthbert, Ga., Dec. 18, 1897—d. New York, N.Y., Dec. 29, 1952), studied music at Atlanta (Ga.) university, then went to New York city in 1921 and organized his own jazz orchestra. As band leader, arranger for Benny Goodman, composer in his own right and developer of many other famous jazz musicians, Henderson was recognized as one of the greatest exponents of "swing" and "hot" music.

Henderson, Sir Hubert Douglas, British political economist (b. Oct. 20, 1890—d. Oxford, Eng., Feb. 22, 1952).

Henríquez y Carvajal, Federico, Dominican Republican educator and author (b. Santo Domingo (now Ciudad Trujillo), Dominican Republic, Sept. 16, 1848—d. Ciudad Trujillo, Feb. 4, 1952).

Herbert, Hugh, U.S. motion-picture actor (b. Binghamton, N.Y., Aug. 10, 1885—d. Hollywood, Calif., March 12, 1952), attended Cornell university, Ithaca, N.Y., and wrote several playlets and vaudeville skits before becoming known as an actor and comedian. His first association with motion pictures was in 1927 as the scenarist and an actor in *Mind Your Business*. He appeared in numerous pictures after 1933, including *Goodbye Again*, *Little Bit of Heaven*, *Hellzapoppin*, *A Midsummer Night's Dream* and *Top of the Town*. Herbert also starred in the stage play *Oh, Brother* and in a series of radio programs.

Herdon, Hugh, Jr., U.S. aviator (b. Titusville, Pa., Oct. 3, 1904—d. Cairo, Egy., April 5, 1952), made the first nonstop flight across the Pacific ocean with Clyde Pangborn in Oct. 1931. The flight was made from near Tokyo, Jap., to Wenatchee, Wash.—a distance of 4,833 mi.—in a small single-motor monoplane, with an elapsed time of 41 hr. 13 min. At the time of his death Herdon was middle and far eastern director of operations for a U.S. commercial air line.

Herrle, Colin, U.S. Red Cross official (b. Washington, D.C., July 9, 1892—d. Washington, Dec. 16, 1952).

Higger, Michael, U.S. legal scholar and rabbi (b. Rogovo, Lith., Jan. 6, 1898—d. New York, N.Y., Nov. 22, 1952).

Higgins, Andrew Jackson, U.S. shipbuilder (b. Columbus, Neb., Aug. 28, 1886—d. New Orleans, La., Aug. 1, 1952), attended Creighton university at Omaha, Neb., from 1903 to 1906, after which he became a lumber mill operator and exporter. In this business he acquired ownership of a large fleet of ships, and in 1930 organized his own shipbuilding company, Higgins Industries, Inc., at New Orleans. This company, which later expanded into aircraft and radio manufacture, became best known for its famed "Higgins boats" of World War II—troop and tank landing craft that were used in U.S. military operations throughout the world. Higgins was again awarded large U.S. defense contracts after the outbreak of the Korean war in 1950.

Holbrook, Lucius Roy, U.S. army officer (b. Arkansaw, Wis., April 30, 1875—d. San Francisco, Calif., Oct. 19, 1952).

Holland, Leicester Bodine, U.S. archaeologist and author (b. Louisville, Ky., May 23, 1882—d. Philadelphia, Pa., Feb. 7, 1952).

Hoover, William Harold, U.S. attorney and corporation executive (b. Lodi, O., April 20, 1889—d. Butte, Mont., June 6, 1952).

Horney, Karen, U.S. psychoanalyst and author (b. Hamburg, Ger., Sept. 16, 1885—d. New York, N.Y., Dec. 4, 1952).

Howe, Gene Alexander, U.S. editor (b. Atchison, Kan., March 22, 1886—d. near Amarillo, Tex., June 25, 1952).

Hrozný, Bedřich (FRIEDRICH), Czech orientalist (b. Lysa nad Labem, Bohemia, May 6, 1879—d. Prague, Czechoslovakia, Dec. 18, 1952), was educated at the universities of Prague, Vienna, Berlin and London. In 1905 he was appointed professor in Semitic languages at Vienna university and in 1919, when the state of Czechoslovakia was set up, he was appointed professor of cuneiform writings and the history of the ancient orient at Charles university, Prague. In 1915 he surprised the learned world with the news that he had read the Hittite language which, until then, had baffled many scholars. He contributed the article HITTITES in the *Encyclopædia Britannica*.

Hughes, William Morris, Australian statesman (b. London, Eng., Sept. 25, 1864—d. Sydney, Austr., Oct. 27, 1952), was prime minister of Australia during World War I (for his biography and a detailed account of his prime ministership see *Encyclopædia Britannica*). After his resignation as prime minister in 1923, Hughes continued to serve in a number of important government posts, including vice-president of the executive council (1934-35 and 1937-38), minister for health and repatriation (1934-35 and 1936-37), minister in charge of territories (1937-38), minister for external affairs (1937-39), minister for industry (1939-40), attorney general (1939-41) and minister for the navy (1940-41). For the last few years of his life he was senior statesman of the Commonwealth of Nations.

Hull, Clark Leonard, U.S. psychologist (b. Akron, N.Y., May 24, 1884—d. New Haven, Conn., May 10, 1952).

Hume, Edgar Erskine, U.S. army medical officer (b. Frankfort, Ky., Dec. 26, 1889—d. Washington, D.C., Jan. 24, 1952).

Humes, Augustine Leftwich, U.S. lawyer (b. Knoxville, Tenn., Nov. 16, 1874—d. New York, N.Y., Sept. 25, 1952).

Hummel, George F., U.S. author (b. Southold, L.I., N.Y., Sept. 3, 1882—d. New York, N.Y., Dec. 20, 1952).

Hunt, Edward Lawrence, U.S. Presbyterian minister (b. Dundas, Ont., Sept. 16, 1860—d. Queens, N.Y., Oct. 9, 1952).

Hunt, Myron, U.S. architect (b. Sunderland, Mass., Feb. 27, 1868—d. Pasadena, Calif., May 26, 1952).

Huntress, Carroll Benton, U.S. businessman (b. Ogdensburg, N.Y., Nov. 25, 1885—d. Mount Vernon, N.Y., Nov. 29, 1952).

Hussey, Mary Ida, U.S. educator and philologist (b. New Vienna, O., June 17, 1876—d. Andover, Mass., June 20, 1952), took her Ph.B. degree at Earlham college, Richmond, Ind., in 1896 and her Ph.D. at Bryn Mawr college, Pa., in 1906. She was an instructor at Wellesley college, Mass., from 1907 to 1909, and associate professor and professor at Mt. Holyoke college, South Hadley, Mass., from 1913 until her retirement in 1941. She was a noted authority on ancient languages and religions and conducted extensive field research in the near, middle and far east, serving as field secretary of the American Schools of Oriental Research from 1917 to 1933.

Hyde, Charles Cheney, U.S. lawyer and educator (b. Chicago, Ill., May 22, 1873—d. New York, N.Y., Feb. 13, 1952), was educated at Yale university and at Harvard, where he received his law degree in 1898. He practised law in Chicago from 1898 to 1923 and was a solicitor for the U.S. department of state from 1923 to 1925. He also taught law at Northwestern university in Chicago during the years 1907-25 and was professor of international law and diplomacy at Columbia university from 1925 to 1945. In May 1951 Pres. Harry S. Truman appointed him a member of the Permanent Court of Arbitration at The Hague, Neth. Hyde was the author of a standard work on international law (2 vol., 1922; 2nd rev. ed. 3 vol., 1945) and a biography of Charles Evans Hughes as U.S. secretary of state (1929).

Ickes, Harold Le Clair, U.S. former secretary of the interior (b. Frankstown township, Blair county, Pa., March 15, 1874—d. Washington, D.C., Feb. 3, 1952). For Ickes' earlier career, see *Encyclopedia Britannica*. He was appointed secretary of the interior by Pres. Franklin D. Roosevelt in March 1933 and remained in this post through all the Roosevelt administrations and during the first ten months of the Harry S. Truman administration. He resigned from the cabinet on Feb. 13, 1946, after a dispute with President Truman over the latter's nomination of Edwin W. Pauley as undersecretary of the navy. Following his resignation he wrote a newspaper column on national affairs. His memoirs, *Autobiography of a Curmudgeon*, were published in 1943.

Ingram, Jonas Howard, U.S. naval officer (b. Jeffersonville, Ind., Oct. 15, 1886—d. San Diego, Calif., Sept. 10, 1952), graduated in 1907 from the U.S. Naval academy, where he starred in football, rowing and track and was later head football coach (1915-17) and director of athletics (1926-30). For his service during the U.S. attack on Veracruz, Mex., in 1914 Ingram was awarded the congressional medal of honour. In World War I he was flag lieutenant to Rear. Adm. Hugh Rodman. After various other naval duties he was named commander of the Atlantic cruiser division in 1941 and the following year was appointed commander of Allied naval forces in the South Atlantic. Also commander in chief of the U.S. Atlantic fleet during World War II, he supervised the convoy of hundreds of thousands of U.S. troops to the European theatre. Advanced to the rank of full admiral in 1944, Ingram retired from the navy in 1947.

Innis, Harold Adams, Canadian political economist (b. Otterville, Ont., Nov. 5, 1894—d. Toronto, Ont., Nov. 8, 1952).

Ipatieff, Vladimir Nikolaevich, Russian-born U.S. chemist (b. Moscow, Russia, Nov. 9, 1867—d. Chicago, Ill., Nov. 29, 1952).

Irvin, William Adolf, U.S. industrialist (b. Indiana, Pa., Dec. 7, 1873—d. New York, N.Y., Jan. 1, 1952), began work as a railroad telegraph operator in 1888. Employed as a clerk in a steel and tin plant in 1895, he rose rapidly in the steel industry and in 1932 became president of the U.S. Steel corporation, retiring in 1938. In 1942 he was elected chairman of the board of trustees of the National Safety council.

Jack, Richard, Canadian painter (b. Sunderland, Eng., Feb. 15, 1866—d. Montreal, Que., June 30, 1952), studied at the York (Eng.) School of Art and later at the Académie Julian in Paris, Fr. He was a member of the Royal Society of Portrait Painters and, at the time of his death, senior member of Britain's Royal academy. In 1916 he was commissioned by the Canadian government to paint battle scenes with the Canadian expeditionary forces; his "Vimy Ridge" and "Canadians at the Second Battle of Ypres" became widely known and were hung in the Canadian national archives at Ottawa. Jack also painted portraits of several Canadian governors general and other notables.

Jacobi, Frederick, U.S. composer (b. San Francisco, Calif., May 4, 1891—d. New York, N.Y., Oct. 24, 1952).

Jean, Philip Charles, U.S. authority on pediatrics (b. Hillsboro, O., Jan. 3, 1883—d. Panamá city, Pan., Oct. 22, 1952).

- Joannes, Francis Y.**, U.S. architect (b. Green Bay, Wis., Sept. 27, 1876—d. Branford, Conn., June 21, 1952).
- Joerg, Wolfgang Louis Gottfried**, U.S. geographer (b. Brooklyn, N.Y., Feb. 6, 1885—d. Washington, D.C., Jan. 7, 1952).
- John, Sir (William) Goscombe**, British sculptor (b. Cardiff, Wales, Feb. 21, 1860—d. London, Eng., Dec. 15, 1952).
- Johnson, Charles F. H.**, U.S. textile industrialist (b. New York, N.Y., Sept. 5, 1880—d. Passaic, N.J., May 9, 1952).
- Jolas, Eugene**, trilingual poet and journalist (b. Union City, N.J., Oct. 26, 1894—d. Paris, Fr., May 26, 1952), at the age of two returned with his European-born parents to the father's ancestral home in Forbach, Lorraine, where he received his early schooling at the local *gymnasium* and, later, at the Petit Séminaire, Metz. At 16 he emigrated alone to the U.S. and after a few years of bitter economic struggle entered the newspaper world. He returned to Europe in 1922 and, in 1927, founded in Paris the international *avant garde* review *Transition*. In addition to many critical articles, he was the author of seven volumes of poetry, written in French, German, English and an invented linguistic amalgam he called "Atlantica"; a French-language anthology of more than 100 American poets; an English-language mystical anthology entitled *Vertical*; and numerous translations. He served in World Wars I and II and, in 1946, was awarded the U.S. Medal of Freedom for his activities with the Allied armies during the liberation of Europe.
- Jooda Shum Shere Jung Bahadur Rana**, maharaja, former Nepalese prime minister (b. Katmandu, Nepal, April 24, 1875—d. Dehra Dun, Uttar Pradesh, India, Nov. 23, 1952).
- Kaas, Ludwig**, German-born Roman Catholic prelate, former head of Centrist party in Germany (b. Trier, Ger., May 23, 1881—d. Rome, It., April 25, 1952).
- Kaplan, Eliezer**, Israeli statesman (b. Minsk, Russia, Jan. 27, 1891—d. Genoa, It., July 13, 1952).
- Karfiol, Bernard**, U.S. artist (b. Budapest, Hung., May 6, 1886—d. Irvington-on-Hudson, N.Y., Aug. 16, 1952).
- Kellor, Frances**, U.S. immigration authority and author (b. Columbus, O., Oct. 20, 1873—d. New York, N.Y., Jan. 4, 1952).
- Kelly, Alvin Anthony** ("SHIPWRECK"), U.S. stunt man (b. May 13, 1893—d. New York, N.Y., Oct. 11, 1952).
- Kelser, Raymond Alexander**, U.S. bacteriologist and immunologist (b. Washington, D.C., Dec. 2, 1892—d. Philadelphia, Pa., April 16, 1952).
- Kendall, Elizabeth Kemball**, U.S. historian, educator and traveller (b. Middlebury, Vt., 1895?—d. Village of Street, Somerset, Eng., May 15, 1952).
- Kennedy, Foster**, U.S. neurologist (b. Belfast, Ire., Feb. 7, 1884—d. New York, N.Y., Jan. 7, 1952).
- Kenny, Elizabeth** (SISTER KENNY), Australian nursing sister and research worker (b. Warialda, New South Wales, Austr., Sept. 20, 1886—d. Too-womba, Queensland, Austr., Nov. 30, 1952), qualified as a nurse in 1911 and served in the Australian army nursing service during World War I. She soon became known for her physical methods of treatment of poliomyelitis which, she claimed, could cure the paralysis if applied early enough. Her claims were strenuously opposed by the medical profession although the value of her treatment was admitted. She opened a clinic in Sydney in 1935 and a year's trial of her methods was made in Great Britain in 1937. In 1940 she went to the United States where the Elizabeth Kenny foundation was later established at Minneapolis, Minn. Other clinics adopting the Kenny method were opened in New York city, Buffalo, N.Y., Jersey City, N.J., Pontiac, Mich., and El Monte, Calif. She returned to Australia in Dec. 1950. Her published works include *Infantile Paralysis and Cerebral Diplegia* (1937), *The Kenny Concept of Infantile Paralysis and Its Treatment* (with J. F. M. Pohl, 1943) and an autobiography, *And They Shall Walk* (with Martha Ostenson, 1943).
- Kent, Roland Grubb**, U.S. philologist (b. Wilmington, Del., Feb. 24, 1877—d. Bryn Mawr, Pa., June 27, 1952).
- Kenyon, Sir Frederic George**, British biblical and classical scholar and museum director (b. London, Eng., Jan. 15, 1863—d. Godstone, Surrey, Eng., Aug. 23, 1952), was educated at Winchester and at New College, Oxford university, of which he became an honorary fellow in 1913. In 1888 he became a fellow of Magdalen college (honorary fellow, 1906) and a year later he entered the manuscript department of the British Museum where he became known as an authority on Greek papyri by his discovery and publication, as *Aristotle's Constitution of Athens* (1891), of a lost treatise by Aristotle. He was assistant keeper in the manuscript department, 1898–1909, and director and principal librarian of the museum, 1909–30. He was also a distinguished Biblical scholar, and his works in this field include *Our Bible and the Ancient Manuscripts* (1895, rev. 1939) and *The Bible and Modern Scholarship* (1948), a reply to Bishop E. W. Barnes's *The Rise of Christianity*. Kenyon was president of the British academy, 1917–21, of the Bibliographical society, 1924–26, of the Society of Antiquaries, 1934–39, and of the British School of Archaeology at Jerusalem from 1920 until his death. His other published works include *Catalogue of Greek Papyri in the British Museum*, 3 vol. (1893–1907), *Ancient Books and Modern Discoveries* (1928) and *The Chester Beatty Biblical Papyri*, 8 parts (1933–41).
- Kerner, Otto**, U.S. jurist (b. Chicago, Ill., Feb. 22, 1884—d. Chicago, Dec. 13, 1952).
- Keys, Clement Melville**, Canadian-born business executive (b. Chatsworth Ont., April 7, 1876—d. New York, N.Y., Jan. 12, 1952).
- Kimball, Dexter Simpson**, U.S. educator and engineer (b. New River, N.B., Oct. 21, 1865—d. Ithaca, N.Y., Nov. 1, 1952).
- King, Mrs. Carol**, U.S. attorney (b. New York, N.Y., Aug. 24, 1895—d. New York, Jan. 21, 1952).
- Kirby, Rollin**, U.S. cartoonist (b. Galva, Ill., Sept. 4, 1875—d. New York, N.Y., May 8, 1952), went to New York city as a youth to study painting. After further studies in Paris he turned to magazine illustration, working for *Collier's*, *American*, *Harper's* and others. In 1911 the *New York Evening Mail* hired him as a cartoonist; the next year he moved to the *Sun* and in 1913 to the *World* (later the *World-Telegram*), where he remained until 1939. From the latter year until 1942 he was with the *New York Post* and subsequently did cartoons for *Look* magazine and the *New York Times* Sunday magazine. A three-time Pulitzer prize winner (1921, 1924 and 1928), Kirby was a powerful cartoon critic of Tammany hall, the Ku Klux Klan, prohibition, high finance, communism and fascism. One of his best-known pen characters was "Mr. Dry," a tall bluenose symbolizing the 18th amendment.
- Kirsten, Frederick Kurt**, U.S. inventor and engineer (b. Saxony, Ger., March 13, 1885—d. Seattle, Wash., Nov. 19, 1952).
- Klapper, Paul**, U.S. educator (b. Jassy, Rum., July 17, 1885—d. Flushing, Queens, N.Y., March 25, 1952).
- Kollontai (KOLLONTAY), Alexandra Mikhailovna**, Russian diplomat and political leader (b. St. Petersburg [Leningrad], Russia, April 1, 1872—d. Moscow, U.S.S.R., March 9, 1952).
- Kramers, Hendrick Anthony**, Dutch atomic scientist (b. Rotterdam, Neth., Dec. 17, 1894—d. Leyden, Neth., April 24, 1952).
- Kucharzewski, Jan**, Polish politician and historian (b. Wysokie Mazowieckie, Pol., May 27, 1876—d. New York, N.Y., July 4, 1952), was educated at the University of Warsaw. In 1915 he went to Lausanne, Switz., where he published *L'Aigle Blanc*, a periodical campaigning for the restoration of independent Poland. On Nov. 26, 1917, he was appointed premier by the Polish regency council of the first Polish government since 1831; he resigned on Feb. 27, 1918, in protest against the peace treaties of Brest-Litovsk. After World War I he devoted himself to historical studies and published *From the White to the Red Tsardom*, 7 vol. (Warsaw, 1923–35) abridged trans., *The Origins of Modern Russia* (1948). In 1926 Kucharzewski was elected a member of the Polish Academy of Sciences. He left Poland at the beginning of 1940 for New York city where he became chairman of the board of the Polish Institute of Arts and Sciences in America.
- Kulas, Elroy John**, U.S. steel executive (b. Cleveland, O., March 21, 1880—d. Gates Mills, O., May 13, 1952).
- Lamb, Arthur Becket**, U.S. chemist (b. Attleboro, Mass., Feb. 25, 1880—d. near Brookline, Mass., May 15, 1952), was educated at Tufts college, Medford, Mass., at Harvard, and at the Universities of Leipzig and Heidelberg, Ger.; he received his Ph.D. from Harvard in 1904. He began as an instructor in electrochemistry at Harvard in 1905, then taught at New York university (1906–12). Returning to Harvard in the latter year, he became full professor in 1920. He was also director of the Harvard chemistry laboratory from 1912 until his retirement in 1947, and was a recipient of the Priestley medal, highest award of the American Chemical society. From 1917 to 1949 he was editor of the *Journal of the American Chemical society*.
- Lamb, William Frederick**, U.S. architect (b. Brooklyn, N.Y., Nov. 21, 1883—d. New York, N.Y., Sept. 8, 1952).
- Lambert, Adrian Van Sinderen**, U.S. surgeon (b. New York, N.Y., June 30, 1872—d. New York, Oct. 15, 1952).
- Lamont, Florence Corliss** (MRS. THOMAS W. LAMONT), U.S. civic worker (b. Englewood, N.J.—d. New York, N.Y., Dec. 29, 1952).
- Landau, Jacob**, Austrian-born journalist (b. Vienna, Aus., 1892?—d. New York, N.Y., Jan. 31, 1952).
- Lapierre, Louis A.**, Canadian-born Roman Catholic prelate, last free Roman Catholic apostolic vicar in Communist China (b. St. Hermas, Que., 1880?—d. Manchuria, Dec. 27, 1952).
- Lasker, Albert Davis**, U.S. advertising executive and philanthropist (b. Freiburg, Ger., May 1, 1880—d. New York, N.Y., May 30, 1952), was born of U.S. parents who were travelling in Germany. In 1898, two years after his graduation from high school at Galveston, Tex., he joined the advertising firm of Lord & Thomas, becoming sole owner in 1908. A pioneer in modern advertising methods, he placed as much as \$50,000,000 worth of advertising a year before disbanding his company in 1942. In 1917 he was named assistant secretary of agriculture by Pres. Woodrow Wilson, and from 1918 to 1920 was assistant chairman of the Republican national committee. He was also chairman of the U.S. shipping board under Pres. Warren G. Harding from 1921 to 1923. Upon his retirement from business in 1942 he founded the Albert and Mary Lasker foundation for medical research. Among other philanthropies, he gave The University of Chicago \$1,250,000 for research in geriatrics, plus an estate in suburban Chicago valued at \$3,000,000.
- Lattre de Tassigny, Jean-Joseph-Marie-Gabriel de**, French army officer (b. Mouilleron-en-Pareds, Vendée, Fr., Feb. 2, 1889—d. Neuilly near Paris, Fr., Jan. 11, 1952), a graduate of Saint-Cyr, fought in World War I, and was wounded four times and decorated. In 1921 he served in Morocco and in 1925 was seriously wounded in the Rif campaign. Having passed out of the *École Supérieure de Guerre* in 1935, he was by 1939 the youngest general in

the French army. He commanded the 14th infantry division which fought around Rethel in May 1940. On Aug. 27, 1941, he was appointed commander-in-chief in Tunisia but in Jan. 1942 was recalled to France to command a division at Montpellier. When the Germans took over the free zone on Nov. 11, 1942, he attempted to resist. He was sentenced on Jan. 9, 1943, to ten years' imprisonment at Riom but nine months later escaped to England. He took over the French 1st army which landed at Saint Tropez on Aug. 15, 1944. Advancing up the Rhône valley, he crossed the Rhine, entered the upper Danube valley and brought his troops to the Tirol. On May 8, 1945, in Berlin he signed for France the final act of German capitulation; on July 24 he was appointed inspector general of the French army. He was appointed commander-in-chief of land forces of the Western European Union on Oct. 4, 1948. He became French high commissioner and commander-in-chief in Indochina on Dec. 6, 1950. General de Lattre was posthumously created marshal of France.

Lawrence, Gertrude (GERTRUD ALEXANDRA DAGMA LAWRENCE KLASSEN), British actress (b. London, Eng., July 4, 1898—d. New York, N.Y., Sept. 6, 1952), was educated at the Convent of the Sacred Heart, Streatham, London, and studied dancing under Madame Espinosa and acting under Italia Conti. She first appeared on the stage in Dec. 1910, at the Brixton theatre, London, as a child dancer in *Babes in the Wood*; after touring in the provinces for four and a half years she achieved her first stage success in the revue *Some* (1916). Her talent for singing, dancing and acting and her vivacious personality were admirably suited to this type of production and she was soon in great demand. She took the lead in *The Midnight Follies* (1922) and afterward went to the U.S. where she played joint lead with Beatrice Lillie in *André Charlot's Revue of 1924*. She was a close friend of Noel Coward who wrote *Private Lives* (1930) specially for her and with whom she toured the provinces in 1935 in *Tonight at 7:30* (renamed *Tonight at 8:30* when it ran in London and New York in 1936). Her best-known later performances were Susan Trexel in *Susan and God* (New York, 1937), Lydia Kenyon in *Skylark* (New York, 1939) and, in London, Stella Martyn in *Daphne du Maurier's September Tide* (1948). During World War II she had toured with the Entertainments National Service association (of which she was president of the U.S. branch) in France and Belgium and with the United Services organizations (U.S.O.) in the Pacific ocean area. At the time of her death she was playing Anna in *The King and I* in New York.

Lawson, Andrew Cowper, U.S. geologist (b. Anstruther, Scot., July 25, 1861—d. San Leandro, Calif., June 16, 1952).

Lee, Canada (LIONEL CORNELIUS CANEGATA), U.S. Negro actor (b. New York, N.Y., May 3, 1907—d. New York, May 9, 1952), studied the violin as a child, became a jockey at 14 and a boxer at 19. Turning professional, he was a leading contender for the world welterweight boxing championship in the late 1920s when his eyes failed. He then organized a dance band and became interested in the theatre. His first role was in a federal theatre production; he rose to national stardom as Bigger Thomas in Richard Wright's *Native Son* (1941), directed by Orson Welles. His Banquo in Welles's all-Negro interpretation of *Macbeth* and his Othello both won wide acclaim. Lee was also a frequent performer in motion pictures, radio and television and played the lead role in the film *Cry, the Beloved Country*, which had its first showing in New York city a few months before his death.

Lee, Frank Hood, U.S. politician, lawyer and newspaperman (b. Johnson county, Kan., March 29, 1873—d. Joplin, Mo., Nov. 20, 1952).

Lefranc, Abel, French scholar and historian (b. Elincourt-St. Marguerite, Fr., July 27, 1863—d. Paris, Fr., Nov. 26, 1952).

Levinthal, Bernard Louis, U.S. rabbi (b. Vilna, Russia, May 12, 1865—d. Atlantic City, N.J., Sept. 23, 1952), emigrated to the United States in 1891. At the time of his death he was head of the Orthodox rabbinate of Philadelphia. He was a founder of the Orthodox Rabbinical Association of America and was active in many U.S. Jewish associations.

Levy, Louis, French editor and Socialist leader (d. London, Eng., Feb. 16, 1952).

Lewis, David John, U.S. legislator (b. near Osceola Mills, Pa., May 1, 1869—d. Cumberland, Md., Aug. 12, 1952), began work at the age of nine in the coal mines of Allegany county, Md. He studied law in the office of an attorney at Cumberland, being admitted to the Maryland bar in 1892. He set up practice in Cumberland and was a Maryland state senator from 1902 to 1906. In 1910 he was elected to the U.S. house of representatives as a Democrat from the 6th Maryland district, serving in the 62nd, 63rd and 64th congresses (1911-17). From 1917 to 1925 he was a member of the U.S. Tariff commission, and later he resumed private practice of law. Elected again to the house of representatives, he served in the 72nd-75th congresses (1931-39) and thereafter was a member of the National Mediation board until 1943, when he retired from public life. Lewis first became a national political figure when he drafted the legislation that established the U.S. parcel post system. His legislative work with unemployment insurance became one of the bases for the U.S. social security system.

Lewis, Howard Corwin, U.S. book publisher (b. New York, N.Y., Oct. 9, 1890—d. New York, Oct. 2, 1952).

Lillie, Ralph Stayner, Canadian-U.S. biologist (b. Toronto, Ont., Aug. 8, 1875—d. Chicago, Ill., March 19, 1952), received his bachelor's degree from the University of Toronto in 1896 and his Ph.D. from The University of Chicago in 1901. He taught physiology at Harvard university, the University of Nebraska, The Johns Hopkins university, the University of Pennsylvania and Clark university (Worcester, Mass.) before joining the faculty of The University of Chicago in 1924 as professor of general physiology. He retired in 1940. His research in the basic nature of living matter became known internationally.

Lindsay, Alexander Dunlop, British educator (b. Glasgow, Scot., May 14, 1879—d. Keele Hall, Stoke-on-Trent, Staffordshire, Eng., March 18, 1952).

Link, Henry Charles, U.S. psychologist (b. Buffalo, N.Y., Aug. 27, 1889—d. Port Chester, N.Y., Jan. 9, 1952).

Linlithgow, Victor Alexander John Hope, 2ND MARQUESS, former viceroy of India (b. Abercorn, West Lothian, Scot., Sept. 24, 1887—d. Hopetoun, West Lothian, Scot., Jan. 5, 1952).

Lin Piao, Chinese Communist leader and army officer (b. Hupeh province, China, 1908?—d. Moscow, U.S.S.R., Oct. 17, 1952), was reported to be the fifth-ranking member of the Chinese Communist regime at the time of his death. He was credited with a major military role in the Communists' victory over the Chinese nationalists in 1949 and was commanding general of the Chinese Communist land forces that intervened in the Korean war in 1950.

Lipman, Clara (MRS. LOUIS MANN), U.S. actress and dramatic playwright (b. Chicago, Ill., Dec. 6, 1869—d. New York, N.Y., June 22, 1952).

Lockridge, Ross Franklin, U.S. author (b. Miami county, Ind., Oct. 26, 1877—d. Bloomington, Ind., Jan. 12, 1952).

Long, Mrs. Margaret Gabrielle Campbell Vere (pseudonyms, MARJORIE BOWEN, GEORGE R. PREEDY, JOSEPH SHEARING), British novelist (b. Hayling, Hampshire, Eng., 1888—d. London, Eng., Dec. 23, 1952).

Long, Percy Waldron, U.S. educator and author (b. Boston, Mass., Sept. 21, 1876—d. Washington, D.C., Oct. 2, 1952).

Long, William Joseph, U.S. author, naturalist and Congregationalist clergyman (b. North Attleboro, Mass., April 3, 1866—d. Stamford, Conn., Nov. 9, 1952).

Lot, Ferdinand, French historian (b. Paris, Fr., Sept. 20, 1866—d. near Paris, July 20, 1952).

Lyot, Bernard, French astronomer (b. Paris, Fr., Feb. 27, 1897—d. Cairo, Egy., April 1, 1952).

Macauley, Alvan, U.S. business executive (b. Wheeling, W.Va., Jan. 17, 1872—d. Clearwater, Fla., Jan. 16, 1952).

MacCarthy, Sir Desmond, British author and literary critic (b. Plymouth, Eng., 1877—d. Cambridge, Eng., June 7, 1952), was educated at Eton and at Trinity college, Cambridge. In early life he practised freelance journalism, contributing to the *Speaker* and the *Eye Witness* (later the *New Witness*). From 1913 to 1944 he was dramatic critic of the *New Statesman* and from 1920 to 1927 its literary editor. In addition from 1920 to 1929 he wrote a causerie for that weekly under the pseudonym "Affable Hawk." From 1928 until his death he was literary critic of the *Sunday Times* and he also broadcast for the British Broadcasting company. His principal books include *The Court Theatre* (1904-07), *Portraits* (1931), *Leslie Stephen* (1937) and two volumes of essays, *Drama* (1940) and *Shaw* (1950). MacCarthy had a wide and carefully cultivated knowledge of literature, although his criticism was most revealing when its approach was biographical (as in his appreciation of Henry James) rather than purely literary. He was knighted in 1951.

McCarthy, Leighton Goldie, Canadian diplomat, business executive and attorney (b. Walkerton, Ont., Dec. 15, 1869—d. Penetanguishene, Ont., Oct. 4, 1952), was the first Canadian ambassador to the United States. Educated at the public schools of Barrie, Ont., he studied law and entered politics as a Liberal, serving in the Canadian house of commons from 1898 to 1908. He then turned to practice of law in Toronto and became an executive of several large Canadian corporations, including the Canada Life Assurance company and the National Trust Company, Ltd. In 1941 McCarthy was named minister to Washington, D.C., and in 1943 the first ambassador to the United States after the legation had been raised to the status of embassy. He resigned Dec. 31, 1944.

McCrea, Charles, Canadian politician (b. Springtown, Ont., Dec. 27, 1877—d. Toronto, Ont., Oct. 30, 1952).

1952 OBITUARIES: Gertrude Lawrence, British actress; Brien McMahon, U.S. senator; Ferenc Molnar, Hungarian-U.S. dramatist; Maria Montessori, Italian educator; Philip Murray, U.S. labour leader

McCullagh, Clement George, Canadian newspaper publisher (b. London, Ont., March 16, 1905—d. Toronto, Ont., Aug. 5, 1952).

McDaniel, Hattie, U.S. Negro actress (b. Wichita, Kan., 1895?—d. near Los Angeles, Calif., Oct. 26, 1952), first appeared on the stage at the age of 16 in a touring tent show written and produced by her older brother. Later she was featured as a dance band singer and in vaudeville. She entered motion pictures in the early 1930s and almost immediately rose to stardom, appearing in about 300 pictures—notably as the "mammy" in *Gone With the Wind*. For this role she received the 1939 Academy award as the best supporting actress of the year—the first of her race to be so honoured. Other notable film performances by Miss McDaniel were in *Judge Priest*, *Genlle Julia*, *Saratoga*, *Nothing Sacred*, *The Male Animal*, *The Little Colonel* (with Shirley Temple) and *The Great Lie* (with Bette Davis). She became even more famous, however, for her role as Beulah on radio and television, playing this part until illness forced her to retire in 1951.

McInerney, Thomas H(enry), U.S. business executive (b. Dubuque, Ia., May 8, 1867—d. Greenwich, Conn., Sept. 30, 1952).

Mackay, Ian, British columnist and author (b. Wick, Scot., April 23, 1898—d. Morecambe, Eng., Oct. 3, 1952).

Madagan, Sir Edward Douglas, British statesman (b. Punjab, India, Aug. 25, 1864—d. London, Eng., Oct. 22, 1952).

McMahon, Brien, U.S. senator (b. Norwalk, Conn., Oct. 6, 1903—d. Washington, D.C., July 28, 1952), received his bachelor's degree from Fordham university, New York city, in 1924 and his LL.B. degree from Yale in 1927. Admitted to the Connecticut bar in the latter year, he practised law in Norwalk and in 1933 became judge of the Norwalk city court. Later that year he was appointed special assistant to the U.S. attorney general, and in 1936–39 he was assistant attorney general in charge of the department of justice criminal division. From 1939 to 1944 he again practised law; in the latter year he was elected U.S. senator from Connecticut on the Democratic ticket. In 1950 he was re-elected for the term 1951–57. During his freshman year in the senate McMahon introduced the first act for the control of atomic energy, and in Oct. 1945 he was named chairman of the special congressional committee on atomic energy. Generally a loyal supporter of the Harry S. Truman administration, McMahon thereafter spent much of his time in the senate on the work of his committee. On Feb. 2, 1950, he proposed a five-year, \$50,000,000,000 plan whereby the U.S. would extend economic aid to other countries, including the U.S.S.R., in exchange for total atomic disarmament. He repeatedly warned that the only alternative to control of atomic weapons was the destruction of civilization. McMahon was a candidate for the Democratic presidential nomination in 1952 but withdrew because of illness. He died two days after the close of the Democratic convention in Chicago, Ill.

McMillin, Alvin Nugent ("Bo"), U.S. football coach (b. Prairie Hill, Tex., Jan. 12, 1899—d. Bloomington, Ind., March 31, 1952).

McNally, John Thomas, Canadian Roman Catholic prelate (b. Hope River, P.E.I., June 24, 1871—d. Halifax, N.S., Nov. 17, 1952), was educated at Prince of Wales college, Charlottetown, P.E.I., at Ottawa university, Ont., and at the Canadian college in Rome. Ordained priest at Rome in 1896, he was successively bishop of Calgary, Alta. (1913–24), bishop of Hamilton, Ont. (1924–37), and archbishop of Halifax, N.S., from 1937 until his death.

McNamee, Luke, U.S. naval officer and business executive (b. Mount Hope, Wis., April 4, 1871—d. Newport, R.I., Dec. 30, 1952).

Mansbridge, Albert, British educationist (b. Gloucester, Eng., Jan. 10, 1876—d. Torquay, Eng., Aug. 22, 1952).

Marus, John, British newspaperman and radio broadcaster (b. London, Eng., Oct. 24, 1903—d. London, Oct. 27, 1952).

Massingham, Harold John, British author (b. London, Eng., March 25, 1888—d. Long Crendon, Eng., Aug. 22, 1952).

Matthews, Francis Patrick, U.S. statesman (b. Albion, Neb., March 15, 1887—d. Omaha, Neb., Oct. 18, 1952), took his law degree from Creighton university, Omaha, Neb., in 1913, then set up practice of law; he also engaged in business. Active in Democratic party work, he was counsel for the Reconstruction Finance corporation in Nebraska and Wyoming. On May 13, 1949, Pres. Harry S. Truman nominated him secretary of the navy. Early in 1950 Matthews was under congressional criticism for the ouster of Adm. Louis E. Denfeld as chief of naval operations, which came at the climax of interservice disputes over unification of the U.S. armed forces.

Matthews was again in public notice when he declared in a speech on Aug. 25, 1950, at Boston, Mass., that the U.S. should be willing to "pay any price" for world peace, "even the price of instituting a war to compel co-operation for peace." The White House and the U.S. state department promptly repudiated this speech as any reflection of official policy.

A prominent lay Catholic, Matthews was appointed U.S. ambassador to Ireland in June 1951, serving until his death, which occurred while he was on a visit back to the United States.

Maurras, Charles Marie-Photius, French writer and political journalist (b. Martigues, Provence, Fr., April 20, 1868—d. Tours, Fr., Nov. 16, 1952), was educated at the Catholic college at Aix-en-Provence and in 1895 went to Paris where he contributed to *L'Événement*, *Revue bleue* and *La Revue encyclopédique*. A fervent royalist, he undertook strenuous campaigns in *Le Soleil*, *La Gazette de France* and *Le Figaro* against democratic ideas and also published proroyalist books, notably *L'Idée de la décentralisation* (1898), *Trois idées politiques* (1898) and *L'Enquête sur la monarchie* (1900). From 1908 he directed the daily *L'Action française* (previously a fortnightly) which formed his main political platform. Its fundamental agnosticism, rather than its royalist propaganda, provoked the disapproval of the hierarchy so that, on Dec. 29, 1926, the Congregation of the Holy Office placed it and

some other of his works on the *Index Librorum Prohibitorum*. This ban continued until 1939 when Maurras made formal submission to the church. Meanwhile he had written *Kiel et Tanger* (1910), *L'Eclat de Berre* (1915) and *Quand les français ne s'aimaient pas* (1916). Although imprisoned in 1937 for incitement to murder Léon Blum, then premier, Maurras was elected in 1938 to the Académie Française. After the fall of France in 1940 he continued to publish *L'Action française* at Vichy. Although avowedly anti-British he repeatedly declared that Germany was the principal enemy of France. In 1945 he was sentenced in Lyons to life imprisonment for "intelligence with the enemy" during the occupation; at the same time the government ordered that he and Philippe Pétain should be expelled from the Académie Française. During his imprisonment he contrived to publish verse and articles in *Aspects de la France*. In March 1952 he was released from prison on grounds of ill-health. His other published works include *Les Amants de Venise* (1902), *La Musique intérieure* (1925), *De Dédos à César* (1935), *Apoloogie de Socrate* (1948) and *Conseils à un jeune Français* (1949). (See also *Encyclopædia Britannica*.)

Maximilian Eugene Louis, ARCHDUKE OF HABSBURG, Austrian prince (b. Vienna, Aus., April 13, 1895—d. Nice, Fr., Jan. 17, 1952).

Mays, Livingston T., U.S. Baptist leader, diplomat, educator and author (b. Round Rock, Tex.—d. Nashville, Tenn., Dec. 22, 1952).

Meissner, Alfred, Czech jurist and statesman (b. 1871—d. Vienna, Aus., May 23, 1952).

Merensky, Hans, South African geologist, discoverer of South African diamond and platinum fields (b. South Africa, 1871—d. Diuwelskloof, Transvaal, U. of S. Af., Oct. 21, 1952).

Metcalf, Tristram Walker, U.S. educator (b. Brooklyn, N.Y., Aug. 13, 1880—d. New York, N.Y., Feb. 24, 1952).

Meyerstein, Edward Harry William, British poet, novelist and biographer (b. Hampstead, Eng., Aug. 11, 1889—d. London, Eng., Sept. 12, 1952).

Migeod, Frederick William Hugh, British archaeologist and anthropologist (b. Chislehurst, Kent, Eng., Aug. 9, 1872—d. Worthing, Sussex, Eng., July 8, 1952).

Miller, Heymen Rudolph, U.S. bacteriologist, heart specialist and author (b. Russia, May 24, 1888—d. Poundridge, N.Y., Aug. 23, 1952).

Miller, Kenneth Hayes, U.S. artist (b. Oneida, N.Y., March 11, 1876—d. New York, N.Y., Jan. 1, 1952), studied in Europe and at the New York School of Art, where he later served as instructor in painting and drawing (1899–1911). From 1911 to 1936, and again in 1943, he taught at the Art Students League of New York. His work, represented in major U.S. museums, included etchings, drawings and paintings in oil and tempera. "Reverie," in oil, was awarded the Ada S. Garrett prize at the Art Institute of Chicago annual exhibit in 1945. Miller received the National Academy of Design's gold medal for painting in 1943 and was elected to the National Institute of Arts and Letters in 1947.

Miller, Leo Edward, U.S. explorer and author (b. Huntingburg, Ind., May 11, 1887—d. New Haven, Conn., Oct. 6, 1952).

Miller, Paul Gerard, U.S. educator (b. Pickett, Wis., Jan. 23, 1875—d. Oshkosh, Wis., May 21, 1952).

Minor, Robert, U.S. Communist leader (b. San Antonio, Tex., July 15, 1884—d. Ossining, N.Y., Nov. 26, 1952).

Molinari, Bernardino, Italian composer, musician and conductor (b. Rome, It., 1880—d. Rome, Dec. 25, 1952).

Molnar, Ferenc, Hungarian-U.S. dramatist (b. Budapest, Hung., Jan. 12, 1878—d. New York, N.Y., April 1, 1952), was the son of a Hungarian physician named Neumann. He attended the University of Budapest and later studied law at the University of Geneva, Switz. After a brief career in journalism he wrote his first play, *Der Doktor* (1902), which was produced at the royal theatre in Budapest and was well-received by critics. *Der Teufel (The Devil)* followed in 1908, and was produced in New York city by four companies at the same time. *Liliom*, perhaps the best-known of his 40-odd plays, was a failure when it opened at Budapest in 1909, but was an outstanding success when first produced in New York city by the Theatre Guild 12 years later. Subsequently it was revived a number of times and was made into a motion picture, *Carousel*, in 1945. *The Guardsman* opened in New York city in 1924 and was an immediate hit; it was notable also as being the first play in which Alfred Lunt and Lynn Fontanne appeared together. *The Play's the Thing* (1927) is also considered among Molnar's best work. Others included *Husbands and Lovers* (1924), *Prisoners* (1925), *Paul Street Boys* (1927), *The Swan* (1929), *The Good Fairy* (1932) and *No Greater Glory* (1934).

Molnar was a war correspondent with the Austro-Hungarian armies on the Russian front during World War I. He was the second Jewish recipient of the Order of Corvin, highest Hungarian literary distinction. In 1940, following Hungary's alignment with Nazi Germany, Molnar fled to the United States. He later became a U.S. citizen.

Momigliano, Attilio, Italian literary scholar and critic (b. Ceva, Piedmont, It., March 7, 1883—d. Florence, It., April 5, 1952).

Montagu, Ernest William Sanders, British politician, pioneer in the development of Southern Rhodesia (b. 1862—d. Salisbury, Southern Rhodesia, Nov. 20, 1952).

Montessori, Maria, Italian educator (b. Chiaravalle, Ancona, It., Aug. 31, 1870—d. Noordwijk, Neth., May 6, 1952), entered the University of Rome in Italy as a medical student and was the first Italian woman to gain a doc-

tor of medicine degree. Her lectures on mentally deficient children led to the foundation of the Scuola Ortofrenica, of which she was director from 1898 to 1900. She lectured on pedagogical anthropology from 1900 to 1907, when she founded her first nursery school, in the Rome slum district of San Lorenzo. In her *Casa dei Bambini* children were encouraged to make their own choice of occupation, with toys or simple tasks. (See MONTESSORI SYSTEM in *Encyclopedia Britannica*.) Her schools became established throughout Europe and the United States, and in 1913 the first international course on her methods was held in Rome. From 1919 onward she held training courses in London every two years and in alternate years in other parts of the world. She was made a government inspector of schools in Italy in 1922 and opened a teachers' training college there in 1928 and another in London in 1929. Forced to close her schools in Italy in 1934 because of her pacism, Dr. Montessori opened an institute in Barcelona, escaping from there in a British cruiser in 1936. She held training courses at Karachi, Poona and in Ceylon in 1939, but was interned as an enemy alien in Madras in June 1940. She returned to Italy in 1947 to reorganize schools there. Her ideas on education were set forth in *The Montessori Method* (1912).

Moore, Arthur Harry, U.S. politician (b. Jersey City, N.J., July 3, 1879—d. near Somerville, N.J., Nov. 18, 1952), was educated at Cooper union, New York city. His first political post was as secretary to the mayor of Jersey City (1908-11), and he was later city collector (1911-13) and one of the city's first commissioners (1913-25) after it had adopted the commission form of government in 1913. During the latter period he became the political protégé of Frank Hague, most powerful figure in New Jersey politics, and was elected governor of the state for two terms (1926-28 and 1932-35). He was elected U.S. senator on the Democratic ticket in 1934 for the term 1935-41 but resigned in 1938 after having again been elected governor of New Jersey. He was the first man in the state's history to be elected for a third term, and served from 1938 to 1941.

Moran, Polly (PAULINE THERESA MORAN), U.S. motion-picture actress (b. Chicago, Ill., June 28, 1885—d. Los Angeles, Calif., Jan. 25, 1952).

Morera, Berta (BERTHA MEYER), German operatic soprano (b. Mannheim, Ger., 1878—d. Rottach, Ger., Oct. 7, 1952).

Moulton, Forest Ray, U.S. astronomer (b. Le Roy, Mich., April 29, 1872—d. Wilmette, Ill., Dec. 7, 1952), took his bachelor's degree from Albion (Mich.) college in 1894 and his Ph.D. *summa cum laude* from The University of Chicago in 1899. He taught astronomy at The University of Chicago from 1898 until 1926, and from 1937 to 1948 he was administrative secretary of the American Association for the Advancement of Science. Moulton wrote a number of works on celestial mechanics and other phases of astronomy, but was perhaps best known as coauthor of the Chamberlin-Moulton planetesimal hypothesis of the origin of the solar system. He was also a noted authority on ballistics.

Murchison, Sir Charles Kenneth, British politician and author (b. London, Eng., Sept. 22, 1872—d. Mudeford, Hampshire, Eng., Dec. 17, 1952).

Murdoch, Sir Keith Arthur, Australian publisher (b. Melbourne, Austr., Aug. 12, 1886—d. Frankston, Austr., Oct. 5, 1952), was educated in Australian schools and at the London School of Economics. During World War I he was a war correspondent with the Australian forces at Gallipoli and on the French, Belgian and Italian fronts. Following the war he was London editor for a group of Australian papers. He later became chairman of the directors of The Herald and Weekly Times, Ltd., controlling the *Melbourne Sun News-Pictorial* (morning) and the *Melbourne Herald* (evening), and was also director of other newspapers and associated companies. Sir Keith, who was knighted in 1933, was an exponent of close U.S.-Australian relationship. He was director-general of information for the Commonwealth of Australia in 1939-40 and president of the trustees of the National Gallery of Victoria.

Murray, Philip, U.S. labour leader (b. Blantyre, Scot., May 25, 1886—d. San Francisco, Calif., Nov. 9, 1952), in 1902 moved with his family to the United States, where he was naturalized in 1911. The following year he became a member of the international executive board of the United Mine Workers of America, and he was the union's international vice-president from 1920 to 1942. In the latter year he was elected president of the United Steelworkers of America. In 1940 he succeeded John L. Lewis as president of the Congress of Industrial Organizations (C.I.O.) after Lewis had vowed he would resign if Pres. Franklin D. Roosevelt won election for a third term. Murray helped launch several rounds of wage increases after World War II, and in 1947 purposely violated the Taft-Hartley act to institute a test case, but was not prosecuted on technical grounds. During the 1948 presidential campaign Murray first attacked Pres. Harry S. Truman's labour policies but later backed Truman. In 1951 he predicted an eventual merger of the C.I.O. and the American Federation of Labor, but not until A.F. of L. leaders had changed their "ancient and prehistoric" points of view.

Immediately after the U.S. supreme court ruled on June 2, 1952, that President Truman's seizure of the steel industry was unconstitutional, Murray issued strike orders to the 650,000 members of the steelworkers' union. During the strike, which lasted until July 25, Murray charged that the large steel companies were conspiring to force the smaller companies not to agree to a strike settlement.

On Nov. 9, as Murray was preparing to open the annual C.I.O. convention Nov. 17, he died after a heart attack in San Francisco, Calif.

Lasalli-Rocca di Corneliano, Giovanni-Battista Cardinal, Italian Roman Catholic prelate (b. Piacenza, It., Aug. 27, 1872—d. Bologna, It., March 13, 1952), was ordained in 1895. He became a canon of Santa Maria Maggiore, Rome, in 1899, was bishop of Gubbio from 1907 to 1916 and titular archbishop of Thebes and private chaplain to Pope Benedict XV from 1916. In 1920 he was appointed assistant ecclesiastical general of Catholic Action. He became archbishop of Bologna in 1921 and was elevated to the Sacred College of Cardinals in 1923.

Jeff, Pat Morris, U.S. politician and educator (b. McGregor, Tex., Nov. 26, 1871—d. Waco, Tex., Jan. 20, 1952).

Neumann, Alfred, German-U.S. author (b. Lautenberg, Ger., Oct. 15, 1895—d. Lugano, Switz., Oct. 3, 1952), the son of a Jewish timber merchant, was educated at Munich, Ger. He published his first work, a volume of verse, in 1917, after which he taught drama in Munich. Following several years of dire poverty he wrote a play, *The Patriot* (Eng. trans. 1928), *King Haber*, and *Other Stories* (Eng. trans. 1930) and a long novel, *The Devil* (Eng. trans. 1928), which brought him international fame. *The Devil*, which was later translated into 12 languages and sold several hundred thousand copies, was awarded the Kleist prize for 1926. With the initial anti-Semitic laws of Adolf Hitler, Neumann moved to Italy and later to France; in 1942 he went to the United States and became a U.S. citizen. Other works by Neumann, with the date of publication in English, include *The Rebels* (1929), *The Hero* (1931), *Another Caesar* (1935), *Gaudy Empire* (1937) and *Six of Them* (1945). *The Patriot* was produced in more than 500 theatres in Europe and America; another Neumann play, based on Leo Tolstoy's *War and Peace* and so named, appeared in New York city in 1942.

Nicholson, Leonard Kimball, U.S. newspaper publisher (b. New Orleans, La., Jan. 11, 1881—d. New Orleans, Oct. 19, 1952).

Niles, David K., U.S. presidential adviser (b. Boston, Mass., 1890?—d. Boston, Sept. 28, 1952), the son of Russian immigrants, went to work in a department store after finishing his high school education. During World War I he worked in the U.S. department of labour at Washington, D.C., and in 1921 became associate director of the Ford Hall forum in Boston. There he became associated with Robert M. La Follette, Sr., and was chairman of the latter's speakers' bureau during his campaign for the presidency on the Progressive party ticket in 1924. A specialist in U.S. political and racial minorities, Niles took an active part in the Sacco-Vanzetti case of the 1920s and in 1928 headed an independent voters' group for Alfred E. Smith. In 1935 he became an assistant to Harry L. Hopkins in the Works Progress administration and subsequently became a confidential adviser to Pres. Franklin D. Roosevelt. He served in a like capacity for Pres. Harry S. Truman until his retirement in May 1951. Niles was considered to be one of the most influential figures in both the New Deal and Fair Deal administrations and was believed to have played a major role in the U.S. backing of independence for Israel.

Norris, James, Sr., U.S. businessman and sports promoter (b. Montreal, Que., Dec. 10, 1878—d. Chicago, Ill., Dec. 4, 1952).

Nyggaardsvold, Johan, Norwegian government official (b. Hommelvik, Nor., Sept. 6, 1879—d. Trondheim, Nor., March 13, 1952), after working for six years on railway construction in the U.S., returned to Norway in 1907 and engaged in politics. Elected to the *storting* as a labour member in 1916, he was speaker in 1928 and again in 1934-35. In 1928 he was appointed minister of agriculture in the first Labour cabinet, which lasted 18 days. On March 16, 1935, he formed the second Labour cabinet. In June 1940 after the German invasion, he sailed for Great Britain and headed the Norwegian government-in-exile in London. During World War II he maintained his reputation for courage and conscientiousness. After the liberation he relinquished his premiership on June 25, 1945, and retired.

Okada, Keisuke, Japanese statesman and naval officer (b. Fukui prefecture, Japan, Jan. 1868—d. Tokyo, Japan, Oct. 17, 1952).

Orlando, Vittorio Emanuele, Italian lawyer and statesman (b. Palermo, Sic., May 19, 1860—d. Rome, It., Dec. 1, 1952), was prime minister of Italy, 1917-19, and led the Italian delegation to the Paris peace conference in 1919. He resigned from parliament and retired from public life in Aug. 1925 after the fascist victory in the Palermo municipal elections. (For his early career see *Encyclopedia Britannica*.) After the liberation of Rome in World War II Orlando resumed public life and was president of the chamber of deputies, 1944-46. He resigned from the constituent assembly in 1947 in protest against the signing of the Italian peace treaty and three years later, in the senate, he fiercely attacked Italian foreign policy, which was abhorrent to his fervent nationalist sentiments.

Orton, William Aylott, British-born U.S. economist and author (b. Bromley, Eng., Feb. 9, 1889—d. Damariscotta, Me., Aug. 13, 1952).

Oskison, Mrs. Hildegard Hawthorne, U.S. author (b. New York, N.Y., 1871?—d. Danbury, Conn., Dec. 10, 1952).

Oursler, (Charles) Fulton, U.S. author and editor (b. Baltimore, Md., Jan. 22, 1893—d. New York, N.Y., May 24, 1952), attended public schools in Baltimore and joined the *Baltimore American* in 1910 as a reporter. From 1912 to 1918 he was drama and music critic for that paper. After two years as managing editor of a New York music publication, he became editor-in-chief of the *Metropolitan* magazine in 1923. He was also editor of *Liberty* magazine from 1931 to 1942, and senior editor of the *Reader's Digest* from 1944 until his death. As early as 1923 Oursler had begun to write fiction and plays. His mystery stories had a wide popularity, but none to compare with his best-selling book, *The Greatest Story Ever Told*, a popular life of Christ published in 1949 and syndicated in a number of U.S. newspapers. Oursler, a convert to Roman Catholicism, also wrote several other books on religious subjects, including *Why I Know There is a God* (1950), under the pseudonym Anthony Abbot.

Page, Leigh, U.S. physicist and author (b. South Orange, N.J., Oct. 13, 1884—d. New Haven, Conn., Sept. 14, 1952).

Palavicini, Felix Fulgencio, Mexican historian and diplomat (b. Teapa, Tabasco, Mex., March 31, 1881—d. Mexico City, Mex., Feb. 10, 1952).

Palin, Septer Faith ("SEP"), U.S. harness racing driver (b. Rushville, Ind., April 11, 1876—d. Lexington, Ky., Sept. 29, 1952).

Palmer, Joe H., U.S. newspaperman, educator and author (b. Lexington, Ky., Oct. 18, 1904—d. Malverne, N.Y., Oct. 31, 1952).

Paltsits, Victor Hugo, U.S. librarian and historian (b. New York, N.Y., July 12, 1867—d. Jamaica, L.I., N.Y., Oct. 3, 1952).

Patterson, Paul Chenery, U.S. newspaper publisher (b. Jacksonville, Ill., Nov. 18, 1878—d. Baltimore, Md., April 21, 1952), studied at The University of Chicago before joining the *Chicago Tribune* as a reporter in 1899. He was city editor of three other Chicago newspapers before moving in 1906 to Washington, D.C., where he later became general manager of the *Washington Times*. In 1911 Patterson was appointed managing editor of the *Baltimore Evening Sun*, advancing after World War I to the presidency of the Sun-papers and the presidency of the parent publishing organization, A. S. Abell company.

Patterson, Robert Porter, former U.S. secretary of war (b. Glens Falls, N.Y., Feb. 12, 1891—d. Elizabeth, N.J., Jan. 22, 1952), received his bachelor's degree from Union college, Schenectady, N.Y., in 1912 and his law degree from Harvard university in 1915. Admitted to the bar in the latter year, he joined the New York city law firm of Elihu Root. He saw service on the Mexican border in 1916 and during World War I was an officer with the 306th infantry division in France, winning the silver star and the distinguished service cross for heroism in combat. He again practised law from 1919 to 1930, when Pres. Herbert Hoover appointed him judge of the U.S. district court for the southern New York district. In 1939 he was appointed judge of the U.S. circuit court of appeals by Pres. Franklin D. Roosevelt. In July of the following year he was named assistant secretary of war under Henry L. Stimson, and in Dec. 1940 undersecretary of war. In this post Patterson directed the army's supply procurement program.

Upon Stimson's retirement in 1945, Pres. Harry S. Truman named Patterson secretary of war. In the cabinet and elsewhere Patterson worked energetically to unify the U.S. armed forces and to secure adoption of universal military training. President Truman awarded him the distinguished service medal and cited him as one "whose contributions to victory (in World War II) cannot be overestimated." After his retirement July 24, 1947, Patterson again returned to private law practice in New York city. He was killed in the crash of an airliner attempting to land at Newark (N.J.) airport.

Pearson, John Magnus, U.S. physicist and author (b. Portland, Ore., July 9, 1904—d. Swarthmore, Pa., Nov. 16, 1952).

Peers, Edgar Allison, British Hispanic scholar (b. Leighton Buzzard, Bedfordshire, Eng., May 7, 1891—d. Liverpool, Eng., Dec. 21, 1952), was educated at Dartford Grammar school and at Christ's college, Cambridge. After working as modern languages master at Mill Hill and Felsted schools and Wellington college, he was appointed to the Gilmour chair of Spanish in the University of Liverpool in 1920. Attracted to the romantic aspects of English and French literature, he soon came under the spell of Spanish mysticism. He published his first Spanish study in 1923 (*Rivas and Romanticism in Spain*) and a stream of scholarly works quickly followed, establishing his reputation as an authority on Spanish thought. He translated the work of such prominent Spanish thinkers as St. John of the Cross and St. Theresa of Avila. He published numerous books on Spanish politics (*The Spanish Tragedy, 1930-1936, 1936; The Spanish Dilemma, 1940*), some travel books on Spain and, was a contributor to the *Encyclopedia Britannica*. Under the pseudonym of Bruce Truscot, Peers wrote several books pleading for a recognition of the potentialities of the modern ("red-brick") universities.

Pekkala, Mauno, Finnish government official (b. Sysma, Fin., Jan. 27, 1890—d. Helsinki, Fin., June 30, 1952), son of a lumberjack, studied at the University of Helsinki and at 31 received a Ph.D. degree. He joined the forest administration board and in 1933 became its deputy director. He was politically active among the small farmers and from 1927 was the chairman of their union. From that year, too, he was a member of parliament. Four times a minister, he served as prime minister from March 24, 1946, to July 22, 1948. He was supported by the communist-controlled S.K.D.L. (Finnish People's Democratic league). On April 6, 1948, he signed in Moscow the Soviet-Finnish treaty of mutual aid. At the Feb. 15, 1950, presidential election, he was the S.K.D.L. candidate against J. K. Paasikivi, but was defeated.

Perlman, Nathan David, U.S. jurist (b. Prusice, Pol., Aug. 2, 1887—d. New York, N.Y., June 29, 1952).

Perón, María Eva Duarte de, Argentine political leader and wife of President Juan D. Perón (b. Los Toldos, Arg., May 7, 1919—d. Buenos Aires, Arg., July 26, 1952), attended high school for two years and then went to Buenos Aires, where she became a successful radio and motion picture actress. In 1943 she met Juan Domingo Perón, then an under-secretary in the war ministry, and helped organize a radio workers' union under his sponsorship. They were married in Oct. 1945, and four months later Perón was elected president of Argentina. In 1947 she founded the María Eva Duarte de Perón Welfare foundation, which administered a huge program of social welfare and personal largesse. Through this organization and through her leadership in national labour groups and the so-called "descamisados"

(literally "shirtless ones," of the lower classes), she wielded an unparalleled political influence in Argentina on behalf of her husband, whom she termed "God for us—our sun, our air, our water, our life." She was the Peronist party's candidate for vice-president of Argentina in 1951 but withdrew because of illness and because of opposition from certain army groups. Three months later, in Nov. 1951, she was operated upon (apparently for cancer) and thereafter gradually lost physical strength. Her last public appearance was on June 4, 1952, at her husband's inauguration for his second term as president. Her death touched off great demonstrations of mourning in Argentina.

Perry, John Holliday, Sr., U.S. newspaper publisher (b. Port Royal, Ky., March 3, 1881—d. West Palm Beach, Fla., Dec. 4, 1952).

Perry, John Lester, U.S. industrialist (b. Worcester, Mass., March 11, 1881—d. Pittsburgh, Pa., May 27, 1952), attended the public schools of Worcester, Mass., and began his career with a steel company after graduation from high school. He later became president of three U.S. Steel corporation subsidiaries, including Carnegie-Illinois Steel Corporation (1938-46).

Peters, Susan (SUZANNE CARNAHAN), U.S. actress (b. Spokane, Wash., July 3, 1921—d. Visalia, Calif., Oct. 23, 1952), attended Max Reinhardt's School of Dramatic Art in Hollywood, Calif., and first attracted national attention as a motion-picture actress for her role in *Random Harvest* (1942). She was named one of the "stars of tomorrow" for 1943, and a number of starring roles followed until, on Jan. 1, 1945, she was injured in a hunting accident and paralyzed for life. Nevertheless, she continued to act in motion pictures and television and on the stage, playing the parts of invalids. In 1951 she took the leading role in a television show, "Miss Susan," written especially for her and concerning the life of a crippled woman attorney.

Pierson, Delavan Leonard, U.S. religious author, teacher and editor (b. Waterford, N.Y., Oct. 27, 1867—d. Clifton, N.J., Nov. 5, 1952).

Piñero, Jesús Toribio, Puerto Rican government official (b. Carolina, P.R., April 16, 1897—d. Canovanas, P.R., Nov. 19, 1952), studied at the University of Puerto Rico, Rio Piedras, and at the University of Pennsylvania, Philadelphia. He was elected chairman of the municipal assembly of his native town in 1928 and a member of the Puerto Rican house of representatives in 1940. In 1938 he had helped found the Popular Democratic party, which dominated Puerto Rican politics after 1940. From 1944 to 1946 he was the Puerto Rican resident commissioner at Washington, D.C., and on July 25, 1946, Pres. Harry S. Truman appointed him the first native-born governor of the island.

Pinkas, David Zvi, Israeli politician (b. Sopron, Hung., Dec. 6, 1895—d. Jerusalem, Israel, Aug. 14, 1952).

Poole, DeWitt Clinton, U.S. diplomat and educator (b. near Vancouver, Wash., Oct. 28, 1885—d. Princeton, N.J., Sept. 3, 1952).

Poptomov, Vladimir Tomov, Bulgarian diplomat (b. Belitza, Macedonia, 1890—d. Sofia, Bulg., May 2, 1952).

Preble, Madge Collar (MRS. ROBERT PREBLE), U.S. civic worker (b. Monroe, La., Nov. 18, 1904—d. Chicago, Ill., Nov. 30, 1952).

Price, William Jennings, U.S. diplomat and educator (b. Lancaster, Ky., Dec. 15, 1873—d. Washington, D.C., May 20, 1952).

Prosser, Charles Allen, U.S. educator (b. New Albany, Ind., Sept. 20, 1871—d. Minneapolis, Minn., Nov. 26, 1952).

Pucci, Enrico, Italian Roman Catholic prelate and journalist (d. Vatican City, State, Sept. 5, 1952).

Quijano, Juan Hortensio, Argentine statesman (b. Curuzú-Cuatiá, Arg., June 1, 1884—d. Buenos Aires, Arg., April 3, 1952).

Quo Tai-chi, Chinese diplomat (b. Kwang-tsi, China, 1888—d. Santa Barbara, Calif., Feb. 29, 1952), was educated privately in China, went as a youth to the United States, and received a B.S. degree from the University of Pennsylvania, Philadelphia, in 1911. Returning to China, he became secretary and counsellor to Sun Yat-sen, and in 1923-24 was vice-minister of foreign affairs in the Cantonese government. In 1932 he was chief Chinese delegate at the armistice negotiations in Shanghai for withdrawal of Japanese troops from China, and in the following two years was a delegate to the League of Nations. He was appointed first Chinese ambassador to Great Britain in 1935 and in 1941 became foreign minister under Chiang Kai-shek. He was chairman of the United Nations Security council's first meeting in New York city in 1946.

Radford, Basil, British actor (b. Chester, Eng., June 25, 1897—d. London, Eng., Oct. 20, 1952).

Rawson, Arturo, Argentine army officer and political leader (b. Santiago del Estero, Arg., June 4, 1885—d. Buenos Aires, Arg., Oct. 8, 1952), received his education at the Argentine military college in 1902-05; he was commis-

1952 OBITUARIES: María Eva Duarte de Perón, Argentine political leader; George Santayana, Spanish-born philosopher; Kurt Schumacher, German political leader; Count Carlo Sforza, Italian diplomat; Chaim Weizmann, Israeli statesman

tioned second lieutenant in 1907 and subsequently advanced to the rank of divisional general (1943). In mid-1943 he headed a group of army officers who succeeded in overthrowing the conservative government of Pres. Ramón S. Castillo. Rawson was proclaimed president but held the office for only two days (June 5-7) before yielding in turn to Gen. Pedro Ramírez, his coleader in the revolution. Behind both officers, however, and wielding the true power, was Juan D. Perón, who thus was launched on his way to dictatorial power in Argentina. Rawson later turned against Perón and was twice arrested for alleged plotting against the Peronista regime, the last time in Sept. 1951.

Maymond, Percy Edward, U.S. palaeontologist (b. New Canaan, Conn., May 30, 1879—d. Cambridge, Mass., May 17, 1952).

Meilly, Peter C., U.S. industrialist and philanthropist (d. Indianapolis, Ind., Jan. 4, 1952).

Restrepo, Gonzalo, Colombian diplomat and government official (b. Manizales, Caldas, Colombia, Oct. 22, 1897—d. Bogotá, Colombia, June 22, 1952).

Reyes, Gabriel M., first Philippine Roman Catholic archbishop (b. Kalibo, P.I.—d. Washington, D.C., Oct. 10, 1952).

Rice, Thurman Brooks, U.S. public health authority (b. Landess, Ind., Aug. 17, 1888—d. Indianapolis, Ind., Dec. 27, 1952).

ricketson, Oliver Garrison, U.S. explorer and authority on Mayan culture (b. Pittsburgh, Pa., Sept. 19, 1894—d. New Bedford, Mass., Oct. 17, 1952).

riggs, Arthur Stanley, U.S. author and editor (b. Cranford, N.J., April 8, 1879—d. Washington, D.C., Nov. 8, 1952).

rightmire, George Washington, U.S. educator (b. Center Furnace, O., Nov. 15, 1868—d. Columbus, O., Dec. 23, 1952). studied at Ohio State university, Columbus, where in 1902 he joined the faculty of the law school. He became full professor of law in 1906, at the same time carrying on an active practice, dealing especially with patent, copyright and trademark cases. He was elected president of Ohio State in 1926, and retired in 1938.

imini, Giacomo, U.S. opera singer (b. Verona, It., March ?, 1888—d. Chicago, Ill., March 6, 1952).

ivetta, Count Pietro Silvio (TODDI), Italian author (b. Rome, It., July 8, 1886—d. Rome, July 1?, 1952).

Robinson, Boardman, U.S. artist (b. Somerset, N.S., Sept. 6, 1876—d. Stamford, Conn., Sept. 5, 1952). studied art as a youth at the Massachusetts Normal Art school in Boston, Mass., and at the Académie Colarossi and the Ecole des Beaux Arts in Paris, Fr. After trying vainly to earn a living as an artist in San Francisco, Calif., he moved to New York city, where from 1907 to 1910 he was a cartoonist for the *New York Morning Telegraph* and from 1910 to 1914 for the *New York Tribune*. In 1915 he toured Russia and the Balkans with the radical author, John Reed, on illustration assignments for the *Metropolitan* magazine; later he did work for *The Liberator*, *Harper's Weekly*, *The Masses* and the *Outlook* (London). In the 1920s his interest shifted to mural painting, and he did murals for the RKO building in Rockefeller centre, New York city, the Department of Justice building in Washington, D.C., and other structures. He was also noted as a book illustrator. Until 1947 Robinson was director of the Colorado Springs (Colo.) Fine Arts centre.

Robinson, Louis Newton, U.S. penologist and economist (b. Tunkhannock, Pa., Nov. 3, 1880—d. Media, Pa., Nov. 25, 1952).

Robison, Samuel Shelburne, U.S. naval officer (b. near Mifflintown, Pa., May 10, 1867—d. Glendale, Calif., Nov. 20, 1952).

Roland Holst, Henriette (HENRIETTE VAN DER SCHALK), Dutch poet and Socialist leader (b. Noordwijk, Neth., 1869—d. Amsterdam, Neth., Nov. 21, 1952).

Romero, José Rubén, Mexican author and diplomat (b. Cotija, Michoacán, Mex., Sept. 25, 1890—d. Mexico City, Mex., July 4, 1952).

Rosenbach, Abraham S. Wolf, U.S. bibliophile and collector (b. Philadelphia, Pa., July 22, 1876—d. Philadelphia, July 1, 1952).

Rostovtzeff, Michael Ivanovich, Russian classical scholar (b. Kiev, Russia, Nov. 10, 1870—d. New Haven, Conn., Oct. 20, 1952). was educated at the First Classical gymnasium, Kiev, at the University of Kiev and at the University of St. Petersburg. A three-year grant enabled him to study ancient history abroad, 1895-98, and at this time he acquired his lifelong interest in archaeological studies. He was professor of Latin at St. Petersburg university from 1898 to 1918 when he had to leave Russia because of the Bolshevik revolution; he then studied English at Oxford until 1920. He was professor of ancient history at the University of Wisconsin, Madison, 1920-25, and Sterling professor of ancient history and classical archaeology, Yale university, 1925-44 (later professor emeritus). He headed the Yale Dura-Europos expedition to Syria, 1928-38, and was director of Dura-Europos research, Yale, from 1944 until his death. His published works include *Iranians and Greeks in South Russia* (1922), *The Social and Economic History of the Roman Empire* (1926), *The Animal Style in South Russia and China* (1929), *Out of the Past of Greece and Rome* (1932) and *The Social and Economic History of the Hellenistic World* (1941).

Rubinstein, Beryl, U.S. pianist and composer (b. Athens, Ga., Oct. 26, 1898—d. Cleveland, O., Dec. 29, 1952).

Rubstov, Boris, Russian historian (d. Moscow, U.S.S.R., June 28?, 1952).

Sabath, Adolph Joachim, U.S. congressman (b. Zabori, Bohemia, April 4, 1866—d. Bethesda, Md., Nov. 6, 1952). emigrated to the United States in 1881, settling in Chicago and becoming a naturalized U.S. citizen at the age

of 21. After taking his law degree at Lake Forest (Ill.) university in 1891 he began law practice and in 1895 became justice of the peace in Chicago; in 1897 he was elected police magistrate, serving until 1907. In 1906 he was first elected to the U.S. house of representatives as a Democrat from the 5th (later 7th) Illinois district. Taking office in 1907, he served in the house continuously thereafter until his death, establishing a new record of consecutive service by a congressman; he was re-elected for his 24th term in 1952.

Sabath supported without exception every legislative measure sponsored by the administration of Franklin D. Roosevelt; he continued his undeviating party loyalty under the Harry S. Truman administration until July 1946, when he opposed a U.S. loan to Great Britain. Subsequently, however, as dean of the house of representatives, he returned to the Fair Deal fold.

Salter, William Thomas, U.S. pharmacologist (b. Boston, Mass., Dec. 19, 1901—d. New Haven, Conn., July 30, 1952).

Sanabria y Martínez, Victor Manuel, Costa Rican Roman Catholic prelate and historian (b. San Rafael de Oreamuno, Costa Rica, Jan. 17, 1899—d. San José, Costa Rica, June 8, 1952).

Santayana, George (JORGE AGUSTIN NICOLAS DE SANTAYANA), Spanish-born philosopher and man of letters (b. Madrid, Sp., Dec. 16, 1863—d. Rome, It., Sept. 26, 1952). moved to Boston, Mass. as a boy and graduated from Harvard university in 1886. A teacher at Harvard for 23 years, Santayana had resided in Europe since his retirement in 1912. For an account of his philosophy, see *Encyclopaedia Britannica*.

As a modern Platonist whose philosophy was set in an aesthetic context, he had contributed significantly to the development in America of a realistic metaphysics and theory of knowledge. He was a keen and somewhat disinterested observer of contemporary culture and was widely read as critic and analyst of the entire gamut of life from religion to politics. A master of literary form, Santayana as essayist and novelist as well as technical philosopher charmed three generations of readers with his brilliant prose.

Schmidt, Petrus Johannes, Dutch editor, secretary of U.N. Disarmament committee (b. Arnhem, Neth., Nov. 23, 1896—d. Jamaica, N.Y., Dec. 2, 1952).

Schroeder, Rudolph William ("SHORTY"), U.S. aviation pioneer (b. Chicago, Ill., Aug. 14, 1886—d. Chicago, Dec. 29, 1952). was one of the earliest U.S. pilots, learning to fly in 1910 and taking part thereafter in numerous barnstorming tours and establishing many new flight records. He was the first man to fly into the earth's stratosphere, setting an altitude mark of 38,100 ft. in 1920. Subsequently he was an executive or technical adviser of a number of aviation and air-line companies. From 1916 to 1920 he served in the U.S. army air corps, attaining the rank of major.

Schumacher, Kurt, German politician (b. Kulm, West Prussia [now Chelmno, Pol.], Oct. 13, 1895—d. Bonn, Ger., Aug. 20, 1952). was the son of a merchant and was educated at Halle, Leipzig, Berlin and Münster universities. After serving in World War I in which he lost his right arm, he became in 1920 political editor of the social democratic *Schwäbische Tagwacht*. He occupied a state legislative seat in the Württemberg diet, 1924-31, and was a member of the *Reichstag*, 1930-33. During the 1920s he had attacked extremists of the left and right, particularly the financial backers of the growing Nazi party. After the nazis had come to power in 1933, Schumacher was arrested and spent the next ten years in concentration camps. Released between March and August 1943 and again in Feb. 1944 he was rearrested after the plot against Hitler on July 20, 1944. He began to reorganize the Social Democratic party (*Sozialdemokratische Partei Deutschlands*) after the German defeat, and in Oct. 1945 at Hanover he was chairman of its first open meeting in 12 years. In May 1946 he became chairman of the S.P.D. for the three western zones. He sought to broaden the base of his party by appealing to the middle class and the religious, and in the Berlin elections of 1947 the S.P.D. emerged with a higher vote than ever before. His refusal to compromise with the Communists, on the other hand, resulted in constant attacks from the Soviet zone. A long illness, culminating in 1948 in the amputation of his left leg, further weakened his attenuated health, and he became increasingly bitter toward his political opponents. In 1949 he became leader of the opposition in the *bundesstag* and thereafter he consistently opposed the Schuman plan, the customs union between France and the Saar and, later, German rearmament and the Bonn contractual agreements. In many ways a heroic figure, Schumacher became fanatical in his desire for a reunited, socialist, democratic Germany, a concept which seemed to many like a revival of nationalism.

Schumann, Elisabeth, German singer (b. Merseburg, Ger., June 13, 1888—d. New York, N.Y., April 23, 1952).

Scotto, Vincent, French composer and song writer (b. Marseilles, Fr., 1876—d. Paris, Fr., Nov. 15, 1952).

Scribner, Charles, U.S. publisher (b. New York, N.Y., Jan. 26, 1890—d. New York, Feb. 11, 1952).

Scripps, William Edmund, U.S. publisher (b. Detroit, Mich., May 6, 1882—d. near Lake Orion, Mich., June 12, 1952).

Senanayake, Don Stephen, Ceylon prime minister (b. Oct. 20, 1884—d. Colombo, Ceylon, March 22, 1952). was educated at St. Thomas college, Mount Lavinia, Ceylon. A planter by profession he entered politics in 1924 when he succeeded his brother on the legislative council. From 1931 to 1947 he was minister of agriculture and lands and from 1942 to 1947 he was also leader of the state council and vice-chairman of the board of ministers. On Sept. 26, 1947, he formed a government which was handed full dominion status within the Commonwealth of Nations on Feb. 4, 1948. In addition to the premiership he held the portfolios of defense and external affairs. He attended meetings of commonwealth prime ministers in London in 1948, 1949 and 1951, and in Jan. 1950 presided over the first meeting of commonwealth foreign ministers to be held in Colombo. In Oct. 1951 he visited Australia and New Zealand. On March 21, 1952, he was thrown from his horse, and he died the following day.

Sensenbrenner, Frank Jacob, U.S. manufacturer (b. Menasha, Wis., Dec. 23, 1864—d. Neenah, Wis., July 22, 1952).

Serafini, Camillo Marchese, governor of Vatican City (b. Rome, It., 1863?—d. Vatican City State, March 21, 1952).

Sforza, Count Carlo, Italian statesman (b. Montignoso di Lunigiana, Liguria, It., Sept. 25, 1873—d. Rome, It., Sept. 4, 1952), entered the diplomatic service in 1896 and served in Cairo, Paris, Constantinople, Peking, Bucharest, Madrid and London. In 1908–09 he was *chargé d'affaires* in Istanbul. He was *chef de cabinet* to the Marquis di San Giuliano, the foreign minister, 1910–11; minister to China, 1911–15, and minister to Serbia, 1915–18. In Nov. 1918 he returned to Istanbul as high commissioner for Italy. He was undersecretary of state for foreign affairs, 1919–20, and minister for foreign affairs, 1920–21. Appointed ambassador to France in Feb. 1922, he resigned nine months later, refusing to serve under Benito Mussolini. For nearly two decades Sforza lived abroad—in Belgium until 1939 and in the United States after 1940—as lecturer and political commentator. He returned to Italy in 1943. He was minister without portfolio in the cabinets of Pietro Badoglio, April–June 1944, and Ivanoe Bonomi, June–Nov. 1944, high commissioner for *epurazione*, June 1944–Jan. 1945, and president of the consultative assembly, Sept. 1945–May 1946. Elected a member of the constituent assembly as a Republican, 1946, he joined the third Alcide De Gasperi cabinet in 1947 as minister of foreign affairs, retaining this position until July 1951 when he resigned because of ill-health. Sforza's influence was a determining factor in the Italian ratification of the peace treaty, in Italy's joining the Organization for European Economic Cooperation and in its adherence to the North Atlantic treaty, which he signed for Italy in Washington, D.C., April 4, 1949. His published works in English include *Makers of Modern Europe* (1930), *European Dictatorships* (1931) and *The Real Italians* (1942).

Sherman, Harry, U.S. motion-picture producer (b. Boston, Mass., Nov. 4, 1884—d. Hollywood, Calif., Sept. 25, 1952).

Sherrington, Sir Charles Scott, British physiologist (b. London, Eng., Nov. 27, 1857—d. Eastbourne, Sussex, Eng., March 4, 1952), was educated at Ipswich Grammar school, Gonville and Caius college, Cambridge, and St. Thomas' hospital medical school, London. In 1891 he became Brown professor of pathology, University of London, and professor-superintendent of the Brown Animal Sanatory institution. In 1895 he was appointed Holt professor of physiology, University of Liverpool. He was elected an honorary fellow of Caius in 1899. From 1913 to 1936 he was Waynflete professor of physiology, Oxford university, and a fellow of Magdalen college. He also held the Fullerian chair of physiology at the Royal institution, London, 1914–17. Elected a fellow of the Royal society in 1893, he was its president in 1920 and president of the British association in 1922. His most important contributions were on the mechanism of the nervous system, and his book *The Integrative Action of the Nervous System* (Silliman lectures, Yale, 1904, reprinted, 1947) was recognized as a standard work. In 1932 he was awarded the Nobel prize for medicine jointly with Professor E. D. Adrian.

Shientag, Bernard Lloyd, U.S. jurist (b. New York, N.Y., April 13, 1887—d. New York, May 23, 1952).

Short, Joseph Hudson, Jr. ("Joe"), U.S. presidential secretary (b. Vicksburg, Miss., Feb. 11, 1904—d. Alexandria, Va., Sept. 18, 1952), received his bachelor's degree from Virginia Military institute, Lexington, Va., in 1925 and began his journalistic career as a reporter for the *Jackson* (Miss.) *Daily News* the same year. He later worked for the *Vicksburg Post and Herald*, the *New Orleans Times-Picayune*, the *Chicago Sun* (later *Sun-Times*) and the *Baltimore Sun*. With the latter paper he was Washington correspondent from 1943 until his appointment in 1950 as press secretary to Pres. Harry S. Truman. In 1948 he was president of the National Press club in Washington.

Sidgwick, Nevil Vincent, British chemist (b. Oxford, Eng., May 8, 1873—d. Oxford, March 15, 1952).

Sill, Frederick Herbert, U.S. educator and Episcopalian clergyman (b. New York, N.Y., March 10, 1874—d. Kent, Conn., July 17, 1952).

Skipworth, Alison, British-born U.S. actress (b. London, Eng., July 25, 1863—d. New York, N.Y., July 5, 1952).

Slansky, Rudolf Salzmann, Czechoslovak politician (b. Nezvestice, Bohemia, July 31, 1901—d. Prague, Czechoslovakia, Dec. 3, 1952), became editor of *Rude Pravo*, organ of the Czechoslovak Communist party, and Communist party secretary in Moravska-Ostrava in 1924. He was elected a member of the central and executive committees of the party in 1928 and was its secretary-general from 1945. A member of the Czechoslovak national assembly, 1935–37, he flew to the U.S.S.R. after the Munich agreement of 1938 and worked among Czech groups there, becoming a member of the partisan general headquarters, Kiev, in 1944. He was leader of the partisan movement in Slovakia from 1944 to 1945 when he re-entered parliament and became chairman of the defense committee of the national assembly. In Sept. 1947 he was a delegate to the foundation conference of the Cominform, held in Wilczagora, Lower Silesia. In Nov. 1951, shortly after being "promoted" to vice-premier, he was arrested on a charge of being the ringleader of a Jewish plot to overthrow Communism in Czechoslovakia. In Nov. 1952 Slansky, with ten others, including Vladimir Clementis, was sentenced to death by a People's court in Prague. He was hanged on Dec. 3.

Smart, David A., U.S. magazine publisher (b. Omaha, Neb., Oct. 4, 1892—d. Chicago, Ill., Oct. 16, 1952), went to work as an advertising salesman for the *Chicago Tribune* in 1911. In 1921 he founded his own publishing company, which in 1933 introduced *Esquire*, a magazine for men which became an immediate publishing success. In 1936 he founded *Coronet*, a pocket-size magazine carrying no advertising and featuring fine photographs and articles of general interest; it too was a success. Still another venture was *Ken*, whose publication was, however, suspended.

Smith, Barry Congar, U.S. welfare leader (b. Pittsburgh, Pa., June 28, 1877—d. New York, N.Y., March 31, 1952).

Smith, Ida B. Wise, U.S. temperance leader (b. Philadelphia, Pa., July 3, 1871—d. Clarinda, Ia., Feb. 16, 1952), was president of the Woman's Christian Temperance union from 1933 to 1944. She taught school for a number of years and ran a store at Hamburg, Ia., meanwhile becoming interested in the movement for prohibition. She was elected president of the Iowa state W.C.T.U. in 1913, and her fight against liquor continued for the rest of her life.

Soskin, William, U.S. editor, publisher and critic (b. New York, N.Y., May 1, 1899—d. St. Petersburg, Fla., March 24, 1952).

Spencer, Niles, U.S. artist (b. Pawtucket, R.I., May 16, 1893—d. Dingman's Ferry, Pa., May 15, 1952).

Spicer, William Ambrose, U.S. author, clergyman and pioneer leader of Seventh Day Adventist Church (b. Freeborn, Minn., Dec. 15, 1865—d. Tacoma Park, Md., Oct. 17, 1952).

Stahlberg, Kaarlo Juho, Finnish statesman and first president of Finland (b. Jan. 28, 1865—d. Helsinki, Fin., Sept. 22, 1952).

Stauffer, Donald Alfred, U.S. author and professor (b. Denver, Colo., July 4, 1902—d. Oxford, Eng., Aug. 8, 1952).

Steeruwitz, Ernst, Austrian industrial engineer and politician (b. Mies, Bohemia, 1878—d. Vienna, Aus., Oct. 19, 1952).

Stillman, Charles Clark, U.S. educator and social worker (b. Troy, N.Y., June 22, 1877—d. Columbus, O., Jan. 5, 1952).

Stimpson, George William, U.S. journalist and author (b. near Anamosa, Ia., Nov. 3, 1896—d. Washington, D.C., Sept. 27, 1952).

Stratford, James, former chief justice of the Union of South Africa (b. The Dene, Port Elizabeth, U. of S. Af., July 19, 1869—d. Capetown, U. of S. Af., Jan. 17, 1952).

Strong, Austin, U.S. dramatist (b. San Francisco, Calif., April 18, 1881—d. Nantucket, Mass., Sept. 17, 1952), a grand-stepson of Robert Louis Stevenson, studied at Wellington college, N.Z., and after a brief career as a landscape architect became a playwright. His first play, *The Exile* (1903), was written in collaboration with his uncle, Lloyd Osbourne, who had also collaborated with Robert Louis Stevenson. Strong's *Three Wise Fools*, first produced in New York city in 1918, was revived in 1936 with William Gillette as the star. His *Seventh Heaven* (1922) was one of the great theatrical successes of the 1920s in the U.S., running for 704 performances on Broadway. Other plays by Strong included *The Little Father of the Wilderness* (with Lloyd Osbourne, 1905), *The Drums of Oude* (1906), *The Toymaker of Nuremberg* (1907), a version of *Rip Van Winkle* (1911), *Bunny* (1916) and *A Play Without a Name* (1928).

Sturtevant, Edgar Howard, U.S. philologist (b. Jacksonville, Ill., March 7, 1875—d. Branford, Conn., July 1, 1952).

Sullivan, Mark, U.S. author and newspaperman (b. Avondale, Pa., Sept. 10, 1874—d. West Chester, Pa., Aug. 13, 1952), took his bachelor's degree at Harvard in 1900 and his LL.B. there in 1903. After less than a year of law practice in New York city, he joined the *Ladies' Home Journal* as a staff writer. In 1906 he was named Washington correspondent of *Collier's Weekly* and in Jan. 1914 he became editor of that magazine. Unsympathetic toward Pres. Woodrow Wilson's administration during World War I, he opposed U.S. entry into the League of Nations. In 1919 he left *Collier's* to become a correspondent for the *New York Evening Post* and four years later joined the *New York Tribune* (which became the *Herald-Tribune* in 1924). There his political column drew a national readership and was syndicated in approximately 100 newspapers; he continued to write it until his death. A close friend of Pres. Herbert C. Hoover, Sullivan at first supported Pres. Franklin D. Roosevelt but soon became one of the foremost critics of the New Deal. Sullivan was author of *Our Times*, a 6-vol. history of the United States during the period 1900–25, and of *The Education of an American*, an autobiography (1938).

Swingle, Walter Tennyson, U.S. botanist (b. Canaan, Pa., Jan. 8, 1871—d. Washington, D.C., Jan. 19, 1952).

Szasz, Otto, Hungarian-U.S. mathematician (b. Alsoszuks, Hung., Dec. 11, 1884—d. Switzerland, Sept. 19, 1952), received degrees from the University of Budapest, Hung., and the University of Paris, Fr. After teaching at the University of Frankfurt, Ger., for several years, he went to the United States in 1933 to join the faculty of the Massachusetts Institute of Technology, Cambridge. Later he taught at Brown (Providence, R.I.) and other universities before going to the University of Cincinnati, O., in 1936. Szasz, who became a U.S. citizen in 1940, was an international authority on many aspects of higher mathematics; he published about 100 different papers and was awarded the Koenig prize for mathematics in 1930. He was also associate editor of the *American Journal of Mathematics*.

Taylor, Emily Drayton (MRS. J. MADISON TAYLOR), U.S. miniature painter (b. Philadelphia, Pa., April 14, 1860—d. Philadelphia, June 19, 1952).

Taylor, Montgomery Meigs, U.S. naval officer (b. Washington, D.C., Oct. 13, 1869—d. Bethesda, Md., Oct. 21, 1952).

Taylor, Theodore Cooke, British welfare leader (b. Carlinghow, Batley, Eng., Aug. 3, 1850—d. Grassington, Yorkshire, Eng., Oct. 19, 1952).

Tchernov (Chernov), Victor (VICTOR OLIENIN), Russian revolutionary leader (b. 1876—d. New York, N.Y., April 15, 1952), was a cofounder of the

Russian Social Revolutionary party and its leader for a number of years. A prominent figure in the Russian Revolution of 1917, he was president of the constituent assembly which met Jan. 18, 1918, and was suppressed by the Bolsheviks after a single day's session in Moscow (see his biography in *Encyclopaedia Britannica*). Tchernov went into exile shortly thereafter, moving to Paris in 1938 and to New York city in 1940.

Wheeler, Fred, U.S. baseball player (b. Georgetown, Mass., 1872?—d. Boston, Mass., July 3, 1952).

Wilde, Jean, French author (b. Saint-Junien, Haute-Vienne, Fr., May 9, 1877—d. Paris, Fr., April 9, 1952).

Wolfe, John Martin, U.S. educator (b. Fort Covington, N.Y., Dec. 27, 1869—d. Rutland, Vt., Feb. 26, 1952).

Worthington, Samuel Hunter, U.S. educator and author (b. Tennessee, April 19, 1876—d. Washington, D.C., Oct. 27, 1952).

Worthington, Josef, Austrian sculptor (b. Feb. 7, 1889—d. Feb. 1952).

Wright, Vesta (MATILDA ALICE, LADY DE FRECE), British comedienne (b. Worcester, Eng., May 13, 1864—d. London, Eng., Sept. 16, 1952).

Wright, Richard Montgomery, U.S. banker and diplomat (b. San Francisco, Calif., April 9, 1866—d. San Francisco, Jan. 23, 1952).

Wright, John Andrew, Australian businessman and diplomat (b. Bendigo, Austr., Feb. 3, 1900—d. Canberra, Austr., Dec. 17, 1952).

Wright, Sir Hugh Robert, Irish-born politician (b. Dublin, Ire., May 2, 1877—d. Beckenham, Kent, Eng., Dec. 27, 1952).

Wright, Ernest William, British authority on mediaeval art (b. Carmarthen, Wales, Dec. 27, 1882—d. Haslemere, Surrey, Eng., Jan. 11, 1952).

Trotti, Lamar, U.S. motion-picture scenarist and producer (b. Atlanta, Ga., Oct. 18, 1900—d. Oceanside, Calif., Aug. 28, 1952), received a bachelor's degree at the University of Georgia, Athens, in 1921 and from 1921 to 1925 was a reporter and city editor for the *Atlanta Georgian*. From 1925 to 1932 he was an assistant to Will H. Hays, motion picture "czar," and in the latter year he joined the staff of the Twentieth Century-Fox Film corporation as a producer and scenarist. Among the better known screenplays written by Trotti were *Wilson*, *Cheaper by the Dozen*, *The Razor's Edge*, *The Ox-Bow Incident* and *Young Mr. Lincoln*; he also wrote more than 30 others. For *Wilson*, Trotti was named 1944 Academy award winner, as author of the best original screen play.

Tyndale, Orville Sievwright, Canadian jurist and educator (b. Montreal, Que., June 1887—d. Montreal, Oct. 29, 1952).

Tyson, William David, U.S. Baptist minister and Prohibitionist politician (b. Newman, Ga., Oct. 15, 1866—d. Glendale, Calif., Nov. 21, 1952).

Udall, Homer Bews, U.S. economist and educator (b. Hinsdale, Ill., Dec. 24, 1888—d. Evanston, Ill., July 12, 1952), took his bachelor's and master's degrees from Northwestern university, Evanston, Ill., and his Ph.D. from Harvard university in 1915. From 1915 to 1922 he taught economics at Northwestern, advancing to the rank of professor. He was professor of business economics at Harvard from 1922 to 1929, then vice-president of the Tri-Continental corporation, an investment trust, from 1929 to 1937. He returned to Northwestern as dean of that university's school of commerce (1939-49).

Van Hoosen, Bertha, U.S. surgeon and author (b. Rochester, Mich., March 26, 1863—d. Romeo, Mich., June 7, 1952).

Vaughan, Joseph Floyd ("ARKY"), U.S. baseball player (b. Clifty, Ark., March 9, 1912—d. Eagleville, Calif., Aug. 31, 1952).

Vaughan, Thomas Wayland, U.S. geologist and educator (b. Jonesville, Tex., Sept. 20, 1870—d. Washington, D.C., Jan. 16, 1952).

Vedder, Edward Bright, U.S. physician, discoverer of the cause of beri-beri (b. New York, N.Y., June 28, 1878—d. Washington, D.C., Jan. 30, 1952).

Verduynen, Edgar Michiels van, BARON, Dutch diplomat (b. The Hague, Neth., Dec. 2, 1885—d. London, Eng., May 13, 1952).

Verneuil, Louis, French playwright, actor and producer (b. Paris, Fr., May 14, 1893—d. Paris, Nov. 3, 1952), began his career as a journalist but in 1912 became assistant to the manager of the Théâtre Femina. In 1911-14 he had ten one-act revues produced in Paris. His first three-act comedy was *La Charrrette anglaise* (with Georges Berr, 1916) and he made his debut as an actor in his own *La Jeune fille au bain* (1917). Thereafter he played the lead in almost all his plays, which included *Daniel* (1920), *La Dame en rose* (1921), *La Maison du passeur* (1922) and *Le Fauteuil 47* (1923), and the highly successful *Ma Cousine de Varsovie* (which he wrote for Elvire Popesco, 1923). In 1940 he went to live in the United States where he wrote books on the theatre and numerous film scripts. Verneuil's only English play, *Affairs of State* (1950), ran for more than 600 performances in New York city and was running in London at the time of his death.

Volta, Luigi, Italian astronomer (b. Como, It., July 27, 1876?—d. Milan, It., Oct. 7, 1952).

Wadsworth, James Wolcott, U.S. legislator (b. Genesee, N.Y., Aug. 12, 1877—d. Washington, D.C., June 21, 1952).

Walker, Ernest Linwood, U.S. bacteriologist and educator (b. Freeport, Me., June 24, 1870—d. Atherton, Calif., Jan. 19, 1952).

Wallace, Mrs. David Willock (MADGE GATES), U.S. civic leader and mother-in-law of Harry S. Truman (b. Port Byron, Ill., 1862—d. Washington, D.C., Dec. 5, 1952).

Walsh, Thomas Joseph, U.S. Roman Catholic archbishop (b. Parker's Landing, Pa., Dec. 6, 1873—d. South Orange, N.J., June 6, 1952).

Ward, Fannie, U.S. actress (b. St. Louis, Mo., Feb. 22, 1872—d. New York, N.Y., Jan. 27, 1952).

Webster, H(aro)ld T(ucker), U.S. cartoonist (b. Parkersburg, W.Va., Sept. 21, 1885—d. Stamford, Conn., Sept. 22, 1952), was educated in the public schools at Tomahawk, Wis. He worked for the *Chicago Daily News* (1903-05) and the old *Chicago Inter-Ocean* (1905-08) and finally went to New York city, where he was from 1931 staff cartoonist for the *New York Herald Tribune*. His series of cartoons entitled "The Timid Soul," featuring a meek character named Milquetoast, became nationally famous. Others of his series, also widely syndicated, were "The Thrill That Comes Once in a Lifetime," "Life's Darkest Moment," "The Boy Who Made Good," "How to Torture Your Wife" and "Poker Portraits."

Weed, Lewis Hill, U.S. anatomist (b. Cleveland, O., Nov. 15, 1886—d. Reading, Pa., Dec. 21, 1952).

Weinman, Adolph Alexander, U.S. sculptor (b. Karlsruhe, Ger., Dec. 11, 1870—d. Port Chester, N.Y., Aug. 8, 1952), emigrated as a child to New York city, where he was a student at Cooper union and later studied sculpture under Augustus Saint-Gaudens at the Art Students League. He opened his own studio in 1901 and first attracted notice for his group of American Indians at the St. Louis, Mo., world's fair of 1904. Other well-known works of his, all in the conservative mode of sculpture, include a pediment of the national archives building in Washington, D.C., a monumental frieze for the Elks national memorial building in Chicago, Ill., a frieze for the supreme court building in Washington, a pediment group for the Thomas Jefferson national memorial in Washington, and various figures for the state capitols of Kentucky, Wisconsin, Missouri and Louisiana. Weinman was the recipient of several international awards in sculpture and was president of the National Sculpture society from 1927 to 1930.

Weizmann, Chaim, Israeli statesman (b. Motol, near Pinsk, Byelorussia, Nov. 27, 1874—d. Rehovot, Israel, Nov. 9, 1952), was educated at Pinsk, and later studied at the universities of Berlin and Freiburg, Baden. A distinguished chemist, he was appointed a lecturer at Geneva university in 1901 and three years later went to England where he became reader in biochemistry at Manchester. In 1916 he was appointed director of the admiralty laboratories by Winston Churchill. This appointment brought him into contact with political leaders, including Herbert Samuel (later Viscount Samuel) and A. J. Balfour (later the earl of Balfour). His activities for Zionism led to the Balfour declaration on Nov. 2, 1917, and early in 1918 he went to Palestine as head of the Zionist organization. In 1919 he presented the Jewish national claims at the Versailles peace conference. He was president of the World Zionist organization from 1920 to 1931, when he resigned in protest at the British White Paper on Palestine, but served again from 1935 to 1946. In 1929 the Jewish Agency for Palestine was created and he was appointed president. In 1939 he offered his services to the British government and was honorary adviser to the ministry of supply until 1945. By then he was in favour of the partition of Palestine into Jewish and Arab states, and the Zionist congress at Basel, Switz., in Dec. 1946, did not re-elect him as president. When the independent state of Israel was founded in May 1948 he was chosen as provisional president. He was elected first president on Feb. 17, 1949, and re-elected, although ill and confined to his home, on Nov. 19, 1951. He had settled in Palestine in 1934 when he was appointed director of the Daniel Sieff Research institute, Rehovot; he was later appointed director of the Weizmann Institute of Science. In 1932 he became chairman of the board of governors of the Hebrew university. His autobiography *Trial and Error* was published in 1949.

Wenrich, Percy, U.S. composer of popular music (b. Joplin, Mo., Jan. 23, 1880—d. New York, N.Y., March 17, 1952).

Wexler, Irving (WAXEY GORDON), U.S. racketeer (b. 1888?—d. Alcatraz Island, U.S., June 24, 1952).

White, Wallace Humphrey, Jr., U.S. legislator (b. Lewiston, Me., Aug. 6, 1877—d. Auburn, Me., March 31, 1952).

Widtsøe, John Andreas, U.S. educator and Mormon leader (b. Froya Island, Nor., Jan. 31, 1872—d. Salt Lake City, Utah, Nov. 29, 1952), emigrated with his mother to the United States as a youth and settled in Utah. He took his bachelor's degree from Harvard university in 1894 and continued his studies at the University of Göttingen, Ger., where he received his master's degree and his Ph.D. Beginning his career as a chemist with the Utah experimental station in 1894, he was later professor of chemistry at Utah State Agricultural college, Logan (1895-1905), director of the experimental station (1900-05), president of the Agricultural college (1907-16) and president of the University of Utah, Salt Lake City (1916-21). On March 17, 1921, he was elected a member of the Council of Twelve Apostles of the Latter Day Saints Church and at the time of his death was the second-ranking member of that governing body of the Mormons. Widtsøe was an internationally known authority on dry farming and wrote a number of works on the subject.

Wilson, Edward Harlan, U.S. surgeon and specialist in bone diseases of children (b. Columbus, O., May 31, 1891—d. Columbus, Dec. 14, 1952).

Wilson, Frank Norman, U.S. physician (b. Livonia, Mich., Nov. 19, 1890—d. Stockbridge, Mich., Sept. 11, 1952).

Winkelman, Henri-Gerard, Dutch army officer and World War II resistance leader (b. Maastricht, Neth., 1876—d. The Hague, Neth., Dec. 27, 1952).

Wirth, Louis, U.S. sociologist (b. Gemünden, Ger., Aug. 28, 1897—d. Buffalo, N.Y., May 3, 1952), was brought to the United States as a youth and became a naturalized U.S. citizen in 1924. He received his bachelor's, master's and doctor's degrees from The University of Chicago, where he later taught sociology, advancing to the rank of professor and associate dean of the social sciences division in 1940. Wirth, who was a consultant for the National Resources Planning board from 1935 to 1943, was the author of several sociological works.

Wood, Arthur Barton, Canadian insurance leader (b. Knowlton, Que., Oct. 28, 1870—d. Montreal, Que., June 14, 1952).

Worrell, William Hoyt, U.S. editor and orientalist (b. Toledo, O., April 28, 1879—d. Haverhill, Mass., Dec. 3, 1952).

Wright, John Dutton, U.S. author and educator of the deaf (b. Fredonia, N.Y., July 20, 1866—d. New York, N.Y., Jan. 19, 1952).

Wright, Louis Tompkins, U.S. surgeon (b. La Grange, Ga., July 23, 1891—d. New York, N.Y., Oct. 8, 1952), frequently referred to as the outstanding U.S. Negro physician of his time, graduated from Clark university at Atlanta, Ga., in 1911 and took his M.D. at Harvard university in 1915. He began practising surgery at New York city in 1919 and the following year joined the surgical staff of Harlem hospital, advancing to director of surgery there in 1943. In 1948 he was named president of the hospital's medical board. Wright was credited with research into methods of cancer prevention and with pioneer tests in the use of the antibiotic aureomycin. During World War I he was a medical corps officer with the United States expeditionary forces in France. He was awarded the Spingarn medal in 1940 for outstanding achievement by a Negro.

Yague, Juan, Spanish soldier and diplomat (d. Burgos, Sp., Oct. 21, 1952).

Obstetrics: see GYNAECOLOGY AND OBSTETRICS.

Occupational Diseases: see INDUSTRIAL HEALTH.

Oceanography. Oceanographic vessels ranged far and wide during the year 1952. The British R.R.S. "Discovery II" and the French vessel "Commandant Charcot" returned from the Antarctic and Indian oceans. The Danish R.V. "Galathea" returned from circumnavigating the globe, while the equatorial regions of both the Pacific and Atlantic oceans were investigated by vessels of the Scripps Institution of Oceanography, the U.S. navy electronics laboratory and the Woods Hole Oceanographic institution.

Geophysical explorations by British and U.S. vessels, frequently working in pairs, continued to obtain data requiring a re-examination of accepted geological hypotheses. The widespread distribution of well sifted sand layers in deep ocean sediments, the absence of continental type rock below the ocean floor and the shallow depth of the Mohorovic discontinuity (about 10 km. below the ocean floor compared with about 40 km. under the continents) led to much discussion in geological circles.

In the Pacific ocean a depth of 10,863 m. was sounded by H.M.S. "Challenger." About 366 m. deeper than the Cape Johnson depth in the Philippine trench, the new depth was located in the Mariana trench, 200 mi. southwest of Guam.

SAMPLERS FILLED with ocean water (tanks at left) taken from Atlantic depths of 10,000 ft. by scientists aboard a research vessel of the Woods Hole Oceanographic institution in 1952. Radioactive carbon dating methods indicated the water had not been near the surface in 1,750 years

Deep currents found to exist under the arctic ice pack, having a transport as great as one-twentieth of the Gulf stream, and the apparent slow return of deep water toward the equator—as evidenced from radiocarbon dating methods which indicated that water samples taken from a depth of 10,000 ft. had not been near the surface for 1,750 years—led to the reopening of the basic question of how much of the energy of the North Atlantic current system comes from the prevailing winds and how much from regional density differences maintained by the climate. However, much effort was still being expended in refining and improving the theoretical approach to purely wind-driven systems.

The nutrient rich water caused by upswelling off the North African coast was traced to within a few hundred miles of the South American coast during a four-month cruise of the R.V. "Atlantis" and R.V. "Albatross III." The biology, chemistry, hydrography and meteorology of the equatorial region were intensively investigated. Similar surveys were being undertaken in the tropical Pacific. The Danish R.V. "Galathea" found animal life at a depth of 10,000 m. in the Pacific ocean, more than 2,000 m. below any previously obtained. More than 125 specimens belonging to nine species were obtained. Living bacteria from bottom deposits were also taken.

The interaction between the ocean surface and the atmosphere received more and more attention, with active interest in the investigation of the dimensions and weight of sea spray droplets in the air, a matter of fundamental interest in the question of the exchange of moisture and heat between ocean and atmosphere.

Practical applications of oceanography were emphasized by the publication of a major report on wartime investigations of the fundamentals of the fouling of ship bottoms and its prevention, and a report on the disposal of pollutants at sea which led to active investigations of the dynamics of mixing between salt and fresh water in estuaries.

Oceanographers not only explored the sea by the classical method of ships, but used aeroplanes more and more for ocean current measurements by new instrumentation, to land on the arctic ice pack and finally to inhabit an ice island in the Arctic ocean. (See also COAST AND GEODETIC SURVEY, U.S.; MARINE BIOLOGY.)

Ohio. A north central state of the United States, popularly known as the "Buckeye state," Ohio officially became a state of the union on Feb. 19, 1803. Area: 41,222 sq.mi., including 222 sq.mi. of water; pop. (1950 census): 7,946,627, including 5,578,274 urban and 2,368,353 rural; 6,566,531 white and 1,380,096 nonwhite. The principal cities and their 1950 population figures are: Cleveland 914,808, Cincinnati 503,998, Columbus 375,901, Toledo 303,616, Akron 274,605, Dayton 243,872, Youngstown 168,330 and Canton 116,912.

History.—The quiet and sparsely populated hill country of

Pike county in southern Ohio prepared for a rapid transformation after the Atomic Energy commission announced in Aug. 1952 that a vast plant would be built there for the production of uranium 235 by gaseous diffusion. To provide power for the \$1,200,000,000 plant, two big generating stations were to be constructed along the Ohio river where they would have easy access to coal supplies by barge. They would burn 7,500,000 tons of coal a year and to meet the needs of the atomic plant would generate 1,800,000 kw. of electricity. The Goodyear Tire and Rubber company was to operate the uranium plant.

Ohio's 37th infantry division was mustered into federal service in January and underwent training at Camp Polk, La. Late January floods, the worst of which centred around Marietta, brought death to 10 persons and made 10,000 homeless for a while. Murray Seasongood resigned from the Ohio Turnpike commission in March after disagreements with other members and was replaced by A. J. Allen of Cincinnati. The Ohio supreme court again upheld the constitutionality of the turnpike act in July.

State officers in 1952 were: governor, Frank J. Lausche (Dem.); lieutenant governor, George D. Nye (Dem.); secretary of state, Ted W. Brown (Rep.); auditor, Joseph T. Ferguson (Dem.); treasurer, Roger W. Tracy (Rep.); attorney general, C. William O'Neill (Rep.).

Education.—In 1952 the state had 2,939 elementary schools with a total enrolment of 807,661 and a teaching staff of 25,972, and 1,170 secondary schools with an enrolment of 321,711 and a teaching staff of 18,934. State expenditures on education for the school year 1951-52 were approximately \$266,000,000. The state director of education in 1952 was Clyde Hisson.

Social Insurance and Assistance, Public Welfare and Related Programs.—The average number of recipients of general relief per month in the fiscal year ended June 30, 1952, was 20,077, including a monthly average of 3,440 cases which received only medical-hospital care; the total assistance extended was \$15,111,670. The average number per month receiving aid for the disabled was 4,251, and they received \$2,253,212; aid for the aged, 117,589 cases received a total of \$70,411,175; aid to dependent children, 13,729 cases received a total of \$11,566,161; aid to the blind, 3,772 cases received a total of \$2,203,488. Benefits paid by the Ohio bureau of unemployment compensation in the fiscal year ended June 30, 1952, totalled \$34,723,533 in compensation for 1,586,533 weeks of unemployment. Workers covered by the Ohio unemployment compensation law at the beginning of 1952 totalled 2,398,943.

Ohio's four established penal institutions had an average daily population of 9,150 for the fiscal year ended June 30, 1952. Two industrial schools had an average daily population of 1,045. The Marion training school, which was opened in 1950 to rehabilitate and give vocational training to younger, more promising men who had been found guilty of violating criminal laws, had an average daily population of 79. Construction of a new building for the Marion school was begun in June 1952. Total operating costs of all welfare department institutions in the fiscal year 1952 were \$35,111,334. Farms operated by the department's institutions produced more than \$4,000,000 in agricultural products in the fiscal year.

Communications.—Ohio had 76,258 mi. of highways in 1952 outside of municipalities. Of this total, 16,048 mi. were classified as rural, 29,093 mi. as county and 41,116 mi. as township. Total state expenditures on highways in the fiscal year ended June 30, 1952, were \$80,095,207. The state had 8,400 mi. of railroads.

Banking and Finance.—There were 419 state and private banks in Ohio with deposits (June 30, 1952) of \$4,494,693,181 and resources of \$4,908,299,193. There were 238 active national banks in the state with deposits (June 30, 1952) of \$4,021,532,000 and resources of \$4,325,291,000. State-chartered savings and loan institutions numbered 477 with total resources (June 30, 1952) of \$1,612,742,167. There were 133 federal savings and loan associations with total assets (June 30, 1952) of \$988,485,637.

The state budget for the 1952-53 biennium was \$729,000,000. It is unconstitutional for the state to have a debt except for \$200,000,000 for

Table II.—Principal Industries of Ohio

	Value added by manufacture	
	1950	1949
Food and kindred products	\$476,568,000	\$509,037,000
Tobacco manufactures	11,334,000	9,790,000
Textile mill products	62,956,000	48,948,000
Apparel and related products	128,892,000	131,568,000
Furniture and fixtures	141,523,000	154,421,000
Paper and allied products	262,990,000	195,378,000
Printing and publishing industries	361,088,000	344,833,000
Chemicals and allied products	416,558,000	348,211,000
Petroleum and coal products	152,941,000	109,935,000
Rubber products	498,501,000	353,453,000
Leather and leather products	58,968,000	60,119,000
Stone, clay and glass products	402,121,000	338,910,000
Primary metal industries	1,263,579,000	874,928,000
Fabricated metal products	787,286,000	609,473,000
Machinery (except electrical)	1,360,683,000	1,097,656,000
Electrical machinery	541,373,000	428,825,000
Transportation equipment	779,810,000	585,329,000
Miscellaneous manufactures	184,368,000	152,740,000

a soldiers' bonus for which provision was made by a constitutional amendment. The Ohio Turnpike commission on June 4, 1952, sold \$326,000,000 in turnpike revenue bonds, the largest issue of this kind ever brought out. The purpose of the issue was to finance construction of 241 mi. of superhighway from the Pennsylvania turnpike across Ohio to the Indiana line in northwestern Ohio.

Agriculture.—Farm land prices in Ohio continued to advance rapidly, increasing 11% from July 1951 to July 1952, one of the most rapid advances in the nation. Values were up 216% compared with 1935-39. Estimated total value of Ohio farm land and buildings as of March 1952 was \$3,808,000,000, or \$181.60 per acre. Farm debt continued to increase. Cash receipts from farm marketings during the first eight months of the year totalled \$674,893,000, compared with \$678,768,000 for the same period in 1951. Livestock and products (\$480,865,000) were lower, and crops (\$194,028,000) somewhat higher than a year earlier. Farm costs increased. Cattle and calves on farms Jan. 1 numbered 2,279,000, 4% more than a year earlier—of the total 1,019,000 were milk cows over two years of age. Hogs (3,137,000) were 97% as high as in 1951. Sheep and lambs (1,249,000) were 15% more than in 1951; chickens (19,433,000) were 6% more numerous.

Manufacturing.—The total value added by manufacture in Ohio in 1950 was \$7,967,482,000, compared with \$6,412,895,000 in 1949, according to the census of manufactures made by the bureau of the census of the United States department of commerce. The average number of production workers in 1950 was 1,167,117, compared with 1,078,746 in 1949, and they were paid wages totalling \$4,166,850,000 in 1950, compared with \$3,585,634,000 in 1949.

Mineral Production.—Table III shows the tonnage and value of those mineral commodities produced in Ohio in 1949 and 1950, listing all items whose value exceeded \$100,000. Data for 1951 were not yet avail-

Table III.—Mineral Production of Ohio

Mineral	(Short tons, except as noted)			
	1950	Value	1949	Value
Cement (bbl.)	10,512,000	\$24,013,000	10,157,000	\$22,389,000
Clays	4,498,000	8,695,000	4,044,000	7,448,000
Coal	37,761,000	143,853,000	30,961,000	123,053,000
Coke	10,314,000	130,017,000	8,911,000	111,443,000
Ferroalloys*	284,000	28,632,000	196,000	18,725,000
Iron, pig*	12,521,000	530,708,000	10,524,000	430,628,000
Lime	2,142,000	26,273,000	1,712,000	20,321,000
Natural gas (thousand cu.ft.)	43,163,000	8,374,000	46,512,000	8,991,000
Natural gasoline (bbl.)	103,000	344,000	123,000	432,000
Peat	22,000	245,000	20,000	181,000
Petroleum (bbl.)	3,383,000	10,250,000	3,483,000	10,200,000
Salt	2,515,000	5,492,000	2,196,000	5,135,000
Sand and gravel	15,664,000	16,209,000	14,956,000	14,429,000
Stone	20,466,000	28,629,000	19,364,000	27,419,000
Other minerals	2,195,000	...	2,082,000
Total		\$274,572,000		\$242,080,000

*Values for processed materials are not included in the totals.

able. Ohio ranks first among the states in the production of clays and lime, second in stone and third in salt, and stands 11th in value of mineral output, with 2.32% of the U.S. total. (P. Bx.; X.)

Potatoes, bu.	5,000,000	5,750,000	7,656,000

A west south central state of the United States, **Oklahoma.** Oklahoma was admitted as the 46th state on Nov. 16, 1907. The name "Oklahoma" is from the Choctaw Indian words meaning "red people," and was first applied to the Indian territory in 1866. The popular name "Sooner state" was from the term "sooner" used in referring to a person who entered and staked a claim sooner than the law stipulated when the first public lands in the Indian territory were opened to white settlement by the run for homesteads, April 22, 1889. Area: 69,919 sq.mi., including 888 sq.mi. of water surface. Pop. (1950 census): 2,233,351, a loss of 103,083 or 4.4% since the 1940 cen-

sus. The two largest cities, with 1950 census, are Oklahoma City, the capital, 243,504; and Tulsa, 182,740. Other cities are Muskogee, 37,289; Enid, 36,017; Lawton, 34,757; Norman, 27,006; Shawnee, 22,948; Stillwater, 20,238; Ponca City, 20,180; Bartlesville, 19,228; Okmulgee, 18,317; Ardmore, 17,890; McAlester, 17,878; Ada, 15,995; Chickasha, 15,842.

History.—The chief officers during 1952, all Democrats, were: Johnston Murray, governor; James E. Berry, lieutenant governor; John D. Conner, secretary of state; Wilburn Cartwright, state auditor; Mac Q. Williamson, attorney general; A. S. J. Shaw, state treasurer; Oliver Hodge, superintendent of public instruction; Charles G. Morris, state examiner and inspector; Jim Hughes, commissioner of labour; Buck Cook, commissioner of charities; Donald F. Dickey, commissioner of insurance; Andy Payne, clerk of supreme court; John M. Malloy, chief mine inspector. Oklahoma now has six U.S. congressional seats as provided by the 23rd state legislature in the congressional redistricting act necessitated by loss in the state's population from 1940 to 1950.

Education.—The total enrolment in Oklahoma public schools for the term 1951-52 was 510,276 (elementary and high school), with 19,166 teachers. The total cost of maintaining the elementary and high schools in the state was approximately \$87,000,000. State institutions of higher learning included the University of Oklahoma (Norman) and the Oklahoma Agricultural and Mechanical college (Stillwater), both graduate schools; and Oklahoma College for Women (Chickasha), Panhandle Agricultural and Mechanical college (Goodwell), Langston university (Negro, at Langston), and 6 colleges primarily for teacher training (Ada, Alva, Durant, Edmond, Tahlequah, Weatherford), all state-owned senior colleges. There were 16 two-year junior colleges, of which 7 were state-owned (including the Oklahoma Military academy at Claremore), 3 were independent with church affiliations and 6 were municipal. There were also 6 independent senior colleges with church affiliations. Negroes were admitted for graduate study in the state institutions of higher learning.

Social Insurance and Assistance, Public Welfare and Related Programs.—On Sept. 1, 1952, the Oklahoma department of public welfare reported 94,049 persons receiving old-age assistance, at an average of \$57.72 per month (a total of \$5,428,296); 17,901 dependent children families (14,474 caretakers and 45,869 children), each family receiving an average of \$68.94 (a total of \$1,234,044); and 2,436 blind cases, each receiving an average of \$64.90 (a total of \$158,096). On Sept. 1, 1952, the state department of health reported 48 counties in Oklahoma, representing 80% of the state's population, were covered by full-time local health departments, all of which (27 units) were under full-time medical directors. State-supported institutions included two tuberculosis sanatoriums, eight hospitals (six mental hospitals, one school for mental defectives and one hospital for epileptics), two orphanages, three schools for deaf and blind, four schools of correction, one reformatory and one penitentiary.

Communications.—The summary of disbursements by the state highway commission for construction and maintenance was \$24,146,390.04 for the period Jan. 1, 1952, to Sept. 1, 1952. The highway department was responsible for a highway system of 10,174 mi. in the state, as of Jan. 1, 1952. The total public open road mileage in Oklahoma was approximately 93,000. Railroad and electric mileage approximated 6,000 mi., not including sidings.

Banking and Finance.—The state budget office reported state expenditures at \$289,316,999.45 for the period July 1, 1951, to July 1, 1952; in the same period receipts were \$272,796,999.42. The 23rd state legislature appropriated \$143,489,422.01 for the biennium 1951-52, hence a large part of state income was earmarked. The state debt was \$34,420,000 as of July 1, 1952, arising from the road bond issue of \$36,000,000 voted in the 1950 election to be retired by \$2,600,000 regularly pledged from the cigarette tax.

The Oklahoma bank commissioner reported 199 national banks in the state, with a total deposit of \$1,559,404,000 on June 30, 1952; and 185 state banks, with a total deposit of \$319,878,000. In addition to the banks, 60 savings and loan associations had approximately \$221,000,000 in their savings and loan accounts.

Agriculture.—Oklahoma's wheat production in 1952 reached an all-time high of 108,927,000 bu. The unprecedented drought conditions in the late spring and the summer of 1952 lowered the production of fall harvested crops, the weather bureau records showing the state average precipitation for the period June through September as the lowest for any year since

Table I.—Principal Crops of Oklahoma

Crop	Indicated 1952	1951	Average 1941-50
Wheat, bu.	108,927,000	38,902,000	71,737,000
Corn, bu.	10,152,000	21,156,000	25,052,000
Oats, bu.	8,316,000	4,768,000	20,643,000
Grain sorghums, bu.	4,147,000	16,768,000	9,420,000
All hay, tons	1,503,000	1,799,000	1,715,000
Soybeans for beans, bu.	1,100,000	1,040,000	1,050,000
Peanuts, lb.	50,000,000	114,400,000	106,496,000
Pecans, lb.	5,000,000	25,000,000	19,660,000

Cotton, bales	215,000	462,000	455,000
Potatoes, bu.	520,000	526,000	1,359,000
Sweet potatoes	158,000	225,000	542,000
Peaches, bu.	247,000	413,000	438,000

Source: U.S. Department of Agriculture.

the records were started in 1892. The livestock and range report for Oct. 1, 1952, showed that the severe drought had brought critical shortage in range feed, hay and other feed crops with very little possibility of winter wheat pasture.

Manufacturing.—The Oklahoma employment security commission reported that the total nonagricultural employment in the state averaged 506,600 persons, including government and small firm employment, for the period Jan. 1, 1952, to June 30, 1952, with 77,200 engaged in manufacturing activities for the same period. Average covered employment in the state for 1951 was 294,800. Wages paid to all covered workers during the same year came to \$951,646,000. Manufacturing employees covered by the Oklahoma Employment Security act averaged 68,700 in 1951, and drew total wages of \$238,088,000. (M. H. W.)

Mineral Production.—Table II shows the tonnage and value of those mineral commodities produced in Oklahoma in 1949 and 1950, listing all items with value exceeding \$100,000. Data for 1951 were not yet available.

Table II.—Mineral Production of Oklahoma

(In short tons except as noted)

	1950		1949	
Mineral	Quantity	Value	Quantity	Value
Clays	315,000	\$ 313,000	244,000	\$ 222,000
Coal	2,679,000	14,567,000	3,022,000	15,242,000
Lead	21,000	5,596,000	20,000	6,275,000
Natural gas (thousand cu ft.)	482,360,000	23,636,000	435,262,000	20,327,000
Natural gasoline (bbl.) .	7,980,000	21,579,000	6,855,000	20,360,000
Petroleum (bbl.) .	164,599,000	423,020,000	151,660,000	388,250,000
Petroleum gases (bbl.) .	6,753,000	8,393,000	5,630,000	8,408,000
Sand and gravel	3,287,000	2,357,000	2,921,000	1,526,000
Stone	5,022,000	4,848,000	4,342,000	4,028,000
Zinc	47,000	13,274,000	44,000	10,920,000
Other minerals	9,512,000	...	8,706,000
Total		\$527,095,000		\$484,264,000

able. Oklahoma ranks fourth among the states in the production of petroleum and natural gas, and stands sixth in the value of mineral output, with 4.45% of the U.S. total.

Olympic Games. Finland played host to the greatest sports competition of all time, the XVth Olympiad, in the summer of 1952. The colourful meet attracted a record entry of 5,867 athletes, representing 69 countries, to the stadia and playing fields of Helsinki. Among the nations represented was the U.S.S.R., which took part in the summer Olympic games for the first time since 1912. Although a number of preliminary events had been run off earlier, the games were officially proclaimed opened by Pres. Juho K. Paasikivi of Finland on July 19 as 70,000 persons looked on. The competition was witnessed by considerably more than 1,000,000 spectators, the track and field events alone attracting between 60,000 and 70,000 daily.

Although no team championship was at stake in the Olympics, the United States led in the unofficial scoring with 614 points and the U.S.S.R., with 553½, was second. United States athletes took home 40 gold medals in 12 sports, more than did any other country's entries; Russians won 23.

Table I.—Team Standings, Summer Games, 1952

(Unofficial scoring based on ten points for first place, five for second, four for third, three for fourth, two for fifth and one for sixth)

United States	614	Poland	26½
U.S.S.R.	553½	Austria	23
Hungary	308	Egypt	22
Sweden	267	Yugoslavia	22
Germany	170½	New Zealand	19
Finland	162½	Luxembourg	17
Italy	158½	India	17
France	156¼	South Korea	16½

Canada	30	Singapore	1
Brazil	30		

Scenes at the summer games of the XVth Olympiad, held in Helsinki, Fin., July 19-August 3, 1952, in which the U.S. ranked first in the unofficial scoring with 614 points and the U.S.S.R. second with 553½ points

Above, left: BOB MATHIAS of the U.S. (centre), winner of the decathlon with a record 7,887 points. Second and third places went to U.S. contestants Milton Campbell (right) with 6,975 points and Floyd Simmons with 6,788 points

Above, right: OLYMPIC GOLD MEDAL received by each first place winner in an Olympic event (top, obverse side of medal; bottom, reverse side)

Right: TEAMS OF ATHLETES parading around the stadium on the opening day of the games. The Vietnam group is in the foreground, followed by the larger U.S. group. Over the rain-dampened stadium waved the flags of the competing nations

Below, left: U.S. WINNERS in the women's high diving finals. Left to right: Paula Myers, second place; Pat McCormick, gold medal winner for first place; Juno Irwin, third place

Below, right: TORCH KINDLED in Lapland by rays from the midnight sun, and carried by relay to Tornio, Fin., where it was fused with a torch ignited in Olympia, Gr. The latter was then brought to the Olympic stadium in Helsinki to light the Olympic flame

Basketball.—The United States retained laurels in the round-robin series by halting the U.S.S.R., 36-25, in the final after leading by only 17-15 at half time. Clyde Lovellette, with nine points, paced the winners in scoring while Bob Kurland contributed eight tallies. Earlier in the tournament, the U.S. team had beaten the Soviet five, 86-58.

Boxing.—United States fighters, who hadn't won an Olympic title since 1932, not only captured five gold medals and the unofficial team honours, but won a silver cup awarded to the outstanding boxer in the tourney. Norvel Lee, light heavyweight from Washington, D.C., who outpointed Antonio Pacenza of Argentina in his last bout, was chosen as the star of the meet.

Gymnastics.—Twenty-three countries sent a record number of 183 competitors, and Russian men and women won the lion's share of the medals. Victor Tchoukarine was the all-around ace of the Soviet team, winning on the pommel (side) horse and long horse and placing second on the rings and parallel bars as his team tallied 573.60 points. Switzerland was runner-up and the United States placed eighth. Soviet women also led their group with 528.46 points although closely pressed by Hungary with 521.34. The United States women finished 15th.

Rowing.—The U.S. navy's eight wrote a fitting climax to an undefeated season by winning on rain-swept Meilahti gulf on July 23 to give the United States its seventh straight title in Olympic racing for the big shells. The young crew from Annapolis scored by a length and a quarter over a powerful Russian eight. Australia, Great Britain and Germany followed in that order. Charles Logg, Jr., and Tom Price, Rutgers university students, rowed to an upset victory in the event for pairs without coxswain, defeating Belgium's European champions, Michel Knuysen and R. F. L. Baetens, by a length in 8 min. 20.7 sec. A smooth oarsman from Russia, Jurij Tjukalov, won a convincing victory in the single sculls. The 22-year-old star won from Mervyn Wood of Australia, the defending champion and Diamond Sculls titleholder, in 8 min. 12.8 sec.

Swimming.—Every record in the Olympic books was erased in either the preliminary heats or finals as United States mermen captured six events and placed second in the other two. Michigan State's Clark Scholes won the 100-m. free style in 57.4 sec. after a qualifying semifinal of 57.1 sec. that broke Wally Ris's standard of 57.3 sec. set at London in 1948. A team of Wayne Moore, Bill Woolsey, Ford Konno and Jim McLane took the 800-m. relay in 8 min. 31.1 sec. to better another record set by the U.S. at 8 min. 46 sec. in 1948. The 100-m. backstroke went to Yoshinobu Oyakawa of Honolulu in 1 min. 5.4 sec., a time that bettered Adolph Kiefer's 1 min. 5.9 sec. established in 1936. Ford Konno won the 1,500-m. free style in 18 min. 30 sec. to eclipse the record of 19 min. 12.4 sec. set by Japan's Kitamura in 1932. Every man in the final was under the old mark. David Browning of Dallas, Tex., led his teammates to a sweep of the springboard diving medals as Miller Anderson was second and Bob Clotworthy third. Sammy Lee of Fresno, Calif., added another victory off the high platform. Jean Boiteux gained the first triumph France ever attained in men's Olympic swimming when he edged out Konno at 400 m., winning in 4 min. 30.7 sec. compared with the old mark of 4 min. 41 sec. set by Bill Smith in 1948. Konno was clocked at 4 min. 31.3 sec. John Davies of Australia took the 200-m. breast stroke in 2 min. 34.4 sec. All eight finalists in the race had bettered the former record of 2 min. 39.3 sec. in their qualifying trials. Mermaids from Hungary dominated the women's events, their most sparkling triumph coming in the 400-m. relay when they established a new Olympic and world mark of 4 min. 24.4 sec. Mrs. Pat Keller McCormick of Long Beach, Calif., was the only competitor to win two gold medals, defeating Mady Moreau of France and Mrs. Zoe Ann Olsen Jensen in the springboard dive

and leading her teammates, Paula Jean Myers and Mrs. June Stover Irwin, to a sweep of the first three places in high diving.

Track and Field.—A well-balanced squad from the United States scored a smashing victory in men's competition, taking 14 firsts while breaking or equalling 11 Olympic records. However, Emil Zatopek of Czechoslovakia proved himself the greatest distance man of his era and the individual star of the games by capturing three gold medals and setting new standards three times. Zatopek won the 5,000-m. run in 14 min. 6.6 sec. to better the record clocking of 14 min. 15.4 sec. turned in by Herbert Schade of Germany in a qualifying heat. Schade finished third behind France's Alain Mimoun in the final. Then Zatopek annexed the 10,000-m. in 29 min. 17 sec. to improve on the mark of 29 min. 59.6 sec. he had set in 1948 at London. Zatopek capped his performances with a brilliant triumph in the marathon, winning in 2 hr. 23 min. 3.2 sec. to shatter the standard of 2 hr. 29 min. 19.2 sec. established by K. Son of Japan in 1936. Lindy Remigino of the United States was victor in one of the closest finishes of the entire games when he edged out Jamaica's Herb McKenley in the 100-m. dash. Both were timed in 10.2 sec. in a photo finish. Andy Stanfield tied the record of 20.1 sec. as United States runners swept the first three places in the 200-m. dash and Mal Whitfield equalled his own Olympic mark of 1 min. 49.2 sec. as he annexed the 800-m. run. Harrison Dillard clipped .2 sec. off Bill Porter's mark by winning the 110-m. hurdles in 13.7 sec. and Charles Moore captured the 400-m. hurdles in 50.8 sec. to tie the Olympic record he had set in a preliminary heat. Horace Ashenfelter scored a surprise triumph for the United States in the 3,000-m. steeplechase establishing a new time of 8 min. 45.4 sec.

Jamaica's 1,600-m. relay team of Arthur Wint, Les Laing, McKenley and Rhoden bettered both the Olympic and world records as it won in 3 min. 3.9 sec., and Giuseppe Dordoni of Italy shattered all standards for the 50-km. walk when he finished first in 4 hr. 28 min. 7.8 sec. Three other universal marks fell in the field events. Adhemar da Silva, Brazilian, covered 53 ft. 2.59 in. in the hop, step and jump to surpass the world record of 52 ft. 6.30 in. he had set in 1951. Jozef Csermak of Hungary won the hammer throw at 197 ft. 11.67 in., which exceeded both the Olympic and world standards, and Bob Mathias retained his Olympic decathlon crown with an all-time high total of 7,887 points. Mathias was pressed by a young high school athlete from Plainfield, N.J., Milton Campbell, who finished second with 6,975 points. The Zatopek family added another gold medal to its collection when Emil's wife, Dana, annexed the javelin throw at 165 ft. 7.05 in. in the women's competition, a record for the games. Marjorie Jackson, Australian star, gained a double triumph in the dashes and tied the Olympic and world standard of 11.5 sec. in the 100-m. test. United States girls were able to win only one event, the 400-m. relay team of Mae Faggs, Barbara Jones, Janet Moreau and Catherine Hardy setting a new universal record of 45.9 sec.

Winter Games.—Dick Button of Englewood, N.J., gained the first-place votes of all nine judges as he retained his figure skating championship at the VIth Winter Olympiad held in Oslo, Nor. After taking a lead in the compulsory figures, the United States star gave a daring exhibition of free skating at the Bislett stadium to triumph with 192.256 points. Button, the only competitor to keep a title in the winter games, easily defeated Hellmut Seibt of Austria, who was credited with 180.144 tallies. Jeannette Altwegg of Streatham, Eng., captured the first-place medal among the women figure skaters, amassing 161.756 points. Tenley Albright of the United States was the runner-up.

The games, with competition scheduled from Feb. 14 to Feb. 25, 1952, attracted 1,178 entries from 30 countries. Norway, the host nation, scored heavily in skiing and speed skating for

a total of 125½ points to lead all visiting squads for the unofficial team honours. The United States was second. Canada triumphed in hockey with seven victories and one tie, the deadlock at 3-3 coming in a contest with the U.S. six.

Table II.—Team Standings, Winter Games, 1952

(Unofficial scoring of nations based on ten points for first place, five for second, four for third, three for fourth, two for fifth and one for sixth)

Norway	125½	Switzerland	23
United States	89½	Canada	18½
Finland	73	Britain	13
Austria	60	France	10
Germany	50½	Hungary	4
Sweden	29½	Belgium	1
Italy	25	Japan	½
Netherlands	24		

Hjalmar Andersen of Norway was the individual star of the games, taking three speed skating events, two in record time. After winning at 1,500 m., Andersen set an Olympic standard of 8 min. 10.6 sec. for 5,000 m., and then shattered the previous Olympic and world marks by taking the 10,000-m. event in 16 min. 45.8 sec.

Mrs. Andrea Mead Lawrence of Rutland, Vt., took two skiing firsts for the United States for the only double triumph among women competitors. She won both the slalom and giant slalom and became the first American woman ever to win two gold medals in the winter contests.

SUMMER OLYMPIC CHAMPIONS, 1952

Basketball

Team—United States.

Boxing

Team—United States.
Flyweight—Nate Brooks, United States.
Bantamweight—Pentti Hamalainen, Finland.
Featherweight—Jan Zachara, Czechoslovakia.
Lightweight—Aureliano Bolognesi, Italy.
Light-welterweight—Charley Adkins, United States.
Welterweight—Zygmunt Chychla, Poland.
Light-middleweight—Laszlo Papp, Hungary.
Middleweight—Floyd Patterson, United States.
Light-heavyweight—Norvel Lee, United States.
Heavyweight—Eddie Sanders, United States.

Canoeing

10,000-m. Canadian singles—Frank B. Havens, United States, 57 min. 41.1 sec.
10,000-m. Canadian pairs—Georges Turtlier and Jean Laudet, France, 54 min. 8.3 sec.
10,000-m. kayak pairs—Kurt Wires and Yrjo Hietanen, Finland, 44 min. 21.3 sec.
10,000-m. kayak singles—Thorvald Stromberg, Finland, 47 min. 22.8 sec.
1,000-m. kayak singles—Gert Frederiksson, Sweden, 4 min. 7.9 sec.
1,000-m. Canadian singles—Josef Holecck, Czechoslovakia, 4 min. 56.3 sec.
1,000-m. kayak pairs—Kurt Wires and Yrjo Hietanen, 3 min. 51.1 sec.
1,000-m. Canadian pairs—B. Rasch and F. Haunstoft, Denmark, 4 min. 38.3 sec.
Women's 500-m. kayak singles—Sylvia Saimo, Finland, 2 min. 18.4 sec.

Cycling

4,000-m. team pursuit race—Italy, 4 min. 46.1 sec.
1,000-m. scratch race—Enzo Sacchi, Italy, no time given.
2,000-m. tandem—Lionel Cox and Russell Mockridge, Australia, no time given.
1,000-m. time trial—Mockridge, Australia, 1 min. 11.1 sec. (Olympic record).
Road race, individual—André Noyelle, Belgium, 5 hr. 6 min. 3.4 sec.
Road race, team—Belgium, total time 15 hr. 20 min. 46.6 sec.

Equestrian

Dressage, individual—Henri St. Cyr, Sweden.
Dressage, team—Sweden.
Three-day event, individual—Hans von Blixen-Finecke, Sweden.
Three-day event, team—Sweden.
Prix des Nations jumping, individual—Pierre d'Oriola, France.
Prix des Nations jumping, team—Great Britain.

Fencing

Men's foil, individual—Christian d'Oriola, France.
Men's foil team—France.
Men's épée, individual—Edoardo Mangiarotti, Italy.
Men's épée, team—Italy.
Men's sabre, individual—Paul Kovacs, Hungary.
Men's sabre, team—Hungary.
Women's foil—Irene Camber, Italy.

Field Hockey

Team—India.

Modern Pentathlon

Individual—Lars Hall, Sweden, 32 points.
Team—Hungary, 166 points.

Gymnastics, Men

Team—U.S.S.R.
Long horse—Victor Tchoukarine, U.S.S.R.
Horizontal bar—Jack Günthard, Switzerland.
Floor exercises—Karl Thoreson, Sweden.
Rings—Grant Chaguinian, U.S.S.R.
Parallel bars—Hans Eugster, Switzerland.
Pommel horse—Tchoukarine.
Individual combined—Tchoukarine.

Gymnastics, Women

Team—U.S.S.R.
Beam exercises—N. Botcharova, U.S.S.R.
Floor exercises—N. Botcharova.
Horse vault—Ekaterina Kalinhouk, U.S.S.R.

Eight exercises—Marie Gorokhovskaja, U.S.S.R.
Parallel bars—Marjit Korondi, Hungary.
Team exercises with hand equipment—Sweden.

Rowing

Single sculls—Jurij Tjukalov, U.S.S.R., 8 min. 12.8 sec.
Double sculls—T. Cappozzo and E. Guerrero, Argentina, 7 min. 32.2 sec.
Pairs without coxswain—Charles Logg and Tom Price, United States (Rutgers) 8 min. 20.7 sec.
Pairs with coxswain—France, 8 min. 28.6 sec.
Fours without coxswain—Yugoslavia, 7 min. 19.2 sec.
Fours with coxswain—Czechoslovakia, 7 min. 33.4 sec.
Eight oars with coxswain—United States (Navy) 6 min. 25.9 sec.

Shooting

Free pistol—Huelet Benner, United States, 553 points.
Clay pigeon—George Genereux, Canada, 192 points.
Small-bore rifle, all-around—E. Kongshaug, Norway, 1,164 points.
Running deer—John Larsen, Norway.
Free rifle—Anatoli Bogdanov, U.S.S.R., 1,123 points (Olympic record).
Silhouette—Karoly Takacs, Hungary, 579 points.
Small-bore rifle, prone—I. Sarbu, Rumania, 400 points.

Swimming, Men

100-m. free style—Clark Scholes, United States, 57.4 sec.
800-m. free style relay—United States team of Wayne Moore, Bill Woolsey, Ford Konno and Jim McLane, 8 min. 31.1 sec. (Olympic record).
400-m. free style—Jean Boiteux, France, 4 min. 30.7 sec. (Olympic record).
100-m. backstroke—Yoshinobu Oyakawa, United States, 1 min. 5.4 sec. (Olympic record).
200-m. breast stroke—John Davies, Australia, 2 min. 34.4 sec. (Olympic record).
1,500-m. free style—Ford Konno, United States, 18 min. 30 sec. (Olympic record).
Springboard dive—David Browning, United States, 205.29 points.
High dive—Sammy Lee, United States 156.28 pts.

Swimming, Women

100-m. free style—Katalin Szoke, Hungary, 1 min. 6.8 sec.
200-m. breast stroke—Eva Szekeley, Hungary, 2 min. 51.7 sec. (Olympic record).
100-m. backstroke—Joan Harrison, South Africa, 1 min. 14.3 sec.
400-m. free style—Valerie Gyenge, Hungary, 5 min. 12.1 sec. (Olympic record).
400-m. free style relay—Hungary, 4 min. 24.4 sec. (Olympic and world record).
Springboard dive—Mrs. Pat McCormick, United States, 147.30 points.
High dive—Mrs. Pat McCormick, United States, 79.37 points.

Track and Field, Men

100-m. dash—Lindy Remigino, United States, 10.4 sec.
200-m. dash—Andy Stanfield, United States, 20.7 sec. (tied Olympic record).
400-m. run—George Rhoden, Jamaica, 45.9 sec. (Olympic record).
800-m. run—Mal Whitfield, United States, 1 min. 49.2 sec. (tied own Olympic record set in 1948).
1,500-m. run—Joseph Barthel, Luxembourg, 3 min. 45.2 sec. (Olympic record).
3,000-m. steeplechase—Horace Ashenfelter, United States, 8 min. 45.4 sec. (Olympic record).
5,000-m. run—Emil Zatopek, Czechoslovakia, 14 min. 6.6 sec. (Olympic record).
10,000-m. run—Zatopek, 29 min. 17 sec. (Olympic record).
Marathon—Zatopek, 2 hr. 23 min. 3.2 sec. (Olympic record).
110-m. hurdles—Harrison Dillard, United States, 13.7 sec. (Olympic record).
400-m. hurdles—Charles Moore, United States, 50.8 sec. (tied Olympic record he set in preliminary heat).
400-m. relay—United States team of Dean Smith, Dillard, Remigino and Stanfield, 40.1 sec.
1,600-m. relay—Jamaica team of Arthur Wint, Les Laing, Herb McKenley and Rhoden, 3 min. 3.9 sec. (Olympic and world record).
50-km. walk—Giuseppe Dordoni, Italy, 4 hr. 28 min. 7.8 sec. (Olympic and world record).
10,000-m. walk—John Mikaelsson, Sweden, 45 min. 2.8 sec. (Olympic record).
High jump—Walt Davis, United States, 6 ft. 8.32 in. (Olympic record).
Broad jump—Jerome Biffle, United States, 24 ft. 10.03 in.
Pole vault—Bob Richards, United States, 14 ft. 11.14 in. (Olympic record).
Hop, step and jump—Adhemar da Silva, Brazil, 53 ft. 2.59 in. (Olympic and world record).
Hammer throw—Jozef Csermak, Hungary, 197 ft. 11.67 in. (Olympic and world record).
Shot-put—Parry O'Brien, United States, 57 ft. 1.43 in. (Olympic record).
Discus throw—Sim Iness, United States, 180 ft. 6.85 in. (Olympic record).
Javelin throw—Cy Young, United States, 242 ft. 7.9 in. (Olympic record).
Decathlon—Bob Mathias, United States, 7,887 points (Olympic and world record).

Track and Field, Women

100-m. dash—Marjorie Jackson, Australia, 11.5 sec. (tied Olympic and world record).
200-m. dash—Marjorie Jackson, 23.7 sec.
80-m. hurdles—Mrs. Shirley Strickland de la Hunty, Australia, 10.9 sec. (Olympic and world record).
400-m. relay—United States team of Mae Faggs, Barbara Jones, Janet Moreau and Catherine Hardy, 45.9 sec. (Olympic and world record).
Javelin throw—Mrs. Dana Zatopek, Czechoslovakia, 165 ft. 7.05 in. (Olympic record).
Broad jump—Yvette Williams, New Zealand, 20 ft. 5.66 in. (Olympic record).
High jump—Ester Brand, South Africa, 5 ft. 5¾ in.
Discus throw—Nina Romaschkova, U.S.S.R., 168 ft. 8½ in. (Olympic record).
Shot-put—Galina Zybina, U.S.S.R., 50 ft. 2.58 in. (Olympic and world record).

Water Polo

Team—Hungary.

Weight Lifting

Bantamweight—Ivan Udodov, U.S.S.R., 694 lb. (Olympic record).
Featherweight—Rafael Chimishkyan, U.S.S.R., 743½ lb. (Olympic and world record).
Lightweight—Tommy T. Kono, United States, 798¾ lb. (Olympic record).
Middleweight—Peter George, United States, 881½ lb. (Olympic record).
Light heavyweight—T. Lomakin, U.S.S.R., 920¼ lb.
Middle heavyweight—Norbert Schemansky, United States, 980¾ lb.
Heavyweight—John Davis, United States, 1,013¾ lb. (Olympic record).

Wrestling, Free Style

Flyweight—Hassen Gemic, Turkey.
Bantamweight—Shohachi Ishii, Japan.
Featherweight—Bayram Sit, Turkey.
Lightweight—Olle Anderberg, Sweden.
Welterweight—Bill Smith, United States.
Middleweight—David Cimakuridze, U.S.S.R.
Light heavyweight—Wiking Palm, Sweden.
Heavyweight—Arsen Mekokishvili, U.S.S.R.

Wrestling, Graeco-Roman

Flyweight—Boris Gourevitch, U.S.S.R.
Bantamweight—Imre Hados, Hungary.
Featherweight—Jakov Pounkine, U.S.S.R.
Lightweight—Chasame Safine, U.S.S.R.
Welterweight—Miklos Szilvasi, Hungary.
Middleweight—Axel Gronberg, Sweden.
Light heavyweight—Kolpo Grandahl, Finland.
Heavyweight—Ioganes Kotkas, U.S.S.R.

Yachting

Star class—"Merope," Italy.
 Finn class—Denmark.
 Dragon class—"Pan," Norway.
 5.5-m. class—"Complex II" (B. F. Chance), United States.
 6-m. class—"Llanoria" (H. F. Whiton), United States.

WINTER OLYMPIC CHAMPIONS, 1952

Bobsledding

Two-Man—Germany's No. 1 team, Andreas Ostler and Lorenz Nieberl, 5 min. 24.54 sec.
 Four-Man—Germany's No. 1 team, Ostler, Nieberl, Fritz Kuhn, Franz Kemser, 5 min. 07.83 sec.

Figure Skating

Men—Dick Button, United States, 192.256 points.
 Women—Jeannette Altwegg, Great Britain, 161.756 points.
 Pairs—Ria and Paul Falk, Germany, 11.400 points.

Ice Hockey

Team—Canada.

Skiing, Men

Jumping—Arnfinn Bergmann, Norway, 226 points.
 Slalom—Othmar Schneider, Austria, 2 min.
 Giant slalom—Stein Eriksen, Norway, 2 min. 25 sec.
 Downhill—Zeno Colo, Italy, 2 min. 30.8 sec.
 Nordic combined (jump and race)—Simon Slattvik, Norway, 451.621 points.
 18-km. race—Halgeir Brenden, Norway, 1 hr. 1 min. 34 sec.
 40-km. relay—Finland's team, Heikki Hasu, Paavo Lonkila, Urpo Korhonen, Tapio Mäkelä, 2 hr. 20 min. 16 sec.
 40-km. race—Veikko Hakulinen, Finland, 3 hr. 33 min. 33 sec.

Skiing, Women

Slalom—Mrs. Andrea Mead Lawrence, United States, 2 min. 10.6 sec.
 Giant slalom—Mrs. Lawrence, 2 min. 6.8 sec.
 Downhill—Gertrude Jochum-Beiser, Austria, 1 min. 47.1 sec.
 10-km. race—Lydia Wideman, Finland, 41 min. 40 sec.

Speed Skating

500 m.—Ken Henry, United States, 43.2 sec.
 1,500 m.—Hjalmar Andersen, Norway, 2 min. 20.4 sec.
 5,000 m.—Andersen, 8 min. 10.6 sec. (Olympic record).
 10,000 m.—Andersen, 16 min. 45.8 sec. (Olympic record).

Oman and Muscat (Masqat): see ARABIA.

Ontario. Second largest province of Canada, Ontario joined the confederation in 1867. Area: 412,582 sq.mi. Pop. (1951) 4,597,542, of which 70.7% were urban. Capital: Toronto (1951) 675,754.

History.—Louis Orville Breithaupt, former federal member of parliament, succeeded Ray Lawson, industrialist, as lieutenant governor of Ontario during 1952. The first session of the 21st provincial legislature passed much important legislation, including laws to aid private industry to combat the housing shortage, to provide loans to aid young farmers, to ease rural housing, to give provincial assistance for construction of homes for the aged and to pay grants in lieu of taxes to municipalities for government offices. A special session of the legislature was held in October during which the federal-provincial tax agreement was ratified, steps were taken to provide reparations for those suffering property loss or damage through the proposed St. Lawrence Seaway and Power project, and the legislature was given more direct control over specific highway projects. During the first six months of 1952, 98,057 immigrants came to Canada, of which 52,472 settled in Ontario.

Education.—The drift of low-paid rural teachers to higher-salaried city jobs, and a rising enrolment (an increase of 108,952 in the 1947-52 period) forced the hand of the department of education. The rural teacher shortage was overcome by training grade 12 high school students in a special ten-week course to handle elementary-grade teaching.

Health and Welfare.—Pensions of \$40 per month were made available to totally and permanently disabled persons between the ages of 18 and 65.

Transportation and Communication.—The highway improvement act was amended to give the legislature power to vote all monies to be used by the highways department, and a highway reserve account was created within the consolidated revenue account to which such appropriations could be credited. The move was designed to speed up and intensify Ontario's highway improvement program. Radio-telephone service between snowplowing crews and headquarters was initiated over all of southern Ontario to encourage greater use of the 10,000 mi. of highways kept open during the winter. A total of \$92,000,000 was spent on 1951-52 highway improvements, and \$96,000,000 was budgeted for 1952-53.

Finance.—Gross ordinary provincial revenue for the fiscal year ending March 31, 1952, compared with estimates for the same year in parentheses: \$304,966,000 (\$265,980,000). Gross ordinary expenditures for the same period, with the same comparison: \$304,070,000 (\$265,382,000). Heaviest 1951-52 expenditures were as follows: education, \$67,888,000; health, \$44,980,000; welfare, \$25,507,000.

Agriculture.—Farm output was worth a record \$1,274,357,000 in 1951, or \$150,000,000 more than in 1950.

Industry.—In the 1946-52 period, 504 new manufacturing companies employing ten or more men each came into existence; the gross value of production in 1946 was \$3,755,000,000, in 1950 it was \$8,627,000,000. In July 1952 the employment index was 195.7 compared with 100 in 1939, while average weekly earnings were \$56.36 compared with \$24.45.

Oregon. A state of the United States, located in the Pacific northwest, Oregon was admitted Feb. 14, 1859, as the 33rd state. Area: 96,981 sq.mi. including 666 sq.mi. of water. Pop. (1950 census) 1,521,341, an increase of 39.6% from 1940. Capital: Salem (43,140); chief city: Portland (373,628).

History.—In politics the state usually has voted Republican, though Franklin D. Roosevelt carried the state in each election when he was a candidate for president. In the Republican primaries in May 1952, the vote favoured Gen. Dwight D. Eisenhower for the Republican nomination for president.

In November the electorate voted on 18 measures on the state ballot, of which 11 were constitutional amendments, 5 legislative bills referred to the people and 2 legislative bills initiated by the people.

Elective state officials (administrative) in 1952 included: governor, Douglas McKay; secretary of state, Earl T. Newbry; treasurer, Walter J. Pearson; attorney general, George Neuner; labour commissioner, W. E. Kimsey; superintendent of public instruction, Rex Putnam.

Education.—Enrolment in public schools during the school year 1950-51 was 294,328, including 68,793 enrolled in high schools. For the school year 1950-51 professional personnel employed in the public schools numbered 12,263 and the average salary was \$3,367. Total operating expenditures for the year were \$70,480,974. Per capita cost per pupil in average daily attendance was \$273.

Enrolment at 8 state institutions of higher learning in the year 1951-52 was 14,227 and an additional 11,023 were enrolled in the extension division of the state system of higher education. Total operating expenditures of the state system for the year ending June 30, 1952, were \$14,314,114.

Social Insurance and Assistance, Public Welfare and Related Programs.—Expenditures of the public welfare program (general assistance, old-age assistance, aid to the blind, to dependent children, to child-caring institutions, special services and administration) amounted to \$29,161,034 for the fiscal year ending June 30, 1952.

Payments for unemployment compensation in the year ending June 30, 1952, were \$13,889,242. The number of inmates in ten state health, corrective and eleemosynary institutions was 8,209 on June 30, 1952. Operating costs for the year were: two mental hospitals \$3,756,063; two tuberculosis hospitals \$978,982; Fairview home for feeble-minded \$1,236,193; penitentiary \$1,236,340; MacLaren school for boys (Woodburn) \$456,366; Hillcrest school for girls \$195,317; deaf school \$300,671; blind school \$141,427. Expenditures of the commission for the blind were \$134,174 for the year ending June 30, 1952.

Communications.—Steam railway mileage in the state as of Dec. 31, 1951, was 3,528, not including second main track and sidings, and was operated by 24 common carriers. Electric railway mileage as of the same date was 37, operated by 1 carrier.

As of Dec. 31, 1951, Oregon had 7,311 mi. in its state system of highways, of which 6,899 mi. were surfaced. Total mileage in the county road system as of that date was 30,950 of which 17,425 were surfaced. Expenditures of the state highway department for the fiscal year ending June 30, 1952, were \$46,809,782.

For that year, there were 624,784 passenger cars and 86,067 trucks and 1,719 buses registered in the state.

The number of telephone stations in service on Dec. 31, 1951, was 451,172, with 226 telephone exchanges.

Banking and Finance.—The state bonded debt as of July 1, 1952, was \$116,385,590; net debt \$83,300,375. The gross debt of municipal subdivisions on July 1, 1950, was \$182,062,915 and the net debt was \$143,488,000.

Table I.—Principal Crops of Oregon

Crop	Indicated 1952	1951	Average 1941-50
All wheat, bu.	30,568,000	28,999,000	2,350,000
Oats, bu.	9,718,000	7,395,000	9,753,000
Barley, bu.	10,350,000	10,110,000	9,565,000
Corn, bu.	1,188,000	1,092,000	1,310,000
Potatoes, bu.	12,060,000	11,220,000	10,960,000
Hay, tons	1,815,000	1,551,000	1,865,000
Apples, bu.	2,800,000	2,330,000	2,766,000
Pears, bu.	5,584,000	4,997,000	4,929,000
All prunes, tons	46,600	59,800	71,070
All cherries, tons	20,600	20,400	23,170
Peaches, bu.	647,000	400,000	576,000
Hops, lb.	16,510,000	18,774,000	16,464,000

INDIANS spear-fishing for salmon at Celilo falls on the Columbia river, Ore. Exclusive Indian treaty rights to fish in the falls were lost when the Dalles power dam was begun in 1952, since the area was to be flooded to form a 50-mi. lake

1958. Total state revenues for the fiscal year ending June 30, 1952, were \$580,092,380. Total assessed valuation, equalized, of taxable real and personal property in the state as of Jan. 1, 1952, was \$1,835,390,117. Total bank deposits on Sept. 5, 1952, were \$1,647,182,051. On that date there were 20 national banks with 89 branches and 50 state banks with 20 branches.

Agriculture.—Estimated cash receipts from farming for the year 1951 were \$434,437,000, which included \$3,352,000 in government payments. Receipts from crops were \$223,213,000 and from livestock and animal products \$207,872,000.

Manufacturing.—Lumbering is the principal manufacturing activity in Oregon. This state ranks first in the volume of lumber production, which in 1951 amounted to 8,884,745,000 board feet. Plywood production in 1951 was 1,189,408,743 sq.ft., three-eighths inch basis. (C. A. Sp.)

Mineral Production.—Table II shows the tonnage and value of mineral commodities produced in Oregon in 1949 and 1950, listing all items with value exceeding \$100,000. Data for 1951 were not yet available. Oregon

Table II.—Mineral Production of Oregon

(Short tons, except as noted)

Mineral	1950		1949	
	Quantity	Value	Quantity	Value
Gold (oz.)	11,058,000	\$ 387,000	16,226,000	\$ 568,000
Pumice	80,000	321,000	104,000	273,000
Sand and gravel	8,200,000	8,168,000	7,135,000	7,682,000
Stone	3,837,000	5,559,000	4,397,000	6,479,000
Other minerals	7,107,000	...	6,843,000
Total		\$21,542,000		\$21,845,000

ranks 38th among the states in the value of mineral output, with 0.18% of the U.S. total.

Organization for European Economic Cooperation:
see INTERNATIONAL TRADE; MUTUAL SECURITY PROGRAM.

Organization of American States. The Organization of American States was established pursuant to the charter signed at Bogotá, Col., in 1948 at the ninth International Conference of American States. The organization, which represented the most recent step in the development of the system of inter-American relations, had its inception in 1890 when the first conference met in Washington, D.C. Its purpose is to achieve an order of peace and justice, promote American solidarity, strengthen collaboration among the member states and defend their sovereignty, independence and territorial integrity. In Dec. 1951 Colombia became the 14th state to deposit its ratification and thereafter the charter entered into full force and effect. The

organization functions through six organs: the Inter-American conference; the Meeting of Consultation of Ministers of Foreign Affairs; the Council of the Organization; the Pan American Union; the specialized conferences; and the specialized organizations.

The Inter-American conference is the supreme organ of the organization. It decides general action and policy and determines the structure and functions of the organization. The conference did not meet in 1952, but preparations were begun for the tenth conference which was scheduled to meet in Caracas, Venez., in 1953. The government of Venezuela by decree of March 14, 1952, established a general secretariat for the conference, and the Council of the Organization prepared a draft regulation which was submitted to the member states for observation and comment. The council also began preliminary work on the program of the conference.

The Meeting of Consultation of Ministers of Foreign Affairs is convened whenever problems arise of urgent nature and of common interest to the member states. No meeting was held in 1952, but various agencies of the organization were active in giving effect to the resolutions adopted at the Meeting of Foreign Ministers held in Washington, D.C., in 1951. That meeting was called to consider the aggressive policy of international communism and the measures that should be taken by the American republics to meet it. The Inter-American Defense board continued its study of measures relating to military co-operation for the defense of the Americas. The Pan American Union completed a study of the legislation enacted and the measures adopted by the American republics for their internal security; and the Inter-American Economic and Social council and the Pan American Union undertook a series of studies relating to emergency economic co-operation.

The council is the permanent executive body of the organization. It is composed of one representative from each member state and has its seat at the Pan American Union in Washington, D.C. The council takes cognizance, within the limits of the charter and inter-American treaties and agreements, of any matter referred to it by the Inter-American conference or the Meeting of Consultation of Ministers of Foreign Affairs.

During 1952 the Council of the Organization continued its study of the structural development of the inter-American system. An agreement was concluded with the Inter-American Commission of Women whereby this agency was recognized as an inter-American specialized organization. In May 1952 an agreement was also signed with the Food and Agricultural Organization of the United Nations. The agreement was similar to that previously signed with the United Nations Educational, Scientific and Cultural organization and the International Labour organization, and provided for co-operative relations between the regional and world organizations. The council also formulated standards to govern the establishment of co-operative relations between the Organization of American States and nongovernmental organizations, and adopted a series of measures for the establishment of such relations.

The council also exercises general supervision over the functioning of the Pan American Union. In that capacity it approves the budget of the union and during 1952 made provision for a complete study and reclassification of the positions within the Pan American Union.

By the terms of the charter, three technical councils collaborate with the Council of the Organization: the Inter-American Economic and Social council; the Inter-American Council of Jurists; and the Inter-American Cultural council.

The Inter-American Economic and Social council has its seat at the Pan American Union in Washington, D.C., and has for its principal purpose the promotion of the economic and social

welfare of the American nations. During 1952 the Economic and Social council undertook a series of studies relating to scarce materials and products in accordance with decisions taken in 1951 at the fourth Meeting of Consultation of Ministers of Foreign Affairs. It also sponsored a program of technical co-operation which was to be carried out with the co-operation of the member states. Technical assistance projects were initiated in the field of agriculture with the co-operation of the Inter-American Institute of Agricultural Sciences; in public health and sanitation through the co-operation of the Pan American Sanitary bureau; in child welfare with the collaboration of the International American Institute for the Protection of Childhood; in housing and co-operatives through the Pan American Union; and in statistical education with the co-operation of the Pan American Union and the Inter-American Statistical institute.

The Inter-American Cultural council and the Inter-American Council of Jurists meet at periodic intervals. No meeting of either council was held in 1952 but during that year the Committee for Cultural Action, the permanent committee of the Cultural council, was set up in Mexico City and began to carry out studies agreed upon at the 1951 meeting of the council. The Inter-American Juridical committee, which is the permanent committee of the Inter-American Council of Jurists, has its seat in Rio de Janeiro, Braz., and during the year prepared a series of studies on international law.

The Pan American Union is the general secretariat and the permanent central organ of the organization. In that capacity and through its several technical and administrative subdivisions it services the other organs of the organization. It also makes studies and issues a variety of reports on economic, social, cultural and legal matters.

Of the Inter-American specialized organizations, the Pan American Institute of Geography and History, the Pan American Sanitary bureau and the Inter-American Commission of Women held meetings during the year. Inter-American conferences were also held to deal with a variety of subjects including copyright protection, travel promotion, public health and sanitation, social security, statistical education, municipal co-operation and library services.

Osteopathy: see MEDICINE.

Ottawa. The capital of Canada, at the confluence of the Ottawa-Gatineau-Rideau rivers, in the province of Ontario, covers 28,134 ac.; pop. (1951) 202,045, with 281,908 in the metropolitan area. In 1951 there were 268 industries in the city, employing 10,641 workers who received \$23,000,000 in wages and turned out \$82,000,000 worth of goods. Financing of the city's services continued to increase in cost. In 1952 the tax rate for public schools was 53.75 mills compared with 52.25 mills for 1951, and for separate schools 62.33 mills compared with 59.90 mills in 1951. Assessments also increased. Expenditures for 1952 were estimated as follows: general purposes, \$6,620,143; interest and principal on debentures, \$1,027,058; public libraries, \$158,172; civic hospital, \$509,517; public schools, \$2,430,088; collegiate institutes, \$1,595,487; separate schools, \$876,276. The city ended its March 31, 1951, financial year with a net surplus of \$115,835. Much construction was under way by mid-1952: trunk sewers, water mains, and housing topped the \$7,000,000 mark, and an additional \$3,000,000 was scheduled for street improvements. The federal government bore a share of the debenture costs for works arising out of a direct development of the national capital plan. The city decided to spend \$1,200,000 to install domestic water meters in an effort to reduce water consumption to 80 gal. per

capita per day (instead of 120 gal.) so as to postpone construction of a \$5,000,000 addition to the city water filtration plant. (C. CY.)

Pace, Frank, Jr. (1912-), U.S. government official. He received a bachelor's degree from Princeton university in 1933 and a law degree from Harvard university in 1936. In that year he became assistant district attorney in the 12th judicial district in Arkansas. From 1938 to 1940 he was general counsel of the Arkansas state department of revenue. During World War II he served in the air transport command, reaching the rank of major.

In 1946 he was made a special assistant in the U.S. department of justice, dealing with tax matters; in May 1946, executive assistant to the postmaster general; in Jan. 1948, assistant director of the bureau of the budget, and in Jan. 1949, director of that bureau. Late in March 1950 he was nominated secretary of the army. Secretary Pace, in Korea at the time Gen. Douglas MacArthur was relieved of his command, was revealed to have been charged with the responsibility of telling General MacArthur in advance, but was said in subsequent congressional testimony not to have received the information in time to do so before the public announcement.

Pace disclosed on May 8, 1952, that the U.S. army had developed a new atomic artillery weapon. On Aug. 13 he visited Marshal Tito in Yugoslavia, and reportedly discussed a plan for joint Greek-Yugoslav defense in case of attack by a soviet satellite.

Pacific Islands, British. Under this heading are grouped the crown colonies and protectorates administered by the high commissioner for the western Pacific and the governor of Fiji. Included are the colony of Fiji, the Gilbert and Ellice Islands colony, the British Solomon Islands protectorate, the protected state of Tonga and the Anglo-French condominium of the New Hebrides (*q.v.*). Areas: Fiji 7,040 sq.mi.; Gilbert and Ellice Islands 375 sq.mi.; Solomon Islands 11,500 sq.mi.; Tonga 250 sq.mi. Populations: Fiji (1946 census) 259,638, (1951 est.) 298,000; Gilbert and Ellice Islands (1947 census) 36,000, (1951 est.) 39,000; Solomon Islands (1951 est.) 101,000; Tonga (1951 est.) 48,000. Chief town: Suva (capital of Fiji), pop. (1946 census) 25,395. High commissioners for the western Pacific (1952): Sir Leslie Brian Freeston and (from July 3) Robert Stanley. Governors of Fiji, Sir Leslie Brian Freeston and (from Oct. 6) Sir Ronald Garvey. Ruler of Tonga, Queen Salote Tupou.

History.—A very severe storm struck the Solomon Islands on Jan. 25, 1952, and did a great deal of damage including the destruction of those wharf facilities at Honiara that had survived World War II. A temporary port was opened at Tulagi, and Gizo was also opened for ocean-going vessels. The Gilbert and Ellice Islands had an outbreak of poliomyelitis between February and May but only a few cases were fatal. On April 1 the administrative separation of the Western Pacific High commission from Fiji came into force, the high commissioner assuming responsibility for the Gilbert and Ellice Islands, the Solomons and the New Hebrides condominium; at the same time responsibility for Pitcairn and Tonga was transferred to the governor of Fiji.

The new high commissioner arrived in Fiji in July and left shortly afterward for a tour of the islands.

A severe hurricane also struck the Fijian islands on Jan. 28, wind speeds at times exceeding 150 knots. At least 13 people

were killed and Suva was extensively damaged. Sugar and banana crops suffered heavily and the gold mines were put out of production for several weeks. Food supplies, however, remained adequate and prompt assistance was given from overseas, particularly by New Zealand. Both the New Zealand and the British governments sent gifts of £10,000 to help to meet the cost of repairing the damage, the extent of which was estimated at more than £1,000,000. The 1st battalion, the Fiji regiment, consisting entirely of volunteers, arrived in Malaya in January and very soon established an excellent reputation in the war against the Communists. During the year, for the first time, five Fijian girls were admitted as students to the Central medical school.

(K. G. B.)

Education.—*Solomon Islands*: 1 government school at Auki; several mission schools. *Gilbert and Ellice Islands*: free compulsory education to 16; 234 primary schools (4 government, remainder mission), 8,108 pupils. *Tonga*: free compulsory education to 14; 132 primary, 10 secondary schools; 1 teacher training college. *Fiji*: 427 primary schools (48,000 pupils); 2 secondary schools; 2 technical schools (2,000 pupils); teachers' training college and Central medical school. Many pupils are sent from Gilbert and Ellice Islands and Tonga to Fiji and New Zealand for higher education.

Finance and Trade.—Currency: Australian pound, with local notes in Tonga only (£A1=U.S. \$2.24); Fijian pound (£F1=U.S. \$2.52).

	Revenue (1952 est.)	Expenditure (1952 est.)	Imports 1951	Exports 1951
<i>Solomon Islands</i>	£A480,508	£A460,949	£A800,872	£A916,511
<i>Gilbert and Ellice</i>	365,755	270,971	192,582	425,922
<i>Tonga</i>	443,832	443,832	889,373	1,388,564
<i>Fiji</i>	£F3,820,067	£F3,818,349	£F9,368,137	£F6,413,576

Main exports: copra; phosphate of lime (Gilbert and Ellice Islands); bananas (Tonga); gold and silver (Fiji).

BIBLIOGRAPHY.—*Introducing the British Pacific Islands*, H.M.S.O. (London, 1952); Sir Arthur Grimble, *A Pattern of Islands* (London, 1952).

Pacific Islands, French. Under this heading are grouped two overseas territories of the French union and the Anglo-French condominium of the New Hebrides (*q.v.*). Areas and populations are:

	Area (sq.mi.)	Population 1936 est.	1951 est.
<i>New Caledonia and dependencies</i>	7,654	53,245	63,000
<i>French Settlements in Oceania</i>	1,545	43,962	60,000

Population, *New Caledonia* proper (6,533 sq.mi.) and dependencies (1946): Melanesian with Polynesian admixtures; Europeans 18,737, mostly French; Javanese 8,600; Annamese immigrants 4,100. Seat of commissioner general: Nouméa (pop., 1946 est., 10,466). Commissioner general for the Pacific ocean in 1952, Raoul Angammaré.

The French Settlements in Oceania consist of the Society Islands (the largest of which is Tahiti), the Marquesas, Tuamotu and other smaller islands. Pop.: Polynesian, majority Christian; Europeans (1946) 1,700 (including 900 French and 500 British); Chinese immigrants 6,390. Seat of governor: Papeete (pop., 1946 est., 12,428) on Tahiti. Governor in 1952, R. Petitbon.

History.—New Caledonian affairs had previously been controlled by the general council which consisted of white colonists. The granting of electoral rights to the natives under the 1946 constitution seemed likely to change things considerably. But despite long debates in the national assembly in Paris in 1952, the composition of the future territorial assembly remained undecided: some wanted a double-college electoral system, others a single-college one. The single-college system prevailed in the French Settlements in Oceania.

Because many Javanese workers had been repatriated at the request of the Indonesian government, New Caledonia contemplated the introduction of 2,000 Japanese to work in the mines.

An international conference on South Pacific fisheries was held at Nouméa, the seat of the South Pacific commission. In the New Hebrides a French ethnologist investigated the interior of Mallicolo Island, previously unexplored.

Modernization work was in progress at Papeete. A complete

map of Tahiti and the Sous-le-Vent Islands was completed. (See also FRENCH UNION.)

Education.—Pupils and students (1952): *New Caledonia*, primary 10,000, secondary 500, technical 130, bursaries in France 35; *Oceania*, primary 11,500, secondary 300, technical 100, bursaries in France 23.

Finance and Foreign Trade.—(1951) *New Caledonia*: imports 1,027,000,000 fr. C. F. P. (including 450,000,000 fr. from the French union and 275,000,000 fr. from Australia); exports 688,000,000 fr. C. F. P. (including 500,000,000 fr. to the French union), mainly nickel, chrome and coffee. *Oceania*: imports 700,000,000 fr. C. F. P. (including 282,000,000 fr. from the U.S. and 208,000,000 from the French union); exports 643,000,000 fr. C. F. P. (including 440,000,000 fr. to France), mainly copra and phosphates. Monetary unit: franc C. F. P. (Colonies Françaises du Pacifique)=5.50 metropolitan francs. In 1952, the exchange rate was 350 metropolitan francs to the U.S. \$1.

Mining.—(Metric tons, 1951): nickel ore 252,000; chrome ore 88,000; manganese ore 20,000; phosphates 230,000. (Hu. De.)

Pacific Islands under Trusteeship: see MARSHALL, CAROLINE AND MARIANA ISLANDS; TRUST TERRITORIES.

Painting. Increasing opportunities for international cultural exchange in the arts were noticeable in 1952. Exhibitions of modern painting crossed national boundaries in greater number, and international conferences on the arts contributed to the spread of common understandings.

In the United States there was the usual quota of exhibitions of contemporary European painting. The major accomplishment was the Matisse retrospective, shown in New York, N.Y., Cleveland, O., Chicago, Ill., and San Francisco, Calif., and accompanied by a comprehensive and definitive catalogue of the life and work of Henri Matisse by Alfred H. Barr. The Cézanne exhibition, shown in Chicago and New York, made an important contribution to the understanding of the "father of modern painting." A retrospective exhibition of Wassily Kandinsky was presented by the Boston Institute of Contemporary Art and later travelled to other cities. The Carnegie International, consisting of 300 paintings from 23 nations, opened in Pittsburgh, Pa., on Oct. 16. After touring European countries to select the paintings, the director of the Carnegie institute remarked that "the exhibition is preponderantly abstract, since the wave of abstraction has struck all countries."

The 26th Venice Biennale international exhibition, June 14 to October 19, provided a comprehensive view of the vigorous Italian school, which was characterized by a preponderance of abstraction interspersed with communistic "social realism." Major prizes for painting were given to Felice Casorati, Bruno Cassinari and Bruno Saetti. The French painting section featured Raoul Dufy, who received the President's prize, Fernand Léger, Chaim Soutine and Henri de Toulouse-Lautrec. Germany stressed *Die Brücke* movement and Emil Nolde received a major prize. The Dutch section showed *De Stijl*. England emphasized Graham Sutherland and Edward Wadsworth. The United States presented only Edward Hopper, Yasuo Kuniyoshi, Stuart Davis and the sculptor Alexander Calder. Austria featured Alfred L. Kubin and Belgium Constant Permeke.

In connection with the Venice Biennale, a first international conference of artists was sponsored in September by U.N.E.S.C.O. (the United Nations Educational, Scientific and Cultural organization) "to study the practical conditions required to ensure the freedom of the artist." The section on painting was led by Georges Rouault and Jacques Villon.

In Paris a Festival of the Arts, sponsored by the Congress for Cultural Freedom, was organized in May to show the extent and quality of creative activity in the nontotalitarian nations. Simultaneously, an exhibition of "Masterpieces of the Twentieth Century," assembled from collections in the United States, was presented by the Musée de l'Art Moderne in Paris and later at the Tate gallery in London. A comprehensive exhibition of Mexican art was shown at the same Paris gallery in July and in the fall in Stockholm, Swed. In Salzburg, Aus., the Cultural

Left: EDITH HALPERT, director of the Downtown gallery, New York city, with four of the nine painters whose work was exhibited at the gallery in a 1952 show titled "Recent Arrivals." The nine young artists were selected by Mrs. Halpert during a cross-country search for new talent

Below: "STUDIO INTERIOR," by Paul Mommer, awarded the gold medal of the Audubon Artists during their exhibit at the National Academy of Design, New York city, early in 1952

Above: PRIVATE PAUL CALLE, and his painting, "Sad-eyed Little Girl," which won first prize for painting in a world-wide U.S. army art competition. Few of the entries dealt with army life or with abstractions: prize-winning pictures went on tour in the U.S. in 1952

Below: EXHIBITION of contemporary U.S. and European paintings from the private collections of U.S. business and professional men, held at the Dallas Museum of Fine Arts, Texas, in April 1952

festival in August included an exhibition of "Prints by American Artists Under Forty," which was subsequently shown at the Secession gallery in Vienna.

In February Paris had an opportunity to see 20 American *avant-garde* painters selected by Sidney Janis. The reaction of the Paris critics was generally adverse, implying immaturity and failure to comprehend modern art. In the United States this criticism seemed insincere to many, while others considered American painters neither inferior to nor very different from their French colleagues. With the increasing cultural interchange between Europe and America, the current "expressionistic abstraction" had become an international style; and the ever more widespread participation in painting had levelled off the product at a competent average, with no significant young leaders apparent in any country and no world centre of art.

The Museum of Modern Art in New York continued to foster the *avant-garde* movement in American painting with an exhibition entitled "Fifteen American Painters and Sculptors," emphasizing such artists as Jackson Pollock, Mark Rothko, Clyfford Still, William Baziotes and Bradley Walker Tomlin.

One of the best of the annual cross-section exhibitions of contemporary American painting was presented by the University of Illinois, Urbana. It revealed the more vigorous aspects of current production and was accompanied by public lectures, an impressive catalogue and \$7,500 in purchase prizes.

Although critic Dorothy Drummond found the 147th annual of the Pennsylvania Academy of the Fine Arts a "fairly true cross-section of United States art today," she reflected the views of many in observing that both the representational and abstract work manifested "its own brand of monotony." Yesterday's monotony, she stated in the *Art Digest*, is in the "paint-what-you-see" school, while today's "constant repetition—even of explosive forms, colors, and thoughts—breeds its own sameness."

While most exhibitions of contemporary American painting were overwhelmingly abstract or semiabstract, the director of the California Palace of the Legion of Honor in San Francisco, who toured the country to pick its fifth annual exhibition, stated, "There will be rather more representational art than previously and rather less of the non-objective or abstract. This reflects a trend that has become noticeable, to my eye, in American painting in general."

The *Philadelphia Inquirer* brought suit against the Barnes foundation of Merion, Pa., to compel it freely to admit the general public to its Museum of Modern Art, in view of its tax-free status. The corporation, founded by Albert C. Barnes, owned about 1,000 works of art valued at \$25,000,000, including about 200 Renoirs, 100 Cézannes, 75 Matisse and 35 Picassos. The suit received general support from art organizations and periodicals and from museum directors, critics and professors, many of whom claimed to have been excluded from visiting the collection. (See also ART EXHIBITIONS; ART SALES; MUSEUMS; SCULPTURE.) (L. D. L.)

Paints and Varnishes.

Paint production in the United States in 1952 was estimated at about the same as the corrected 1951 sales value of \$1,360,000,000. Trade sales paints and enamels continued in high volume while industrial finishes suffered a decline in the last half of the year, partly because of the steel strike. Sales of water-thinned paints continued to expand. Prices of paints had increased about 9% during the past four years.

Raw material shortages eased considerably. The supply of phthalic anhydride was improved by attaining part of the expansion goal of 60% or 140,000,000 lb. There remained, however, shortages of tin for paint containers and glycerine. Expanded

production of pentaerythritol and sorbitol offset in large measure the shortage of glycerine for paint vehicles.

As a result of the interest in odourless paint, many major oil companies offered odourless hydrocarbon solvents based on synthesis by alkylation. Aerosol bomb dispensers for paint, which were first introduced in early 1949, expanded to a sale of about 7,000,000 bombs in 1952. Industrial spraying of paint was benefited by the introduction of a high pressure, 300 lb. to 600 lb. per square inch spraying system, using no air and thereby minimizing the formation of overspray.

Blistering of house paint because of moisture moving outward through the wood against the paint became so widespread that the industry directed a major campaign to educate the public on moisture barriers and wall space ventilation. Failure of wall paints on some types of new plaster was found to be caused by exceptional slowness in cure or carbonation of plaster having a high content of magnesia.

New paint raw materials included cerium and zirconium driers to supplement scarce cobalt and the other established driers. Dibasic acids for plasticizers were scheduled for production by direct ozone oxidation of oleic acid. Rapidly increasing production of epoxylines resins from epichlorohydrin and dihydric phenols was further advanced by the on-the-job introduction of rapid air drying catalysts through a two-nozzle spray gun. These resins gained favour for high chemical and corrosion resistance.

A high shear viscosimeter measured in mass the viscosity decrease caused by the high shear developed in the ordinary brushing of paint. Another publication announced a hardness tester in which a sapphire tip was pressed by a fixed weight into a paint film on a rigid surface and the indentation measured with a sensitivity of .1μ through its attachment to and movement of the centre plate of a three-plate electrical condenser.

The scientific section of the industry's trade association promoted an industry-wide colour aptitude testing program for its scientists and technicians. (Jo. C. W.)

Pakistan.

A self-governing member of the Commonwealth of Nations, Pakistan is a federation of 5 provinces, 12 states and tribal areas. Areas and populations are shown in the table on the following page.

STUDENTS being trained in atmospheric physics in Pakistan, where research was being conducted on artificial rain-making as a possible aid in solving water shortage problems in arid parts of the country

Provinces and states*	Area (in sq.mi.)	Population (1951 census)	(1941 census)
Sind	50,443	4,619,000	4,175,500

Total, West Pakistan	311,406	33,568,000	26,730,900
East Pakistan (East Bengal)	54,501	42,119,000	41,880,000
Total	365,907	75,687,000	68,610,900

*Excluding Jammu and Kashmir.

Languages: Urdu, Punjabi, Sindhi, Pushtu, Baluchi and Gujarati in West Pakistan and Bengali in East Pakistan; English used for higher education. Religion: Moslem (72.9%); Sikh, Hindu, Christian, Parsee and other minorities. Chief towns (1951 census, prelim.): Lahore (849,000); Dacca (401,000); Rawalpindi (243,000); Multan (190,000); Lyallpur (180,000); Sialkot (152,000); Chittagong (126,000); Gujranwala (124,000); Peshawar (114,000). Governor general in 1952, Ghulam Mohammed; prime minister, Khwaja Nazimuddin.

History.—There was no serious disturbance of Pakistan's political stability and progress in 1952. The policy of co-operation in the Commonwealth of Nations and of cultural alliance with other Islamic countries was continued. The work of framing the final constitution went on. The constituent assembly had distributed the initial work among several committees, including one on basic principles, whose objective—to find a correct synthesis of the Islamic and modern secular states—necessitated a careful approach. The assembly therefore decided to invite suggestions from the public on the committee's first report. Many suggestions were received and considered. The delay in settling the constitution and electing a new central legislature had not prevented the assembly adopting such interim measures as the introduction of adult suffrage for the election of reformed provincial assemblies. The second election to be held on the new franchise was that in the North-West Frontier Province, the former centre of the Pathan separatist movement, and resulted in a remarkable victory for the government; 67 out of 85 seats were won by Moslem league candidates, including 2 women. In April 1952 the assembly prepared the way for an election in East Bengal by an enactment increasing the number of seats in the provincial assembly and abolishing the representation of special interests. On another question, whether Bengali as well as Urdu should be made an official language of Pakistan, a decision was postponed. The assembly had under consideration the report of a committee on constitutional reform in Baluchistan. Meanwhile the Baluchistan states, Kalet, Las-Bela and Kharan, agreed in April to amalgamate into a union with a legislative assembly and a council of rules assisted by a council of ministers.

Relations with India.—Any real improvement in relations with the Indian republic was prevented by the prolongation of the Kashmir dispute and the deep resentment which this nourished. There were other matters of dissension in connection with prepartition assets and liabilities, and in the legacy of difficulties left by the mass migrations, among them the problem of the disposal of the property of evacuees. There was, however, a continuance of the facilities for trade which had resulted from India's acceptance of the valuation of the Pakistan rupee and from the trade agreement of Feb. 1951. The latter remained in force till June 30, 1952, and was followed by a new agreement for the period to June 1953, signed in Aug. 1952. The basis of this differed somewhat from previous agreements in that it was not confined to certain scheduled commodities, but contemplated that licences for imports from, or exports to, the sterling or other soft-currency areas would also

be valid for trade between India and Pakistan; it also provided for the export of specified quantities or values of some scheduled commodities, including timber, railway material and certain types of machinery and categories of iron and steel from India and hides, skins and fish from Pakistan. But these special provisions did not include Indian coal or Pakistan jute, the two most important single items in the previous agreement. During the year ended June 1952 Pakistan had a large favourable balance in its trade with India.

Economic Position.—The first year of the national development program, which was incorporated in the Colombo plan, ended in June 1952. This six-year program was under constant review in the light of requirements and resources, but its general scope may be gauged from its original form, which was estimated to cost Rs. 2,600,000,000 divided between agriculture (32%), the three heads of transport, industry and fuel and power (totalling 57%) and supplementation of provincial provision for social welfare (11%). It included many large and long-term projects (involving preparatory work on surveys and detailed planning) such as irrigation and land settlement, 3 major hydroelectric power schemes and 6 jute and 24 cotton mills. But the speedier satisfaction of minimum requirements was provided for by giving priority to urgent specific items of the program, including some of the jute and cotton mill projects, and the expansion of thermal power pending completion of hydroelectric schemes. Moreover in 1952 there was already in some directions a modest measure of achievement; two smaller hydroelectric stations started functioning at Rasul in the Punjab and at Malakand in the North-West Frontier Province, where a third was nearing completion; a start was made with jute manufacture, and the original small cotton textile capacity had been doubled. For financing the first year of the program some external assistance was available from contributions under the Colombo plan, a loan of \$27,000,000 for railways from the International Bank for Reconstruction and Development and an offer of \$10,000,000 from the U.S. under the Mutual Security program; but the great bulk of the finance was found from internal loans subscribed during 1948–50, from normal revenues and from surpluses accruing during the boom and set aside for development. The government encouraged the use of private capital in industry by numerous fiscal concessions, and in the 1952 budget exempted from tax personal incomes (up to a generous maximum of total income) invested in industrial concerns. It also enlarged the sphere of state initiative by establishing an industrial development corporation which participated in new undertakings where large investment was required. The budget, presented in March by the new finance minister, Mohammed Ali, showed a surplus for the year 1951–52 of Rs. 76,000,000.

The economic misfortunes of 1952 included a partial failure of the wheat crop resulting from drought; not only was there no surplus, but considerable quantities had to be imported. The main trouble, however, was the recession in world commodity prices. Cotton prices began to give way in February, and in the summer the government, which in March had announced a policy of support, had to purchase some of the new crop which failed to find a market. The export duty on tea was reduced by the budget; and jute was also supported by government purchases and reductions of export duties, but this valuable export was severely hit not only by the general recession but by such special factors as the increasing use of substitutes and the development of jute production in India. The general position continued to deteriorate and led the government to impose credit restrictions, import controls and an increase in the duty on cloth. The report of the state bank for the year ended June 30, 1952, showed a reduction of Rs. 467,000,000 in the

gold, sterling and dollar reserves as a result of that year's transactions. The report emphasized the difficulty of the situation facing Pakistan, but expressed confidence that it could be overcome. (See also INDIA; UNITED NATIONS.) (J. WN.)

Education.—*Baluchistan.*—Schools (Oct. 1949): primary 186; secondary 23; private 4; European 2; institutions of higher education 1; total pupils 18,500. *North-West Frontier Province.*—Recognized educational institutions (1947-48): for males 1,059, students 101,377; for females 156, students 11,035. *Sind.*—Schools (March 1946): boys' primary 2,327, pupils 165,653; girls' primary 398, pupils 40,257; secondary: for boys 206, pupils 34,810; for girls 37, pupils 9,262. Universities in Pakistan (1949-50): mainly teaching 2 (Dacca and Punjab), students 34,101, professors and lecturers 287; mainly affiliating 2 (Peshawar and Sind), central professorial and supervisory staff c. 20.

Finance and Banking.—Budget: (1950-51 actual) ordinary revenue Rs. 1,237,000,000, ordinary expenditure Rs. 947,000,000; (1951-52 est.) ordinary revenue Rs. 1,163,000,000, ordinary expenditure Rs. 955,000,000. Internal debt (March 1951): Rs. 952,000,000. Currency circulation (July 1952): Rs. 2,103,000,000. Bank deposits (July 1952): Rs. 1,154,000,000. Gold and foreign exchange (July 1951): U.S. \$597,000,000. Monetary unit: Pakistan rupee, with an exchange rate of Rs. 9.27 to the pound sterling and Rs. 3.31 to the U.S. dollar.

Foreign Trade.—(Year beginning April 1, 1951) Imports: Rs. 1,931,000,000, exports: Rs. 2,302,000,000. Main sources of imports (April-September 1951): Japan 28%; U.K. 21%; India 9%; U.S. 6%. Main destinations of exports: India 35%; U.K. 13%; France 10%; U.S. 5%. Main imports (April-September 1951): cotton yarns and manufactures 42%; machinery and vehicles 17%. Main exports: raw jute 41%; raw cotton 31%; tea 4%; hides and skins 4%.

Transport and Communications.—Roads (1949): 55,913 mi. Licensed motor vehicles (Dec. 1950): cars 17,000, commercial vehicles 12,000. Railways (1950): 6,994 mi.; passenger-miles 5,456,000,000; freight ton-miles 2,500,000,000. Shipping (1951): merchant vessels of 100 tons and more 2,201; total gross tonnage 5,816,585. Air transport (1949-50): miles scheduled per week 136,030. Telephones (1951): 18,771. Radio receiving sets (1949): 75,000.

Agriculture.—Main crops (metric tons, 1951): rice 11,820,000; wheat 4,016,000; barley (1952) 164,000; maize 396,000; sugar, raw value, excluding palm sugar production (1952) 573,000; jute (1952) 1,148,000; cotton, ginned (1950) 253,000; linseed (1950) 10,000; rapeseed and mustard seed (1949) 282,000; sesame (1949) 34,500; chick-peas (1951) 700,000; tea (1950) 23,800; tobacco (1949) 66,800. Livestock (1947-48): cattle 24,296,000; buffaloes 5,600,000; goats 10,067,000; sheep 6,145,000; camels 454,000; horses 470,000; mules 41,000; geese 61,000; chickens 22,248,000; ducks (1949) 5,063,000. Wool production, clean basis (1951): 6,000 metric tons. Meat production (1950): 264,000 metric tons. Milk production (1949): 5,917,000 metric tons. Fisheries (1949-50): total catch 250,000 metric tons.

Industry.—Employment (1949): all industries 662,000; manufacturing 200,000. Fuel and power: coal and lignite (1951) 516,000 metric tons; crude oil (1951) 152,000 metric tons; electricity (1950) 164,400,000 kw.hr. Raw materials: chromite (1950) 18,700 metric tons; salt (1948) 339,000 metric tons. Manufactured goods (1951): cotton yarn 8,800 metric tons; cotton cloth 116,800,000 m.

Palaeontology. **Vertebrate.**—*General.*—The study of fossil vertebrate animals enjoyed significant progress during 1952. Extensive field explorations in many parts of the world continued. Success in a constant search for improved aids both for the mechanical preparation of fossils and for the handling of data was realized. The cumulative results, as revealed by a review of the annual bibliography, showed a gratifying increase of new and revised factual information as well as of subjective interpretation.

Fishes.—Based on materials chiefly obtained from an excavation made for the Firestone library at Princeton university, Bobb Schaeffer monographed the Triassic coelacanth, *Diplurus*, and discussed the general evolution of the Coelacanthini. The conclusions of this work prompted the same writer subsequently to investigate the rates of structural change and of taxonomic divergence of both this and the group of lung fishes during the long geologic interval from the Devonian to the Recent period. An important revisionary study of the early Devonian cephalaspids from Utah was undertaken by R. H. Denison in which was elaborated evidence of at least limited growth of the exoskeleton among certain of the Osteostraci. Other contributions to the historical and morphological knowledge of the fishlike vertebrates included: a report of upper Devonian arthrodires from the central mineral district of Texas (D. H. Dunkle and J. A. Wilson); a roentgenographic examination of the primitive Devonian fish *Lunaspis* verifying the macropetalichthyid affinities of the form (W. M. Lehman); a description of new ma-

terials of the late Palaeozoic xenacanthid sharks (N. Hotton); and a report of catfish remains from the late Tertiary of Austria (E. Thennius).

Amphibians.—In a paper on Upper Devonian vertebrates from eastern Greenland, which also described a new genus of rhipidistian fish, E. Jarvik defined a new family of ichthyostegoid amphibians and presented detailed observations on the postcranial skeleton of *Ichthyostega*. These oldest known tetrapods were shown to be intermediate between fishes and amphibians in a number of basic morphological characters. However, because of certain endocranial specializations unknown in any post-Devonian tetrapods, they were postulated to be blind phyletic offshoots of an older labyrinthodont stem. In his sixth contribution on the faunas of the Permian Vale and Choza formations of Texas, E. C. Olsen statistically analyzed skull materials of the horned amphibian *Diplocaulus*.

Reptiles.—The early tetrapod and fish fauna of Clear Fork age (Permian) served as the basis of a critical analysis by E. C. Olsen of the interrelated changes of speciation through time and varying environmental conditions. Ernest Williams described the skull of a staurotypine turtle from the early Oligocene and discussed the geologic range of all the known Chelydridae. Recently questioned by K. A. Kermack, the long-held belief that the giant sauropod dinosaurs of the Mesozoic era were chiefly amphibious in habit was defended on morphological and analogous grounds by E. H. Colbert. F. von Huene recognized a new ichthyosaur from middle Triassic sediments of Germany and P. E. Vanzolini studied various snake and lizard remains from the Lower Miocene of Florida.

Birds.—Morphological comparisons made by J. T. Gregory indicated that the presumed mandibles of *Ichthyornis* were actually those of an immature mosasaur. Their association with the type of skeletal restoration of this rare Cretaceous bird was therefore considered erroneous. In useful systematic practice Pierce Brodkorb designated for the first time types for 29 genera of fossil birds originally defined by K. Lambrecht.

Mammals.—An important publication by C. Couto dealt with early Tertiary marsupial remains from Brazil. F. Takai presented a graphical summary of the mammalian fauna of eastern Asia coupled with a discussion of the probable relationships of the continents of the northern hemisphere from Triassic to Recent times. Other studies of interest included a report by J. A. Wilson and others of the discovery of Palaeocene and Eocene mammals in Texas; additions to the Pleistocene fauna of Kansas and Oklahoma by C. W. Hibbard and G. Rinker; and an account by E. E. Williams of the faunal succession of sub-Recent fossils from Jamaica, W.I.

Great interest was again manifest in fossil primates. In this connection a number of contributions were concerned with the remains of associated contemporaneous animals (D. A. Hooijer, M. J. Noerrien and others). (D. H. D.)

Palaeobotany.—The year 1952 witnessed an unusual number of contributions to the existing knowledge of fossil plants. Rudolf Florin presented an excellent summary of the knowledge of the Chinese conifer *Metasequoia*. This was discovered in rocks of Tertiary age by the Japanese botanist Shigeru Miki and described in 1941. A few years later Chinese botanists published the results of their discovery of this tree (related to the modern redwood and bald cypress) living in central China. This sequence of events, the finding of a plant first as a fossil several million years old, later recognized as an element of modern flora, was most unusual. Its interest, however, was by no means confined to students of palaeobotany since the *Metasequoia* is a large and attractive deciduous conifer. Seeds had been distributed to horticulturists in many parts of America and Europe and reports indicated that the tree might prove to

be hardy through much of this area. Ralph Chaney completed a restudy of the redwood and cypress fossil remains from western North America and showed that many of them were those of *Metasequoia*, a true living fossil.

A new theory was presented by Daniel Axelrod, an authority of western Tertiary floras, to explain the origin of angiospermous (flowering) plants. The flowering plants constitute the dominant element of modern vegetation. Their origin, suddenly and in abundance, in rocks of Cretaceous age has been one of the puzzles of natural history. Discoveries of the remains of their supposed ancestors from pre-Cretaceous rocks have been few and have given no substantial clues as to the origin of this great group. Axelrod presented reasons which suggested that the angiosperms were in existence in upland tropical regions as early as Permo-Triassic times.

Several notable contributions were made as a result of continued studies of the petrified plants found as coal balls in the central American coal fields. Two seeds were described, one from Illinois and the other from Kansas, which displayed new preservation of even the most delicate tissues. Several new coenopterid ferns were described from the same source. These were of importance since they were members of a primitive complex which probably gave rise to certain seed plants and several families of true ferns. Recently rather abundant remains of articulate stems and cones had also been reported from coal balls. These were distant relatives of the modern horsetails (*Equisetum*) and they formed a significant element of the American Carboniferous floras.

Referring to ferns of more recent times, it may be noted that two species of *Osmunda* had been described from the Eocene of Oregon. Members of this (cinnamon fern) family are known to have originated in late Palaeozoic times and are of particular interest because they compose an important element of modern flora. The cinnamon, interrupted and royal ferns are especially common in the eastern United States.

The *Manual of Phycology* (Chronica Botanica Co., 1951) included a chapter on fossil algae by Harlan Johnson which briefly summarized existing knowledge of this group. Certain of the algae, like the corals, are of great importance as rock builders.

An event of particular importance in palaeobotany during the year was the announcement by the palaeontology and stratigraphy branch of the U.S. geological survey that the *Compendium Index* of fossil plant names had been made available in microfilm copies. This index was a nearly complete compilation of names applied to fossil plants from 1820 to 1950 and was accompanied by an extensive bibliography of palaeobotanical literature. (See also BOTANY.)

Palestine: see ISRAEL; JERUSALEM; JORDAN; UNITED NATIONS.

Panamá. A republic on the isthmus joining the continents of North and South America, Panamá is bounded on the north by Costa Rica and on the south by Colombia, and is bisected by the Panama Canal Zone, which is leased to the United States. Area: 28,575 sq.mi.; pop. (1950 census of the Americas): 805,000, both exclusive of the Canal Zone. The capital is Panamá city (146,117 in 1949); other principal cities are Colón (54,334), David (13,656) and Santiago (6,944). Language: Spanish; religion: predominantly Roman Catholic.

PANAMÁ CITY policeman who was unseated when his horse slipped on corn kernels scattered by rioting students. The students were demanding an extension of the school term, in Feb. 1952, to make up for time lost during a two-month teachers' strike

Presidents in 1952: Alcibiades Arosemena until Oct. 1; thereafter Col. José Antonio Remón (*q.v.*).

History.—Following the chaotic events of 1951, Panamanian politics moved toward a more stable keel in 1952. Former Pres. Arnulfo Arias, who was forcibly deposed in 1951, was released from prison on Feb. 7 on condition that he never hold public office in Panamá again. On March 28 the Federal Trust company, which Arias had closed the year before in an action which precipitated his ouster, reopened its doors. Thereafter, Panamanians prepared for the presidential election held on May 11. The proadministration candidate was Colonel Remón, who had led the coup which unseated Arias. Remón had two major political assets—the loyalty of the 3,300-man national police, Panamá's only armed force; and the political activity of his wife, Cecelia, whose campaigning was reminiscent of Argentina's Eva Perón. Two other candidates entered the presidential race. These were Roberto Francisco Chiari, standard-bearer of the Civil Alliance, and Pedro Moreno Correa, the Conservative candidate. Election day, May 11, was relatively peaceful. According to the official returns, Remón received 133,208 votes as against 78,094 cast for Chiari and 1,957 for Moreno Correa. Accordingly, Remón was inaugurated as Panamá's new president on Oct. 1. (G. I. B.)

Education.—In the school year 1951–52 there were 904 public primary schools with 3,153 teachers and 110,038 pupils, 20 secondary schools with 718 teachers and 15,963 students and 7 vocational schools with 253 teachers and 5,552 students. In addition, there were 70 private primary schools with 200 teachers and 5,544 students and 57 secondary schools with 292 teachers and 5,474 students. The national university had 1,805 students. About 25% of the 1952 budget was earmarked for education.

Finance.—The monetary unit is the balboa, at par with the U.S. dollar. The national budget for 1951 (continued in effect during 1952) estimated ordinary expenditure at \$33,464,433 and revenue at \$33,463,354. Additional expenditures of \$700,564 had been authorized by May 31, 1952. Total expenditure in 1951 was \$34,480,984; revenue, \$34,479,981. The national debt on Dec. 31, 1951, totalled \$34,574,125, of which \$10,946,902 was external and \$23,627,223 internal. The cost of living index (food, Panamá city) stood at 95 in Aug. 1952 (1948=100).

Trade and Communications.—Domestic exports in 1951 totalled \$11,690,008; imports, \$66,121,893. Chief exports were bananas (48%), abacá (10%) and cacao (8%). The leading customers were the U.S. (81%), Venezuela (5%) and El Salvador (5%); leading suppliers were the U.S. (69%), the Canal Zone (7%), the United Kingdom (4%) and Canada (2%). The traditionally adverse balance of trade is generally offset by invisible exports to the Canal Zone in the form of tourist expenditures,

sales to ships and wages of Panamanians employed there.

Railroad mileage is 223. Highways in 1949 totalled 1,071 mi., of which 348 mi. were paved. According to *Lloyd's Register of Shipping*, the merchant marine consisted of 607 vessels (100 tons and over) aggregating 3,609,395 gross tons on June 30, 1951.

Agriculture.—Exports of bananas in 1951 were 4,896,776 bunches, almost all of which went to the U.S. Exports of other export crops included abacá 2,984 metric tons and cacao 1,327 tons. Production of rice (rough) was about 85,000 tons in 1951-52. The 1950 census showed 576,488 cattle and 198,511 pigs.

Manufactures.—Production figures in 1951 included beer 14,695,960 l.; rum 756,665 l.; sugar 16,600 short tons. In 1951, 74,755,000 kw.hr. of electric energy were generated in Panamá city and 13,408,000 kw.hr. in Colón. (J. W. Mw.)

Panama Canal Zone. A United States military reservation embracing a ten-mile strip across the Isthmus of Panama, leased for the protection and administration of the Panama canal, the Panama Canal Zone has an area of 553 sq.mi., including 191 sq.mi. of fresh water. Population, exclusive of uniformed military personnel (1950 census): 52,822. Administrative centre: Balboa Heights (pop., 1950: 363). Governors in 1952: Brig. Gen. Francis K. Newcomer; (from May 27) Brig. Gen. John S. Seybold.

History.—During 1952 considerable attention was devoted to economic development in the Canal Zone. Extensive plans were formulated for an International Commercial exposition, to open in Feb. 1953. The exposition was expected to focus attention on the zone's facilities, and to attract new commercial and industrial enterprises to the area. Brig. Gen. Newcomer's term of office as governor expired during the year and Pres. Harry S. Truman appointed Brig. Gen. John S. Seybold to succeed him. Seybold was sworn in on May 27 and took office on June 9. (G. I. B.)

Education.—In Feb. 1951 there were for white students 14 schools with an enrolment of 4,368 students and a junior college with an enrolment of 149 daytime students. For nonwhite students there were 13 schools with an enrolment of 3,592, and a junior college.

Finance.—Total canal revenues for the fiscal year 1950-51 were \$24,121,068.26; net expenses, \$22,731,829.15; and net capital investment as of June 30, 1951, \$626,708,619.65. During the year 5,593 ships (300 net tons and over) aggregating 27,180,425 canal net tons passing through the canal carried cargo of 30,073,022 long tons and paid tolls of \$23,906,082. Of the cargo carried, 11,132,472 tons were east to west and 18,940,550 tons west to east. Canal net tonnage of vessels by nationality included U.S. 12,469,276; British 5,780,215; Norwegian 2,325,651; Panamanian 1,009,948; and Honduran 906,398. Employees of the canal and the railroad on June 30, 1951, included 4,216 paid at U.S. rates and 14,519 paid at local rates. (J. W. Mw.)

Pan American Union: see ORGANIZATION OF AMERICAN STATES.

Paper and Pulp Industry. The estimated production of paper and paperboard in the United States for 1952 was about 25,000,000 tons as contrasted with 26,086,115 tons in 1951.

In production and consumption the decrease indicated for 1952 was the result of reduced buying by the federal government for defense purposes. An easing in domestic demand was also noted.

Of particular interest to the industry was the expansion under way in production capacity. Between Jan. 1951 and Jan. 1956 this was expected to amount to 978,050 tons of coarse paper, 101,060 tons of book and groundwood papers, 106,950 tons of tissue paper, 66,650 tons of fine paper, 267,220 tons of newsprint, 775 tons of miscellaneous papers and 1,873,330 tons

Table II.—U.S. Paper Production

	(In short tons)			
	1940	1945	1950	1951
Newsprint	1,056,304	725,475	1,017,322	1,106,086
Book	1,655,423	1,501,015	3,286,047	2,737,000

of paperboard and building board.

Canada.—The pulp and paper industry in Canada attained new peaks in 1951 and continued its expansion into 1952. It became the world's leading exporter of pulps. Between 1950 and 1955 new investment in pulp and paper mills was expected to exceed \$600,000,000, which in dollar terms was 70% greater than the growth of the industry in the preceding five years.

United Kingdom.—Paper and board continued to be controlled during 1952, both as regards tonnage and selling prices. The greater part of the production consisted of newsprint, although because of war damage these mills were still able to produce only 70% of the pre-World War II output of 800,000 tons per year. Before the war, Great Britain used 1,200,000 tons of newsprint a year. In Jan. 1952 it was reported that 180,000 tons of straw would be consumed in papermaking during the year. (R. G. M.)

Papua-New Guinea. From 1949 the territory of Papua and the trust territory of New Guinea have been administered as a single area by the Australian commonwealth government. Areas: Papua, 90,540 sq.mi.; New Guinea, 69,700 sq.mi.; New Britain, New Ireland, Admiralty Islands and certain of the Solomon Islands included in the trust territory, 23,300 sq.mi. Pop.: Papua

Table I.—U.S. Production and Consumption of Paper, Wood Pulp and Pulpwood

(1941 est.) native 300,000, white 3,070 (1951 est. total, 369,000); New Guinea (including the islands) native 690,000, white 4,200 (1951 est. total, 1,103,000). Capital of joint administration, Port Moresby. Administrator in 1952, Col. J. K. Murray.

History.—The legislative council for Papua-New Guinea, opened in Nov. 1951 by the governor of New South Wales, Sir John Northcott, was described during 1952 as a "short step" toward democratic government in the territories. Another observer, however, G. W. Holland, president of the Returned Soldiers association, expressed the opinion that the territories should be included in the commonwealth of Australia as another state. It was clear that the council was deficient in powers and representative nature. All its ordinances had to receive the assent of the administrator of the territories before becoming law, and each had to be tabled in the commonwealth parliament at Canberra and might be disallowed by it. Further, the governor general might disallow any ordinance despite the administrator's consent, and the administrator had to refer to the governor general the matters of divorce, land transactions involving natives, money or land grants, disposal of land or any interest in it, defense forces, employment of natives, arms, ammunition, explosives, intoxicating liquor, opium, immigration, emigration, deportation and the public service.

Economic development of the area continued both extensively and intensively and coffee exports took place during the year. In June the commonwealth government decided to change the decision of its predecessor to establish the capital at a new site and to rebuild the capital Rabaul on its old site. This was the outcome of acceptance of expert opinion that Rabaul was safe from volcanic action.

During the year Australian administration of the territories of Papua-New Guinea was criticized before the United Nations. The validity of the criticism was denied by the Australian representative. Indonesia renewed during the year its claim for the territory of Dutch New Guinea but the Australian representative stated that Australia both recognized Dutch sovereignty over the area and considered it should continue. This was related by the representative to what he considered the most important matter, the prevention of the spread of Communism in southeast Asia.

(J. F. C.)

Economy.—*Papua.*—Finance and Trade.—(1949–50) Total revenue fund £A3,071,145 (Australian government grant £A1,903,313); expenditure £A2,325,203. Total imports (1949–50) £A4,684,028; exports £A1,202,694. Principal exports (1949–50 values): rubber £A361,339; copra £A574,511; coconut, desiccated £A58,321; gold bullion and Nahwe gold £A10,875. Principal imports: metals and machinery £A1,605,347; agricultural products and groceries £A1,134,129; oils, paints and varnishes £A338,247; tobacco and tobacco manufactures £A214,427. Agriculture.—(production in tons, 1949–50): rubber 1,634; copra 10,191; coconut 318; coffee beans 6. *New Guinea.*—Finance and Trade.—(1950–51) Internal revenue £A1,219,411 (Australian government grant £A2,356,311); expenditure £A3,575,721. Total imports (1950–51): £A6,186,669; exports (incl. exports not of local origin): £A5,436,617. Principal exports of local origin (1950–51): cocoa beans £A60,934; coconut, desiccated £A95,024; copra £A936,601; gold £A145,393; trochus shell £A95,709. Principal imports: metals, machinery and metal manufactures £A1,350,608; food and drink £A1,779,791; oils, fats and waxes £A514,890. Agriculture and Mining.—(1950–51) desiccated coconut 939 tons; copra 641,301 tons; cocoa beans 317 tons; coffee beans 32 tons. Timber (cu.ft.): logs 1,894,459; sawn 1,670. Gold: 87,593 fine ounces.

Currency.—Australian pound used throughout Papua-New Guinea (£A1.25 = £1 sterling. £A1 = U.S. \$2.24).

Paraguay. A landlocked republic in central South America, Paraguay is bounded north and east by Brazil, south by Argentina and west by Bolivia. Area: 157,047 sq.mi., of which 95,338 sq.mi. constitute the sparsely populated Chaco, while the 61,709 sq.mi. lying east of the Paraguay river contain 95% of the population and activity. Pop. (1950 census): 1,406,000; (1951 est.): 1,425,000. The people are a homogeneous mixture of Spanish and Guaraní stock (with some Portuguese and Italian) which has developed into a racial type. Official language, Spanish. The Guaraní tongue has survived

more than the blood, but is secondary and recessive. Capital and chief centre: Asunción, pop. (1950) 205,605 including suburbs. Other cities: Villarica (31,081) Concepción (16,487), Encarnación (16,078). Official religion: Roman Catholic. In 1952 the president was Federico Chaves.

History.—In 1952 the executive power and the house of deputies continued in the hands of the recently purged Colorado party, which held its convention in June and proclaimed Federico Chaves its candidate for the period 1953–58. No significant disorders of political or military origin had occurred since Chaves took control late in 1949. The Paraguayan Confederation of Workers, established in July 1951 with 80,000 members, had been supported by the government in connection with sporadic labour strikes, and had avoided affiliation with the labour movement organized by the Perón regime in Argentina. The vigorous governmental program of economic improvement made substantial progress in fostering new industries and rehabilitating old ones. The International Bank for Reconstruction and Development late in 1951 granted Paraguay a loan of \$5,000,000 for agricultural development, elaborately planned and in part under way. The International Monetary fund, at the invitation of the Paraguayan government, sent a special mission to co-operate with the Bank of Paraguay on matters related to the monetary and foreign exchange system, and the implementation of its proposals appeared imminent.

Education.—In 1949, 1,262 primary schools were recorded, with 5,479 teachers and 186,101 pupils. There were 41 secondary schools, including 12 normal schools. There were in 1951 four regional agricultural schools; and at San Lorenzo, near Asunción, the Estigarribia National School of Agronomy. A national junior college at the capital had several hundred students, and the national university at Asunción had in 1950 approximately 1,800 students and 100 professors.

Finance.—The currency unit is the guaraní, devalued March 5, 1951, from 3.09 to 6 per U.S. dollar. The government-affiliated bank, which controls all exchange, used the latter rate for the most essential imports and the principal exports, but used the rate of 9 guaraníes per U.S. dollar for less essential imports, minor exports and movements of registered capital. Black market rates ranged around 32 guaraníes per U.S. dollar as 1952 opened. The 1951–52 budget was \$28,300,000 (converting guaraníes at the official rate); of this, \$7,500,000 was for national defense, \$5,000,000 for public debt, \$4,500,000 for internal order and \$3,750,000 for education. Estimated revenues were \$23,700,000. Early in 1951 the total public debt was \$27,000,000, of which \$7,000,000 was external and \$20,000,000 internal. At the opening of 1952 Paraguay was current on all its foreign obligations, except a loan from Brazil on which a settlement was impending. At the same time the monetary issues in Paraguay were \$56,000,000, against reserves of \$13,600,000 of which about \$2,000,000 were in gold. Aggregate assets of the four commercial banks at the beginning of 1952 were \$89,000,000, with capital funds standing at \$5,500,000 and deposits at \$42,650,000.

Trade.—Paraguay's exports in 1951 were valued at \$35,100,000 and imports at \$33,300,000. In 1950 the chief exports were lumber \$7,450,000, cotton \$5,400,000, quebracho (tanning extract) \$4,650,000 and canned beef \$3,250,000; while lesser but substantial exports were hides, vegetable oils, tobacco and essential oils. The principal imports were nontropical foodstuffs, textiles, machinery and metal manufactures, petroleum products, chemicals and drugs and paper. Argentina held first place among the destinations of exports, followed by the United States, Great Britain, Germany and Uruguay; but the Netherlands, Belgium, France and Spain also figured. The principal suppliers of imports were Argentina, Great Britain, the United States, Germany and Sweden; while of less importance were the Netherlands, Italy, France, Belgium and Brazil. Both Great Britain and Germany gained strongly in sales during 1951, while the United States declined slightly.

Communications.—The Paraguay Central railway runs 278 mi. S.E. from Asunción through the best farm and forest areas to Encarnación on the upper Paraná, where it connects by car ferries with the Argentine railways at Posadas. Traffic in late years averaged about 2,000,000 passengers and 260,000 tons of freight. Passenger fares were raised 30% in 1951 and freight rates 50%. There were more than 550 mi. of modern gravel-crowned highways, plus 80 mi. of asphalt, with about 4,000 mi. of primitive roads. The number of automotive vehicles at the beginning of 1950 was 3,150, of which 1,800 were passenger cars, 1,000 were trucks and 300 were buses. The importation of automotive vehicles was prohibited in 1951, and tires and gasoline were rationed so that many vehicles went out of commission. While river transport is active everywhere in Paraguay, the Argentine Doderro line carries by far the greatest volume, the last published estimate (1948) being 490,000 tons. The Paraguayan state merchant fleet, consisting of one tanker and three cargo boats, carried in 1950 southbound to Argentina 10,400,000 cu.ft. and northbound 14,600,000 cu.ft. There were 5,111 telephones in Paraguay at the opening of 1951, and the national telegraph system had 3,700 mi. of wire and joined 118 population centres. There were several broadcasting stations at Asunción, and between 25,000 and 30,000 radio receiving sets. Aeroplane connections with Argentina and Brazil were increased in 1951 and a service to Santiago, Chile, by a Brazilian line was newly established.

Agriculture.—Agriculture is the principal basis of Paraguay's economic life, and in 1951 there were about 900,000 ac. in crops. The production in tons was: mandioca 970,000, sugar 561,000, maize 119,000, sweet potatoes 81,400, cotton 36,400, rice 19,800, cowpeas 18,000, peanuts 13,600, vegetable oils 11,000 and tobacco 8,800. The citrus fruit crop was more than 13,000,000 boxes, of which oranges formed the greatest part. Cattle declined to 3,400,000 head in 1950, compared with 5,000,000 head in 1947, and this decline continued in 1951. The number of horses in 1951 was 250,000 and the number of sheep 200,000.

Manufactures.—The chief manufactured products were canned meat and textiles. The meat plants were closed in 1951 because of a shortage of cattle. The textile mills showed considerable expansion over 1950, when the three largest mills produced 2,500,000 m. of cotton cloth and 1,600 tons of cotton yarn as well as good quantities of woollens and silks. Six new plants for the crushing of oilseeds and palm kernels were installed in 1951. Other products were flour, beer, shoes, furniture, soap, glass and ceramics, matches, cigarettes and processed foods. A new spaghetti plant was opened in 1951, as well as a pharmaceutical plant under Swiss auspices principally to make antibiotics.

Mines and Forests.—Paraguay's principal mineral resources are limestone, kaolin and mica (the latter not yet in production). The production of cobblestones and crushed stone in 1951 was more than 50,000 cu.yd. Construction was well advanced on a cement plant at Valle Mi, which was expected soon to make Paraguay self-sufficient as to cement with an output of 100 tons daily. The output and export of hardwood lumber was somewhat lower in 1951 than 1950 when exports (nine months) were 200,000 tons; but value increased strongly over the 1950 (nine months) figure of \$7,000,000. The production of quebracho tanning extract rose to 44,000 tons in 1951, valued at nearly \$7,000,000. (W. Fr.)

Parents and Teachers, National Congress of: see SOCIETIES AND ASSOCIATIONS, U.S.

Paris. Capital and largest city of France, Paris had by the 1946 census a population of 2,725,374, estimated to have increased by about 100,000 by 1952. President of the municipal council (1952): Paul Coirre.

Anniversaries celebrated in Paris during 1952 included: the 20th of Aristide Briand's death (March); the 100th of the gynaecologist Joseph Récamier's birth (June); and the 100th of the birth of Pierre Marie, collaborator with, and successor to, the great physician Jean Martin Charcot (July). Louis Braille's ashes were moved to the Panthéon (June 22).

The housing problem remained acute, and the number of people obliged to live in hotels or in furnished rooms let at excessive rents was only gradually diminishing. The municipal council's plan had envisaged building 5,000 flats a year from 1951. The council asked the state to authorize its floating a loan of 10,000,000,000 fr. to enable it to go forward with the undertaking.

The number of pupils attending kindergarten and primary schools and complementary courses rose to about 450,000. Some primary classes had 50, 60 or even 70 children. To meet the growing need the council would have to build new educational centres, for which 2,500,000,000 fr. would be required; as in the case of housing, it was waiting for the state's permission to raise a loan. The council's budget for 1952 was estimated at 63,000,000,000 fr. Excess expenditure was covered by raising the taxes on real estate and on business houses and instituting new *centimes additionnels* (rate charges).

The cost of living index varied little in 1952, though the price of dairy produce went up. The butchers keenly resented the prices fixed for meat by the prefecture of police: in September and October a dozen butchers' shops were shut for periods of one or two weeks. Teachers, hospital staff and employees of the *métro* and road services were trying to get their wages increased. (A. Pr.)

Parks and Monuments: see NATIONAL PARKS AND MONUMENTS.

Parliament, British. On the morning of Feb. 6, 1952, King George VI died, and immediately the sittings of both houses of parliament were cancelled. On the same day members began to take the oath of allegiance to Queen Elizabeth II. Messages of condolence to the

TORCHLIT PARADE in Paris accompanying a cortege for Gen. Jean de Latre de Tassigny as it left the Arc de Triomphe early in 1952. The streaks of light (a time exposure) indicate the path of mounted torchbearers

queen and to the queen mother were passed and both houses resumed normal business on Feb. 19. The session ended on Oct. 31 after a summer recess from Aug. 2 to Oct. 14. Queen Elizabeth delivered her first speech from the throne on Nov. 4 when she opened the new session. The duke of Edinburgh sat on a chair of state near the throne, thus reviving the practice of the prince consort a century before.

H. F. C. Crookshank, minister of health and leader of the house of commons, vacated his portfolio and became lord privy seal. On March 1 Earl Alexander of Tunis (who was raised from a viscount) became minister of defense. A. T. Lennox Boyd succeeded J. Maclay as minister of transport and civil aviation; I. Macleod became minister of health, and the marquess of Salisbury succeeded Lord Ismay (*q.v.*) as secretary of state for commonwealth relations.

During an all-night sitting (March 26-27) Mrs. E. Braddock (Liverpool, Exchange) was suspended after she had refused to obey the order to withdraw from the chamber. In the period of three or four weeks before Easter the house of commons sat after 10:30 P.M. (its normal hour of adjournment) for a total of 58 hr. 11 min. The guillotine was imposed on the National Health Service bill and the Licensed Premises in the New Towns bill.

The house of commons approved a new civil list for the reign of Queen Elizabeth. A Labour party amendment that sought to have a review every ten years was defeated by 239 votes to 211.

Four viscounts were created in the new year honours: Viscount Waverley (Sir John Anderson), Viscount Bracken (Brendan Bracken), Viscount Hudson (R. S. Hudson) and Viscount Thurso (Sir Archibald Sinclair). Earl Winterton was created a baron of the United Kingdom. In the birthday honours (June 5), two viscounts and two barons were created: Viscount Brookeborough

(Sir Basil Brooke, prime minister of Northern Ireland), Viscount Norwich (Sir Alfred Duff Cooper), Lord Jeffreys (Gen. Sir George Jeffreys) and Lord Simonds, the lord chancellor.

Commonwealth.—The new Nigerian house of representatives was formally opened on March 11. In the New Zealand house of representatives a member was suspended for a day for refusing to withdraw a statement; this was the first parliamentary suspension since 1932.

(See also CABINET MEMBERS; GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF; LAW.)

Pashtunistan: see AFGHANISTAN.

Patents. During the fiscal year ending June 30, 1952, the United States patent office granted 46,531 patents, including 3,344 for designs, 91 for plants and 133 reissues. This number was 3,719 less than the number issued in 1951.

Applications for patents filed in the patent office for the fiscal year totalled 64,992, compared with 68,108 received in the preceding year. The total number of patent applications pending on June 30, 1952, was approximately 190,000, of which about half were awaiting action by the office, the remainder being under rejection awaiting response by applicants, or in interference or appeal proceedings.

Trade marks registered (16,400) and renewed (3,314) during 1952 totalled 19,714, compared with 21,356 during the preceding year. In addition 1,304 registrations were published. Applications for registration and renewal totalled 19,509 compared with 19,272 for the preceding year. On June 30, 1952, approximately 30,000 applications for registration, renewal and republication were pending in the office, of which about half were pending before the examiners.

By June 30, 1952, the patent office had granted more than 2,600,000 patents since the consecutive numbering system began in 1836. Patent no. 2,000,000 expired in April 1952; and the inventions disclosed in these more than 2,000,000 expired patents represent a reservoir of knowledge available for the free use of anyone, as well as a historical chronology of a phase of the industrial development of the United States. Complete classified and numerical sets of United States patents are available for the use of the public in the patent office search room. Printed copies of patents are sold for 25 cents each.

More than 63,000 patents had been listed on the register of patents available for licensing or sale—the new listings being published in the weekly issues of the *Official Gazette*.
